Significant differences between military and nonmilitary regime systems are found on all the background economic variables. These differences, however, are directly attributable to the influence of the high-income systems. Such differences disappear when the high income systems are removed from the analysis. Although the military regime systems do score consistently lower than the nonmilitary regime systems, none of these differences is significant. Further, when military and nonmilitary regime systems are compared across the background variables within GNP levels, no significant differences occur. There is, therefore, no indication that military regime systems have a

penditure are 65 per cent and 59 per cent respectively. The independent variables for size are the dummy variable, diversification, expenditure, GNP, rate of growth of GNP, budget and international liquidity. The variables for expenditure are identical to the above except that size of the military is substituted for expenditure.

[20] The differences are the following: Sub-Saharan Africa, where the low-income nonmilitary regime systems rate of growth of expenditure is significantly higher at the .05 level; Central America, where the rate of growth of size is significantly higher in the military regime systems at the .10 level; South America, where the size in the low-income nonmilitary regime systems is significantly higher at the .10 level.

[21] For example, military size in military regime systems and low-income nonmilitary regime systems ranges from 9.6 and 9.2 in Africa to 91.1 and 94.0 in Asia; expenditure ranges from 0.87 and 1.40 in Central America to 6.86 and 6.30 in the Middle East and North Africa. Diversification ranges from 2.34 and 1.94 in Africa to 29.0 and 32.0 in South America. Rates of growth of size range from 4.30 and 1.35 in Central America to 13.8 and 11.7 in Africa. Rates of growth of expenditure range from 3.10 and 1.70 in Central America to 12.3 and 19.3 in Africa.

weaker background economic position than the nonmilitary regime systems.

Area controls, however, do indicate some differences between military and low-income nonmilitary regime systems which was not the case using military variables. The military regime systems in Africa and Asia particularly seem to be located in the weaker economic systems of these two areas. The within-area differences correspond to the within-area political differences where Africa and Asia demonstrated the most pronounced differences between military regime systems and nonmilitary regime systems.[22]

While there is no evidence that military regime systems are confined to weaker economic systems, the general literature on development indicates that some association exists between weaker economic systems and the number of coups or the duration of the military regime in military regime systems. However, analyses of variance both of regime duration and the number of coups on the five background economic variables yield no significant results. Further, all the correlations between regime duration or the number of coups and the economic variables have negligible values. Thus, once the high-income systems are removed, military regime systems are not located in the weaker economic systems. Nor are the systems characterized by multiple coups or long-term military regimes associated with weaker economies.

International Economic Performance

In contrast to the general background economic factors, there is some limited evidence to indicate the military regime systems are in a somewhat weaker international trading position than low-income nonmilitary regime systems.

Nonmilitary regime systems have more extensive commitments to international trade (as measured by export and import levels) and better trading positions (as measured by the trade balance). International liquidity and direct investment are very similar in both types of system. Military regime systems have significantly higher central government capital balances. When the high-income systems are removed, the low-income nonmilitary regime systems still have a significantly stronger commitment to international trade; however, their trade balance, while stronger, is not significantly so. Both direct investment and central government capital balances change markedly. The low-income nonmilitary regime systems now have a significantly higher direct investment balance, but central government capital balances are similar. International liquidity similarities remain essentially unchanged. Thus in contrast to the background economic variables, the removal of the high-income systems does not eliminate all the significant differences between military and low income nonmilitary regime systems.

Controls for GNP, however, lessen the differences between military and low-income nonmilitary regime systems. Controlling for GNP, partial correlations do show a weaker relationship than the total correlations between the occurrence of a military regime and the six international trade variables. Even adjusting for GNP, however, there is still a significant negative relationship between military regime systems and international trade commitment.[23] Furthermore, although first-order partial correlations controlling for GNP do not show a significant relationship between military regime systems or direct investment balances, multiple regression analysis indicates that the occurrence of a military regime is a significant negative estimator of trade and direct investment bal-

[22] In Africa, military regime systems have lower GNP, lower GDFCF and fewer doctors. Each difference is significant at the .10 level. In Asia, military regime systems have lower GNP, smaller budgets and fewer doctors. The differences are significant at the .05 level.

[23] The partial correlations between type of regime and exports and type of regime and imports controlling for GNP are −.23 and −.19, respectively, significant at the .01 and .05 levels.

ances (at the .10 and .05 levels respectively).[24]

When GNP is held constant, however, by comparing military and low income nonmilitary regime systems within GNP levels, the differences are not as clear as would seem from above. Although military regime systems have lower levels of exports and imports than low income nonmilitary regime systems in each of the GNP categories, the differences are pronounced only in the middle GNP level. No significant differences appear on trade balance in any of the GNP levels, and military regime systems in the high GNP level have a stronger trade balance than their nonmilitary counterparts. Since the trade balances of the military and nonmilitary regimes in the middle GNP level are almost identical, the aggregate difference must be attributable only to the score of the

[24] The regressions on trade balance and direct investment balance are both significant at the .01 level. In the former, 58 per cent of variance is explained and in the latter, 40 per cent. The independent variables are the dummy of whether a military regime has occurred, GNP, rate of growth of GNP, exports, international liquidity, central government capital balance. Direct balance and trade balance were alternatively used where appropriate.

military regime systems in the low GNP level. The direct investment balances of both types of regime system in both the low and middle GNP levels are almost identical, thus, the aggregate difference in direct investment balance must be attributable largely to the significantly lower balance of the military regime systems in the high GNP level. No significant differences appear for central government capital balance and international liquidity.

Thus, when GNP controls are introduced, military regime systems in aggregate terms do seem to have a weaker commitment to international trade, but this weaker commitment is primarily restricted to the middle GNP levels. The evidence indicating that military regime systems have weaker trade balances is not particularly strong. The evidence indicating they have lower direct investment balances, however, is stronger, but this, too, seems to be restricted to only the high GNP level. The aggregate similarities in terms of central government capital balances and international liquidity remain unchanged.

The patterns established for each of the areas on the background economic variables are generally replicated on the international trade variables. Thus in Africa and Asia, once again, the clearest differences between military and low income nonmilitary regime systems are found. In both cases the military regime systems are significantly less committed to international trade (at the .05 level for exports and the .10 level for imports), and African military regime systems have a significantly worse trade balance (at the .05 level), but on other variables there is little difference. Asian military regime systems are an exception, for they have a significantly better international liquidity position, but the other differences follow as expected. In Latin America, the differences between the two types of system are not as marked; indeed, in South America particularly there are no significant differences. The differences that do occur, however, are in the expected direction. In Central America, the differences again follow the general profile with the exception of the trade balance, which is significantly worse in nonmilitary regime systems (at the .05 level). In the Middle East and North Africa, international trade commitment and international liquidity are virtually identical for both types of system; however, the trade balance is worse, although not significantly, in the nonmilitary regime system and direct investment is significantly higher (at the .05 level).

Analyses of variance of the number of coups on the international trade variables yield no significant differences. Further, although there are some weak correlations between the number of coups and the six international trade variables, the correlations become negligible once GNP is controlled. Thus, multiple coups cannot be associated with a weaker commitment to international trade, nor do multiple coups adversely affect the various components of a country's balance of payments. Regime duration, however, is of greater importance. While analyses of variance do not yield any significant results, there are three correlations of interest. Significant negative correlations between regime duration and export and import levels are slightly reduced when GNP is controlled but still remain significant. A positive correlation between duration and international liquidity becomes significant when GNP is controlled, suggesting that longer duration military regime systems do seem to be characterized by lower export and import levels. On the other hand, duration does not have

any pronounced effect on the balance of payments, and longer duration systems do have better international liquidity positions.

Economic Performance

Examination of the two categories of background economic and international trade variables demonstrates that although no extensive differences between military and low income nonmilitary systems are found, what differences do exist place the military regime systems in the weaker position. The economic analysis is completed by examining performance along three summary rates of growth.

The overall comparison between the two types of system indicates that the cost of living increase is significantly higher in military regime systems, but the rates of growth of GNP and exports are very close. The difference in the cost of living increase is significant only at the .10 level, and since GNP is measured in constant terms, not too much importance can be attached to this finding. When the high income systems are removed the basic similarity between the two types of system remains although the difference in the cost of living growth rate is no longer significant. Thus, military regime systems are marginally poorer in terms of background factors and weaker in some areas of international trade, but they perform generally as well as nonmilitary systems.

Given the positive correlation between GNP and the rate of growth of GNP and the fact that military regime systems have a higher rate of growth of GNP, better performance by them would have been expected. However, partial correlations, controlling for GNP, do not reveal any significant relationships thus eliminating the possibility of better performance by military regime systems.

When the two types of regime are categorized by GNP levels, only two significant differences appear within these levels. These are both in the high GNP category and indicate that military regime systems at this level have higher rates of growth both of GNP and of exports (significant at the .10 level). The number of cases of military regime systems is too small, however, to permit any firm inferences, but the results do not support the conventional view that as GNP increases it is the systems having poorer rates of economic performance that are likely to be characterized by military regimes.

For four of the five areas, tabulations dealing with both the background economic and international trade categories show that the relationship between the two types of system follow the pattern

of the general comparison. Differences among areas do appear, however, in terms of the degree of difference between the two types of system. The area tabulations of economic performance indicators differ somewhat from this general picture.[25]

African military regime systems have weaker background and international trade positions and do not perform as well as the equivalent nonmilitary regime systems. Asian military regime systems have weaker background and international trade positions, but perform as well as the low-income nonmilitary regime systems. Latin American military regime systems are marginally weaker on background factors, have similar international trade positions, but perform slightly better than the nonmilitary systems. Both types of system in the Middle East and North Africa are generally similar across all three categories of economic variables.

It might have been expected that systems characterized by multiple coups or by long-term military regimes would have the lowest performance rates. Generally, this is not the case, but regime duration rather than the number of coups has some slight relationship with the performance variables.

Analyses of variance of number of coups with the three performance indicators yield no significant results. In addition, all of the correlations between the number of coups and the performance variables give negligible values even when GNP is controlled. It must be concluded, therefore, that there are no important differences in economic performance between the types of regime regardless of the number of coups.

[25] The performance rates of the African military regime systems are consistently lower than their nonmilitary counterparts with the rate of growth of GNP being lower at the .10 level. The Asian military regime systems, which had a similar profile to the African military regime systems in the two previous categories, have poorer performance rates on cost of living and exports than the low income nonmilitary regime systems but a better rate of growth of GNP, but the differences are not significant. The military regime systems of Latin America have significantly higher export growth rates (at the .01 level) and lower cost of living increases (significant at the .05 level for Central America). The military regime systems of the Middle East and North Africa have better performance rates than the nonmilitary counterparts, but the differences are not significant.

Table 18. Economic Performance by Number of Coups

Type of System	Economic Performance: Rate of Growth of Constant per capita GNP	Rate of Growth of Cost of Living Index	Rate of Growth of Exports
NMRS (900–)	2.71	5.74	9.20
MRS (one coup)	4.01	13.19	10.61
MRS (two coups)	2.35	8.72	3.91
MRS (three or more coups)	1.70	4.60	8.33

Table 19. Economic Performance by Duration[a]

Type of System	Economic Performance: Rate of Growth of Constant per capita GNP	Rate of Growth of Cost of Living Index	Rate of Growth of Exports*
NMRS (900–)	2.71	5.74	9.20
MRS (0–2 yrs.)	5.30	3.92	13.50
MRS (2–5 yrs.)	2.49	6.04	11.33
MRS (5+ yrs.)	3.29	21.66	2.73

[a] Tests are analysis of variance for each variable.
* Significant at .05 level.

Analyses of variance of duration with the performance indicators provide one significant result related to the rate of growth of exports. Here the deviant case is the long-duration military regime systems, which have a very low rate of growth of exports.[26]

It will be recalled from the previous section that low levels of exports and imports were found to be related to long-duration military regime systems. The general relationship between export rates of growth and duration, however, must be interpreted with caution. The partial correlation between export rate of growth and regime duration, controlling for GNP, is insignificant, and multiple regression analysis does not show regime duration to be a significant estimator of the rate of growth of exports.[27] Total correlations and partial correlations, controlling for GNP, between regime duration and rates of growth of GNP and cost of living also yield negligible values. Thus, there is some evidence to relate long-term military regime systems to low export rate of growth, but the main conclusion must be that the two types of system do not differ from one another generally, even when considering the duration of the military regimes.

Conclusion

The primary concern of this article has been to examine, first, in what respects and to what degree

[26] Difference of means tests show that the military regime systems of 5+ years differs from low income nonmilitary regime systems, military regime systems (0–2 years), and military regime systems (2–5 years) at the .05, .10, and .01 levels respectively.

[27] The regression is significant at the .01 level and explains 34 per cent of variance of the rate of growth of exports. The independent variables are the number of coups, duration, GNP, rate of growth of GNP, exports, international liquidity, and GDFCF.

military and nonmilitary regime systems differ and, second, to deduce from such differences what the occurrence of a military regime may tell us about the question of instability.

It is clear from the cluster analysis that across a wide range of political, military, and economic variables, military regime systems are not universally different from nonmilitary regime systems. There is, however, some clustering of military regime systems. This picture has been clarified by comparing the two types of system across five categories of variables and by employing a number of controls for each of these comparisons. The consequence of these comparisons is to demonstrate that, as expected, the two types of system are clearly different from one another in what might be termed a political dimension and, to a lesser degree, they differ in terms of their international trading position, but they cannot be differentiated from one another by military, background economic, or economic performance criteria. Thus, systems which have experienced military regimes are not restricted to the weaker economic systems of the world once the small group of high income systems are removed. Their economic performance rates compare favorably with nonmilitary regime systems and, despite military rule, they do not, in general, have larger armed forces or greater military expenditure. While military regime systems do not have as firm a commitment to international trade, they are most clearly distinct from nonmilitary regime systems only in their lower levels of political activity and higher levels of political change.

Although classification by GNP levels indicate substantial variations within both types of system, any aggregate differences between the two types of system are generally constant across GNP levels. The same findings hold for the area controls that were utilized, but to a lesser degree. The main exception is the Middle East and North Africa, where very few differences exist between the two types of system. While each of the remaining areas generally follow the aggregate profile, area variations do occur largely in terms of the *degree* of difference between military regime systems and nonmilitary regime systems. Differences between the two types of system are most pronounced in Africa and Asia and much less pronounced in Latin America. Duration of the military regime and the number of coups explain little variance of the military, background economic, and economic performance variables. Thus, in these dimensions, military regime systems do not differ from nonmilitary regime systems regardless of the length of the military regime or of the number of coups that may have occurred. These variables, however, do have important influences on the political, and, to a lesser extent, on the international trade variables. Regime duration is the more powerful indicator of the levels of political activity, as might be expected. On the other hand, the number of coups is indicative of more rapid political change.

Some observations concerning the connection between military regime systems and the general notion of instability may also be made by relating differences between the two types of system to some of the control variables. If instability is defined strictly in terms of levels of political activity and political change, then military regime systems are certainly less stable than nonmilitary regime systems. If, however, instability is defined in economic terms, so that economic weakness indicates instability, then military regime systems are no less stable than nonmilitary regime systems. Thus, if the occurrence of a military regime is used as an indicator of political instability in the sense of indicating lower levels of political activity and higher levels of political change, it must be emphasized that political instability does not explain the internal or external economic situation; nor does it tell us anything about the size and the expenditure of the armed forces. The absence of a connection between the political and economic variables is particularly important. If a relationship between political instability and economic performance had been established, then the question of the impact of the economic dimension upon the political dimension and *vice versa* would have been raised. In many instances, the two types of system are not dissimilar in terms of the political variables as many low income nonmilitary regime systems restrict political activity. Further, military regime systems do not constitute a homogeneous population; considerable variation is found among them. Some military regime systems have had just one coup; others have had several. Some have had long lasting military regimes; others have had regimes of very short duration. Some perform well economically, others display economic weakness. It is important to know both the regime duration and the number of coups before any statement concerning political instability can be made. A whole range of factors must be known to cope with economic weakness. Military regime systems which experience longer term military regimes are considerably more restrictive in the political activity dimension while those with a higher number of coups are less stable with regard to the question of political change. Simply postulating, therefore, political or economic instability on the basis of the incidence of a military regime is clearly inadequate and possibly misleading.

APPENDIX

List of Variables

1. Number of coups
2. Percentage of years constitution not fulfilled
3. Number of executives

4. Percentage of years the legislature is banned
5. Percentage of years political parties are banned
6. Mean percentage of the Cabinet made up of military personnel
7. Navy and Air Force as a percentage of the total military size
8. Mean size of military
9. Expenditure on the military
10. Rate of growth of military size
11. Rate of growth of expenditure on the military
12. *Per capita* Gross National Product
13. Rate of growth of GNP
14. Rate of growth of exports
15. Rate of growth of cost of living index
16. Budget as a percentage of GNP
17. Exports as a percentage of GNP
18. Imports as a percentage of GNP
19. International liquidity as a percentage of imports
20. Gross domestic fixed capital formation as a percentage of GNP
21. Primary production as a percentage of Gross Domestic Product
22. Trade Balance
23. Direct Investment

Science and Rule in Bacon's Utopia: An Introduction to the Reading of the *New Atlantis**

J. WEINBERGER

Michigan State University

Modern utopian thought springs from the promise of modern science. It is the political expression of the claim of science to relieve man's estate and to enlarge the bounds of human empire.[1] The modern utopianism of modern science is nowhere more succinctly presented than in the claim Hobbes made for his novel political science. When founded on the principles of the new science with its "clear and exact method," the study of morals and politics would disclose a "true and certain rule of action by which we might know whether that which we undertake be just or unjust."[2] For Hobbes, the final victory of science over nature depended on the conquest of the problem of human nature, which Hobbes thought to be the problem of political rule. The aim of the new science of politics was to abolish the grounds of political controversy and thus to dissolve the problematic character of political discourse and life. The question of rule was reduced to the simple recognition of positive law; the new political science would guarantee that the precepts of natural law would be contained in the conventional precepts of civil law.[3]

The claim of the new science obscured the distinction between theoretical and practical speech, for the perfection of speech about man and nature was to facilitate the perfection of practical life. As determined by Hobbes's application of scientific method to politics, modern scientific discourse about politics is inherently utopian. The development of modern utopianism is not simply the development of a particular mode of political thinking, but is, rather, "a perfect paradigm of the course of modernity." Thus unlike Plato's *Republic* and More's *Utopia*, modern utopia has "ceased to be ironical and has become oppositional."[4] Whereas premodern utopia articulated human perfection by reflecting on the inherent delimitation of human nature, modern utopia illuminates present human defect from the standpoint of a future achievable human perfection. In modernity the literal meaning of utopia has been reversed; it no longer points to no place but, rather, lights the path to every place.

Bacon's *New Atlantis* is anomalous when seen in the light of the course of modernity. For the *New Atlantis* depicts a society formed by the rule of science, but it presents no explicit teaching about natural right or political rule. We wonder, then, why the political utopianism of modern science was not simply coeval with the origins of modern science. Though Hobbes was the first to proclaim the birth of political science, he was neither the first pioneer of science nor the first to proclaim modern teachings about morality and politics.[5] According to Rawley, it was Bacon's intention to include an account of the best regime in the *New Atlantis*, but the labor required and the enticement of natural history diverted his attention.[6] If Rawley is correct, the *New Atlantis* is incomplete simply because it lacks a political teaching. We might conclude, then, that the novelty of Hobbes's political science consists simply in his being the first to apply the new science of nature to

* The preparation of this study was aided by a Fellowship Research Grant from the Earhart Foundation. I would like to thank the Trustees of Earhart Foundation for their gracious and generous financial assistance.

The utopian legacy of the new science can be seen in both the realist or positivist and the idealist interpretations of the new science. Thus Kant argues that the pure notion of duty (*der Begriff der Pflicht in seiner ganzen Reinigkeit*) is simple and clear to a child of eight or nine even in complex situations. "Über den Gemeinspruch: Das mag in der Theorie richtig sein, taught aber nicht für die Praxis," *Kleinere Schriften zur Geschichtsphilosophie Ethik und Politik* (Hamburg: Felix Meiner, 1964), p. 82. the human things.[7] If Rawley is not correct, Bacon's motives were more complex, and the *New Atlantis* would present the promise of science in conjunction with a circumspect prudence toward any teaching about political rule. The *New Atlantis* would then be *both* oppositional and ironical, and for Bacon the relationship between science and political rule would be problematic. It might then be the case that the post-Baconian link between modern science and a certain, demonstrable political science sprang from the necessity to modify Bacon's teaching about science for the sake of moral and political perfection. The question of the *New Atlantis* is the question of its completeness, and the question of its completeness points to the roots of modernity. To study the *New Atlantis* is to study the coherence of the utopian promise of modern science.

The *New Atlantis* and the Coherence of Bacon's Corpus

Bacon's *New Atlantis* appears to be a strange choice of texts for an inquiry into the utopian character of modern scientific discourse about politics. It could be argued that since Bacon's works antedate Hobbes's political science, it is no wonder that the *New Atlantis* is not a serious reflection about politics at all. According to the traditional account, the *New Atlantis* is incomplete because it does not contain a teaching about government or political rule. This traditional account still obtains: most scholars accept the *New Atlantis* as a part of the plan of the *Great Instauration* because they take it to be a primitive description of a scientific academy and because it does *not* contain a thematic account of government.[8] This must mean that there is no commonly accepted "most important" political treatise by Bacon because he wrote no political treatise. Particular advice about particular problems offered to particular men may be interesting, but especially in Bacon's case, they do not seem to constitute a coherent and comprehensive account of man's political nature. Bacon's political writings consist of several of the *Essays: Of Nobility, Of Seditions and Troubles, Of Empire, Of Counsel, Of the True Greatness of Kingdoms and Estates, Of Faction;* the fragment *Of The True Greatness of Britain*, and fragments, letters and speeches touching holy war, British domestic policy, and policy toward Spain. These writings treat some matters of political negotiation and policy and focus mainly on the enlarging of British political influence in the world. But they do not make up a treatise on the fundamental considerations of political philosophy: the nature of the best regime, the ends of political life, and the nature and relations between the virtues of justice, moderation, wisdom and courage.

The lack of a political teaching in Bacon's works reflects a serious disunity in Bacon's teaching as a whole. Common knowledge justly reveres Bacon for his role in the birth of modern natural science. But if Bacon's importance is as a founder of modern science, his teaching can be but an interesting historical relic, for modern science doubtless has far surpassed its crude genesis with respect to method and content. The modern reader of Bacon's writings on natural history must find them to be quaint, and so only decent charity prevents them from being considered ridiculous. If the modern reader turns to Bacon's writings about method, he will find that they are incomplete and encumbered by metaphysical concerns now considered to have no place in the progress of scientific discovery. Indeed, these metaphysical concerns were so damaging as to blind Bacon to the crucial importance of mathematics for the interpretation and conquest of nature. If the modern reader is interested in the historical relics of modernity at all, he will be better served by turning his attention to Descartes and the origins of mathematical physics than to Bacon, who failed to recognize the importance of Copernicus and Galileo.[9]

If Bacon's writings are useless to one concerned with the method and content of modern science, the importance of his teaching about science must be his recommendation of practically useful science as the horizon for man's self-improvement. But surely this recommendation is a self-evident commonplace. The importance of this recommendation is again merely historical; its importance is visible from a contrast to its historical context that was unenlightened and darkened by the obscurities of prescientific thinking. Thus Bacon's importance is as a pioneer. But in the light of the urgent task of penetrating and conquering nature—Bacon's own view of the human project—pioneers deserve reverence but not serious reflection. Reverence does not necessarily deflect our time and energy from the scientific project; serious reflection most certainly does. It seems that on the basis of Bacon's only serious teaching, serious reflection on that teaching must be less than serious.

We are faced with a disconcerting alternative. Either Bacon's works are not important, or they are imperative for the serious student because the scientific project is problematic. Of course, by itself the latter possibility does not justify a reading of Bacon. Rather, we can profitably turn to Bacon if the scientific project is or may be problematic

[7] Cf. Mansfield, p. 98.

[8] See F. H. Anderson, *The Philosophy of Francis Bacon* (Chicago: The University of Chicago Press, 1948), pp. 24, 36, 40, 295; Francis Bacon, *New Atlantis*, ed. Alfred B. Gough (Oxford: Clarendon Press, 1915), pp. xxvii–xxix.

[9] See Paolo Rossi, *Francis Bacon* (London: Routledge & Kegan Paul, 1968), pp. 138–39, 223; Bacon, *New Atlantis*, ed. Gough, pp. xvi–xvii; cf. Anderson, pp. 292–303.

and if Bacon's teaching illuminates *how* it may be problematic. This means that Bacon's teaching about science is important only if it is a part of a comprehensive teaching about science, human ends, and human perfection. But Bacon's writings do not appear to provide such a comprehensive teaching. Bacon's most famous writings about man's morals and manners are the *Essays* and the *New Atlantis*. But while the *Essays* treat manners, morals, and, in a cursory way, politics, they do not treat these subjects in relation to the project of a new science. The *New Atlantis* is incomplete, and, according to the traditional account, it is incomplete because it lacks a teaching about the "best state or mould of a commonwealth." The *New Atlantis* is incomplete because it fails to combine an account of the organization of the project of science with an account of the political rule necessary for the best form of human life.

A unified and comprehensive account of man and science appears to be lacking even in those works that treat the virtue of science thematically. In the *Advancement of Learning*, Bacon argues that piety requires the dignity of natural philosophy to be separated from the proscribed articulation of human ends and perfection.[10] In concert with this piety, Bacon only hints at the virtue of knowledge as man's conquest of nature and argues that knowledge is useful for various human virtues without questioning the nature or status of those virtues as virtues. When Bacon discusses the human good, he makes several dogmatic assertions of the superiority of the "communicative good" over the "private and particular good" and the "active good" over the "passive good."[11] But in these very brief assertions, Bacon gives no systematic description of the nature or content of the human good and the human virtues, and, what is more important, he makes no mention of the human good and the human virtues in connection with the virtue of knowledge in general or natural science in particular.

In the *Wisdom of the Ancients*, *Masculine Birth of Time*, *Thoughts and Conclusions*, and the *Great Instauration*, Bacon declares the end of knowledge to be the human mastery of nature by means of practical natural science, but in none of these works is the nature of man as conqueror explicitly articulated. It seems that Bacon's works provide no complete and comprehensive account of science and human perfection. If modern utopianism is the political expression of the claim of science to determine the horizon of human possibilities, Bacon's writings hardly seem to be such an expression. Not only does the *New Atlantis* seem to lack a political teaching, but Bacon's works as a whole appear to provide no unified basis from which we might infer such a teaching.

But the preceding argument may be much too hasty. If we are to search for the meeting of Bacon's teachings about science and man, we must proceed by taking our bearings from Bacon's own words, and there is a Baconian work that presents an explicit organization of his scientific project. Bacon's sole organizational work must be the start of any attempt to penetrate the comprehensive, unified whole of his teaching.

The *Great Instauration* announces Bacon's plan for the complete reformation of human science and knowledge, which will "lay the foundation, not of any sect or doctrine, but of human power and utility" in order to "command nature in action." Bacon's intention was to insure the harmony of theory and practice, of the "intellectual and terrestrial globes," which will guarantee man's power over nature.[12] Elsewhere Bacon argues that the noblest end of science is the preservation and restoration of the corruptible things.[13] The *Great Instauration* is Bacon's public announcement of the whole of his project, and the conventional demands of piety prevent explicit identification of the commanding of nature with the conquest of nature's corruptibility. But since Bacon does hold the end of science to be the conquest of nature's corruptibility, and since the fullest commanding of nature must include overcoming natural decay, it is this highest conquest that in fact governs the plan of the *Great Instauration*.

A first glance at the *Great Instauration*, however, disappoints our hope of discovering a unified and comprehensive consideration of science and human perfection. For the most obtrusive characteristic of Bacon's great instauration is its incompleteness, an incompleteness acknowledged by Bacon himself. Part one is to be a division of the sciences, but it is declared to be wanting, although "some account of them will be found in the second Book of the 'Proficience and Advancement of Learning.' "[14] Part two is to present the new inductive method or the "art itself of interpreting nature" and is provided in the *Novum Organum*, but only as "a summary digested into aphorisms."[15] Part three is to be a foundational natural history, or the actual "first food" or factual

[10] *Advancement*, BW III, 265.

[12] *Great Instauration*, hereafter *GI*, BW IV, Proem., 8, 21, 23–24; *Novum Organum* I, 3, 83, II, 1–4; *Advancement*, BW III, 294–95.

[13] *De Sapientia Veterum*, XI, BW VI, 646,720. Natural philosophy thus "proposes to itself as its noblest work of all, nothing less than the restitution and renovation of things corruptible, and (what is the same thing in a lower degree) the conservation of bodies in the state in which they are, and the retardation of dissolution and putrefaction."

[14] BW IV, 35.

[15] *Ibid.*

material on which the new method will work. Although this part of the instauration is the most filled out,[16] it is incomplete according to Bacon's description of its particulars in the *Great Instauration*.[17] Part four is to "set forth examples of inquiry and invention" according to his method and is missing except for a very small fragment.[18] Part five is to present Bacon's own provisional discoveries not "according to the true rules and methods of interpretation, but by the ordinary use of the understanding in inquiring and discovering." Like part four, part five is missing except for a very small fragment.[19] Part six is to disclose and set forth the "developed and established" new philosophy that will be the "real business and fortune of the human race, and all power of operation."[20] But as a formally identified part of the plan, part six is missing altogether.

In view of the incompleteness of the project outlined in the *Great Instauration*, a unified and comprehensive consideration of the crucial questions of science and man seems to be lacking. This lack is all the more important since Bacon's discussion of scientific method is admittedly incomplete and but a "summary digestion." This confirms our earlier observation that it would be less than profitable to return to Bacon for any serious consideration of scientific method as we know it today. Again we find that the important theme is the way of the new science in the light of human ends and perfection. It is all the more dismaying, then, that there is no completed part of the plan that would present a thematic account of the virtue of the new science as a part of a comprehensive teaching about human ends and perfection. Although the *Great Instauration* projects such an account as part six, Bacon thwarts our search by failing to identify even a part or hint of its completion. At best the *Great Instauration* repeats and directs us to the dogmatic and incomplete remarks about the human and scientific virtues in the *Advancement of Learning*. It would appear that Bacon tells us nothing important about scientific method and tells us nothing about the crucial problem of the virtue or value of science itself. Small wonder it is that, in the absence of a substantial consideration of the latter problem, most scholars approach Bacon with an interest in the teaching about method. Small wonder it is also, then, that these scholars are hard pressed to demonstrate the importance of Bacon as anything other than a quaint relic of an age which was but the infancy of scientific enlightenment.

But perhaps the massive incompleteness of the great instauration as outlined in the work of that name is more apparent than real, and so perhaps the crucial question of the value of science constitutes a completed part of the plan. The plan of the *Great Instauration* presents a general picture of the end and method of the new science, rather than the step by step proceeding of the new science to its end. This cannot be otherwise, for parts three, five and six must be incomplete simply because of Bacon's personal mortality.[21] Since part four is "in fact nothing more than an application of the second part in detail and at large,"[22] the first and second parts, which are provided, present the thematic core of the plan, for the coherence and intelligibility of the plan does *not* depend on its being complete or immediately completable. Bacon makes this point in a subtle way when he explains the incompletability of part six. Bacon says that part six would "disclose and set forth that philosophy by which the legitimate, chaste, and severe course of inquiry which I have explained and provided is at length developed and established."[23] In the light of Bacon's remarks in the preface and in the descriptions of parts three and five, it goes without saying that part six must be beyond hope of completion for Bacon. Bacon's personal mortality prevents his giving a full account of the completely developed penetration, understanding, and conquest of nature. But Bacon does *not* say that the picture of the end of science, the condition where "human knowledge and power do really meet in one," is inconceivable. Rather, he says that the fortune of the human race, which will give issue to Bacon's beginning, cannot *easily* be conceived or imagined.[24] This means, of course, that with difficulty man's fortune can be conceived or imagined. The human possibilities illuminated by the new science of nature can be articulated before the step-by-step way of the new science is fully presented or completed. By the implication of his own words, Bacon's claim that part six is simply incompletable is less than strictly true.

Since part six can be completed before the perfection of method and before the specific content of the new science is completed, then if it exists, it must be a description of human life liberated or being liberated in the way that the new science promises to liberate. If part six exists, it must be a description of human life liberated "to some degree" from the "necessities and miseries of humanity,"[25] and that degree will be measured by the preservation of the corruptible things. We must look to Bacon's corpus to see if such a de-

scription exists, and the writing that is the obvious candidate is the *New Atlantis*. The *New Atlantis* presents the picture of a society of men dedicated to the pursuit of science and so to the end governing the pursuit of science. Other than the description of the scientific institution, the longest description of the society visited by the sailors is the description of the festival celebrating the procreation and preservation of the human body, surely the most important of the corruptible things.

However much the preceding argument may be true, it does not alter the obvious fact that the *New Atlantis* is incomplete. The work that would treat the virtue of science in the light of human ends and perfection is incomplete, and so all we have discovered is that the incompleteness of the *New Atlantis* reflects the crucial disunity of Bacon's teaching as a whole. But lest we give up the chase in disgust, we must be reminded of Bacon's remark in the description of part six. The imagining and conceiving of man's scientific fortune is possible but difficult. The pressing task must be to explore the way of this difficulty and the reason for it.

The *New Atlantis* and the Whole of Bacon's Teaching

Next to the title, obvious incompleteness is the most obtrusive characteristic of the *New Atlantis*. But what is omitted because of the formal incompleteness? According to the traditional account, the *New Atlantis* is incomplete because it does not contain a teaching about government or political rule. We noted that the traditional account still obtains, but if we have been correct so far, the very worth of Bacon's teaching depends on the falsity of this account. Since a comprehensive account of the human good must include an account of government, the question of the traditional view of the incompleteness of the *New Atlantis* becomes the most important question guiding any approach to Bacon's teaching.

A first glance at the *New Atlantis* both supports and subverts the traditional account. On the one hand, the *New Atlantis* is not simply silent about government. We learn that Bensalem is a monarchy, and much of the *New Atlantis* is an account of the origin of Bensalemite law and a description of its customs. On the other hand, this apparently sketchy information would hardly seem to be a comprehensive account of the best form of commonwealth. If we are to discern how the *New Atlantis* is a comprehensive description of human perfection facilitated by science, we must discern how the sketchy political information could possibly be a whole or complete part of a complete teaching about the true, scientific human good. A reconsideration of the place of the *New Atlantis* in the plan of Bacon's great instauration provides the necessary clue for this discernment.

If we are correct to view the *New Atlantis* as the image or pattern of human life where knowledge and power do really meet in one, then it must be the end that governs the articulation of parts one and two of the *Great Instauration*. The need for the new method and the announcement of the sufficient and deficient sciences is governed by human possibilities that determine the fortune of the human race, for it is this fortune that will give issue to Bacon's account of beginnings.[26] There must be a harmony between the content of the *New Atlantis* and the content of parts one and two of the *Great Instauration*. If there is a particular way in which these parts are incomplete, it must be reflected in the incompleteness of the *New Atlantis*. Thus if there is a particular way in which the *Novum Organum* and the division of the sciences are incomplete, it will provide a positive determination of just how the *New Atlantis* is incomplete. But if we find such a positive determination, is it not the discovery of fool's gold? Would not such a positive determination simply confirm the worthlessness of Bacon's work? We must hope that the positive determination of incompleteness provides the determination of the completeness of Bacon's teaching.

The positive determination of incompleteness is not to be found in the incompleteness of the *Novum Organum*, which presents the new inductive method in but a "summary" form "digested into aphorisms." In the light of Bacon's remarks about his personal mortality and hopes for the completion of his project, it is clear that the account of method need not be fully articulated in order for the plan of his instauration to be complete as an outline of proper directions and ends. This does not apply to the division of the sciences, however, because the particularization of the deficient and sufficient sciences is determined by the human possibilities that constitute man's fortune. The exact determination of the means to the perfection of these sciences, the actual fulfillment of their content, can and must wait for the labor of others. The positive determination of the incompleteness of the *New Atlantis* depends on the determination of the incompleteness of the division of the sciences.

In the *Great Instauration*, Bacon openly informs the reader that the division of the sciences is incomplete. The heading of the first part of the *Great Instauration* declares that the first part is "wanting," although "some account of them will be found in the Second Book of the 'Proficience and Advancement of Learning, Divine and Human.' "[27] But in the dedication of *An Advertisement Touching An Holy War*, Bacon asserts that the expanded, Latin version of his "book of Advancement of Learning" will "serve in lieu of the first part of the Instauration and acquit [his]

[26] *GI*, BW IV, 32.
[27] BW IV, 35.

promise in that part."[28] This contradiction is important for two reasons. First, the translation and expansion of the *Advancement of Learning*, the *De Augmentis*, does not significantly change the determination of the sciences judged to be lacking or insufficient.[29] Second, it is very curious that Bacon did not announce the completeness of part one in the *De Augmentis* itself. Rather, he chose to make this important announcement in a fragment that is apparently unrelated to the division of the sciences. Bacon was certainly aware of the importance of the announcement; although he did not include it in the *De Augmentis*, he instructed Rawley to translate and publish the *Advertisement* even though it was to remain as an incomplete fragment.[30] Bacon's strange indirectness can be understood only by understanding how the claim of the *Great Instauration* and the claim of the *Advertisement* can be consistent. That is, Bacon's strange indirectness can be understood only by discerning how the division of the sciences, and so also the *New Atlantis*, can be both complete and incomplete. It appears that we have begun to find our clue: however we find the division of the sciences to be incomplete, we must be prepared to discover that that incompleteness is a positive part of a whole or complete teaching about man's scientific fortune.

Bacon provides an explicit standard of completeness for part one in his description of that part in the *Great Instauration*. He says that in the division of the sciences it is his intention "not merely to set down a simple title or a concise argument of that which is wanting," but "(provided it be a matter of any worth) to take care to subjoin either directions for the execution of such a work, or else a portion of the work itself executed by myself as a sample of the whole: thus giving assistance in every case by work or by counsel."[31] In the *Novum Organum*, Bacon asserts that his new method is "certainly meant" to apply to natural philosophy, logic, ethics, and politics.[32] Of these important sciences, only politics is listed merely by mention of "simple title" in the *Advancement of Learning*. In the division of the sciences in the *Advancement of Learning*, the study of government is the third part of civil knowledge, the first two parts of which are knowledge of conversation and knowledge of negotiation. Knowledge of conversation is declared to be not deficient and is, therefore, not discussed. However, the two parts of knowledge of negotiation or business, wisdom of counsel and wisdom of pressing a man's own fortune, are explicated in great detail. At one point Bacon provides so many examples that he apologizes for dwelling longer than is "agreeable to the proportion of an example."[33] Thus in the contexts both of the division in general and of civil knowledge in particular, the mention or division of the science of government stands out by its conspicuous violation of Bacon's announced standard of completeness.

The reason for Bacon's silence is not because the science of politics is complete or sufficient, for we know that the new method must be applied to it. Rather, Bacon states explicitly that the study of government or political science is a subject "secret and retired." The reason for this secrecy is that political science is either too hard or not fit to utter.[34] It is easy to see why that which is not fit to be uttered must be unuttered, for to speak what must not be spoken is to cause damage or alarm. But why should the difficult be unuttered? There can be but one reason: if the speaking of the difficult is forbidden, it is because as spoken it will cause damage or alarm. The argument from difficulty is assimilated to the argument from unfitness since both are problematic because of possible damage or alarm.

In the *De Augmentis*, the secrecy of political science is demonstrated with even greater emphasis.[35] In the *De Augmentis*, Bacon underscores the secrecy of political science by distinguishing between those parts of civil knowledge which do not belong to the secrets of empire. Just as in the *Advancement of Learning*, political science is the third of three parts of civil knowledge. The first, knowledge of conversation, is sufficient. The second, knowledge of negotiation, is deficient and so many examples of such a doctrine are given. Unlike the *Advancement of Learning*, however, the *De Augmentis* emphasizes the secrecy of the third part, political science, by distinguishing between those parts of political science which are deficient and which can be treated, for which he gives examples "according to his custom," and those parts of political science which cannot be mentioned and so which cannot be divided. The reason Bacon gives for his silence is deference to King James who is "such a master"

[28] *Advertisement Touching An Holy War*, BW VII, 13–14.

[29] The *De Augmentis* expands, truncates, and rearranges parts of the *Advancement of Learning*. In the *De Augmentis* Bacon adds as a deficient science the noblest part of medicine, the prolongation of life, omits as a deficient "science" the laws to suppress the arts of sensual pleasure, and mentions the defective consideration of the relationship between the rational and irrational parts of the soul. BW IV, 391–97; cf. *Advancement*, BW III, 377–79. These changes strengthen the present case.

[30] The *Advertisement Touching An Holy War* was written while the *De Augmentis* was in the hands of translators. Spedding also wonders why the *De Augmentis* was not entitled "Division of the Sciences: Part One of the Great Instauration," BW I, 415–420; cf. BW VII, 3–7.

[31] *GI*, BW IV, 23.

[32] *Novum Organum* I, 127, BW IV, 112.

[33] *Advancement*, BW III, 452; the discussion of Civil Knowledge covers BW III, 445–477.

[35] *De Augmentis*, BW V, 31–110.

in the art of government and to whom the *De Augmentis* and the *Advancement of Learning* were dedicated. But certainly in comparison to the *Advancement of Learning*, Bacon's stance toward the King in the *De Augmentis* is less than deferential. Brevity is not the same as silence, and even so, Bacon is not brief in his examples of the mentionable parts of political science. Again, with greater emphasis laced with audacity, Bacon argues that the reason for his silence is the secret nature of political science.

Bacon's clues disclose how the division of the sciences is incomplete. The division of the sciences articulates the "intellectual globe" that must become harmonious with the "terrestrial globe" for the issue of man's true fortune.[36] But although the new harmony between the intellectual and terrestrial globes must include a teaching about government or politics, any comprehensive pattern or plan of these globes, i.e., man's scientific fortune, must be outwardly incomplete because of the unmentionableness of dangerous political science. Since the *New Atlantis* is the image or pattern of man's scientific fortune, the division of the sciences and the *New Atlantis* stand together in a relationship of mutual dependence. Although the *New Atlantis* must be of highest importance as the outline of the human possibilities governing the particularization of the deficient sciences, the division of the sciences must be articulated and followed if true human fortune is to be given issue. Thus the image or pattern illuminated by the *New Atlantis* must be congruous with the principles of the division, and for this reason we must conclude that the *New Atlantis* is incomplete because of the unmentionableness of dangerous political science.

Bacon's clues disclose how the division of the sciences and the *New Atlantis* are incomplete, but they also insist that the division of the sciences is complete, that the duty of part one has been "acquitted," and so they insist that the *New Atlantis* is complete. This means that both the division of the sciences and the *New Atlantis* must contain a teaching about government, but that it must be presented in an informal and indirect way that conforms to the retiredness and secrecy of political science. The *New Atlantis* is incomplete because it presents an image or pattern of scientific perfection that lacks a formal, direct, and open account of political science. The *New Atlantis* is complete because it presents an image or pattern of scientific perfection that includes an informal, indirect, and secret teaching about government that is dangerous and problematic. Our attempt to reach the core of Bacon's teaching directs us to his teaching about human perfection based on man's rule over nature. But before we can investigate that human utility, we are silently taught that in spite of man's rule over nature and the conquest of nature's corruptibility, the rule of men over men is problematic.

Bacon's articulate silence was governed by an extraordinarily circumspect prudence. This prudence is disclosed by reexamining the way we have come. In the *De Augmentis*, Bacon remarks that if his "leisure time shall hereafter produce anything concerning political knowledge, the work will perchance be either abortive or posthumous." In the meantime he presents those parts of civil knowledge "which do not belong to the secrets of empire" so that all the sciences being "ranged as it were in their proper seats," the seat of political science will not be left vacant.[37] In this description Bacon is unclear as to whether the alternative "abortive or posthumous" is meant to be inclusive or exclusive. On the one hand, it would seem that Bacon's description is inclusive, that is, that the political teaching will be either abortive or posthumous and possibly both. For the *New Atlantis* is both abortive and posthumous.[38] On the other hand, it would seem that Bacon's description is exclusive, for the division of the sciences, which must mirror the *New Atlantis*, is abortive but nonposthumous. Thus the description of his political teaching is both inclusive and exclusive. Although the *New Atlantis* must mirror the division of the sciences, and vice versa, the *New Atlantis* is the head of Bacon's teaching about man's scientific fortune because it presents an image or pattern of human life as it is lived according to the perfection of natural science. According to our way of discovery, guided by Bacon himself, the combination of the abortive and nonposthumous with the abortive and posthumous illuminates the complete and the posthumous. The combination of the division of the sciences with the *New Atlantis* makes available Bacon's complete teaching by means of the clue given in a political work, *An Advertisement Touching An Holy War*. The latter work is the key, but the door that it opens was presented only after Bacon's death. Bacon's extraordinary prudence underscores the serious importance of its cause: the completeness provided by Bacon's silent or secret political teaching is the completeness of Bacon's most important teaching—the teaching about the human ends and perfection that illuminate the new science of nature and that are facilitated by the new science.

We are now prepared to see how the sketchy political information in the *New Atlantis* completes a whole part of a comprehensive teaching

[36] *GI*, BW IV, 22–23, 32; *Novum Organum* I, 3, 84, II, 1–4, BW IV, 47, 81–82, 119–122; *Advancement*, BW III, 294–95.

[37] *De Augmentis*, BW V, 79.

[38] Although written in its final form in 1624, the *New Atlantis* was published by Rawley in 1627, after Bacon's death.

about the true, scientific human good. The danger of political science is the danger of Bacon's comprehensive teaching about science and man. The serious reader of Bacon must be open to the possibility that Bacon's political teaching is the core of his teaching about the human possibilities freed by the new science of nature. Since the noblest end of the new science is the preservation and resurrection of the human body, the most important of the corruptible things, the limit of that preservation and resurrection may consist in the relations between human bodies rather than in the nature of any or all particular human bodies. But if political science and so the full understanding of the possible relations between human bodies is so dangerous as to require Bacon's circumspect prudence, the serious reader of Bacon must be open to the possibility that the human possibilities freed by the new science are morally problematic in their very perfection. The ground on which Bacon's teaching about science and man comes together is his political science, and we know now why this ground must be elusive. But this elusiveness is ultimately important because of the coexistence of Bacon's explicit optimism and zeal for the conquests of science and the prudent, articulate silence of his central political teaching. Whatever the moral problems and dangers of the new science may be, Bacon intends for mankind to embrace them as a part of man's necessary fortune. Bacon intends for mankind as a whole to embrace a fortune that can be seen in its entirety only by those men who are the most courageous and resolute.

If the combined completeness and incompleteness of the *New Atlantis* issue in a dangerous teaching about government, just how is the *New Atlantis* complete and incomplete, and what does the *New Atlantis* reveal about the dangerous political problem of man's scientific fortune? The title and final line declaring formal incompleteness are the most obtrusive parts of the *New Atlantis*. "New Atlantis" is not an obvious title. "Bensalem," "Renfusa," or "Salomon's House" would all be more plausible titles, for Atlantis is mentioned only as the country defeated by the ancient Bensalemites and destroyed by natural catastrophe.[39] The title calls our attention to another important account of the ancient Atlantis in a way that suggests the reformation or perfection of the ancient Atlantis. The other account, to which Bacon explicitly refers, is that of Plato. Since Bacon's title is less than obvious, the connection between the ancient Atlantis and Bensalem is obscure. But the less than obvious title openly directs our attention to Plato's account in the *Timaeus* and *Critias*, and so to the ends of the old and new stories. For like Bacon's story, the *Critias* is incomplete. Plato's dialogue breaks off just as Zeus, angered by the prideful insolence of Atlantis, prepares to announce his intended chastisement of Atlantis to the assembly of the gods. Thus we are uninformed of Zeus' punishing that was to moderate and harmonize the Atlantians.[40] That Bacon repeats the incompleteness of the *Critias* appears strange in the light of the title. Since the title suggests the reformation or perfection of the ancient Atlantis, one would expect the opposite of what in the *Critias* insures the imperfection or defectiveness of Atlantis. One would expect the *New Atlantis* to be finished so as to illuminate the true perfection of Atlantis.

In comparison to the *Critias*, however, the *New Atlantis* is a finished story. Whereas the speech of Zeus that would describe the defect and future perfection of Atlantis is omitted, the speech of the Father of Salomon's House that describes the "true state of Salomon's House," the "noblest foundation" ever upon the earth and the "lanthorn" of Bensalem, is provided to reveal the perfection of the new Atlantis for "the good of other nations."[41] So although the story is declared to be incomplete, it is not transparently clear in what the incompleteness of the *New Atlantis* consists, how the title is related to the final line, and how the new Atlantis is related to the old. As directed by Bacon's circumspect prudence, we know that to penetrate the *New Atlantis* is to penetrate the unity or completeness of Bacon's comprehensive teaching about science and man, and we know that the core of that teaching may be a teaching about political science. We can determine the latter possibility only by working through the *New Atlantis* to see if the directions and content of a political teaching can be found. But whatever the directions and content may be, we can pursue them only by careful attention to Bacon's prudent and circumspect way. In the *New Atlantis*, Bacon teaches by what he does not say as guided by what he does say, and by the careful combination of his articulate silence with an indirect but available structure of allusions.

Arrival in Bensalem

The story narrated in the *New Atlantis* consists of two overlapping major themes. The first major theme depicts the changing character of the sailors who visit Bensalem and who ultimately become the announcers of Bensalem's virtues. This first theme is itself twofold: its first section tells of the plight of the sailors, who are at the mercy of nature's necessity and chance and who consider themselves to be unfree; the second section tells of the sailors' experiences after they come to regard

[39] *New Atlantis*, hereafter, *NA*, BW III, 141–44.

[40] δίκην αὐτοῖς ἐπιθεῖναι βουληθείς, ἵνα γένοιντο ἐμμελέστεροι σωφρονισθέντες *Critias* 120d6–121c4; cf. 106a–b8. See *Timaeus* 22a, 25a–25b6; *Phaedrus* 278d7; *Laws* 676ff.

[41] *NA*, BW III, 145, 156, 166.

themselves as free men.[42] The second major theme of the story depicts the revelation of Bensalem to the sailors. It is composed of four sections. The first section portrays the way the sailors are received by the Bensalemites; the second section presents a history of Bensalem that explains its Christianity and laws of secrecy; the third section describes the current practices that extol and control Bensalemite erotic behavior; and the fourth section presents a description of the House of Salomon by the Father.[43] The two major themes overlap and intersect. The cut between the two sections of the first major theme is also the cut between the second and third sections of the second major theme. This shared cut is the sailors' declaration of their liberation. Taken together, the two major themes combine to form a third major theme that springs from the story as a whole. This third theme presents the revelation of Bensalem to the rest of the world, and since the intersection of the first two constituent themes is the sailors' declaration of their liberation, we must wonder whether and why liberation is necessary for their becoming the announcers of Bensalem.

Although the liberation of the sailors and the revelation to them of Bensalem come together to form the universal revelation of Bensalem, the two revelations are not identical. The difference between them consists precisely in the degree or fullness of revelation. Although the sailors, through the narrator, tell all that they know, the Bensalemites do not tell all that *they* know.[44] The sailors are not told all there is to know of Bensalem's laws of secrecy, and this must seem strange in the light of the central deed of the story. This deed is the unveiling of Bensalem and its exposure to the rest of the world, which eliminates the need for the laws of secrecy. The universal revelation that subverts the reason for secrecy is itself limited by secrecy. Thus, only a careful study of the story will provide a complete revelation that unveils the secrecy inherent in the revelation of Bensalem to the sailors and the world. Only a comprehensive understanding of this secrecy illuminates the true nature of the sailors' liberation and the liberation of their worldwide audience.

The sailors are speakers of Spanish and English and are, therefore, representatives of the early European masters of exploration. The narrator begins by relating how the men became subject to the vicissitudes of wind and sea, which they take to be the product of God's providence.[45] Their predicament is not their fault, for they have taken care to make "good spare of their victuals." In response to God's inhospitable providence, the men display lax or superficial piety and pray only when their bodies are in danger. No mention of prayer is made in describing their departure; we are not told if a priest is on board, and the men pray only for survival, not for the forgiveness of sin. The prayer, beseeching God, who "showeth His wonders in the deep," makes obvious reference to Psalms 107:23–32, where God rains great storms to terrify men in ships only to redeem them and bring them to their "desired haven." A close look reveals that Bacon reverses the Psalmist's story. Though strong winds afflict the sailors, it is these same strong winds, not calm, that bring them to a haven that is at first not desired. While the men of the psalm do nothing to help themselves, and "reel and stagger" and come to their "wits' end," Bacon's sailors do all in their power to save themselves, turning to prayer only as a last resort. Although the sailors refer to God as creator, His creating is mentioned in the context of scarcity of victual and hostility of sea. Comparison of Bacon's "psalm" to that of the psalmist underscores the superficial piety of the sailors and suggests a contrast between their own prudent responsibility and the irresponsibility of divine providence. At this point in the narrative, the sailors are ignorant of the House of Salomon and hence are ignorant of the possible Bensalemite control of wind and sea.[46] Bacon's change in the psalm, then, suggests the possibility that the providence displayed in the *New Atlantis* replaces the providence of an irresponsible and hostile creator. Thus in the beginning, the sailors' ignorance of Bensalemite science causes them to seek final refuge in the bonds of heavenly grace; this ignorance and their gradual enlightenment provide the background for their liberation.

In contrast to what has become of Plato's Atlantis,[47] Bensalem is an island naturally open to ships, although access to the port and city is strictly controlled by law. The Bensalemites are "humane" but prudent: the "man of place" or high rank claims to worry only about disease but stays "a flightshot" away. The accounts of the first encounters and of the sailors' going ashore are characterized by unusual procedures and events.[48] The sailors learn gradually that tips are scorned in Bensalem as double payment. The Bensalemites are very concerned with the precise limitation of rewards and with the prevention of "extras" or petty bribes. A second kind of tip, the sailors' promise of God's "reward" to the Bensalemite officer, while not scorned, is met with silence—a

strange reaction for a Christian man. The oath required of the sailors illuminates this strange reaction. Before the sailors are allowed to come ashore, they must swear "by the merits" of Jesus that they are not pirates and have not shed blood "lawfully or unlawfully" within forty days. The conditions of the oath refer merely to the tainting of recent bloodshed and make no distinction between lawful and unlawful killing. With respect to righteousness, this is a contradiction of the Old Law, which makes a distinction between lawful and unlawful killing.[49] Taken together, the oath and the "psalm" hint that Bensalemite law provides a grace superior to that of Christ, that Bensalemite law surpasses both the Old and New Laws, but in a way that would count recent killing worse than old murder. Bensalem acknowledges the human lust for blood, and its law permits an oath that obscures the difference between killing and murder.

The men go ashore and are confined for three days while their sick are cured by the marvelous medicine of Bensalem. During their confinement the narrator addresses the sailors, likening their situation to that of Jonah and suggesting that they behave with restraint because their hospitable confinement may be a pretext for careful scrutiny by the Bensalemites. The differences between the sailors' plight and that of Jonah are obvious. Jonah fled from divine command, while the sailors travel for exploration or money or both. God sent a tempest to buffet Jonah, while strong winds of suspicious origin firmly guide the sailors to their destiny. Jonah subjected himself to bodily harm, while the sailors appear solely concerned to avoid bodily harm. Jonah brought tidings of destruction and learned a lesson in pity, while the sailors bring no such tidings but do learn something of pity.[50] While Jonah obeys divine command, the sailors obey only Bensalemite command. It is in this context that the sailors first mention the well-being of the soul, although the reason for their concern is explicitly utilitarian, and weal of body is mentioned in the same breath with weal of the soul. Thus, comparison of Bacon's Jonah with the biblical Jonah again suggests that Bensalem offers a grace that surpasses the power of divine grace to save or preserve body and soul. Like Jonah, the sailors learn something about pity, but, since the grounds of that pity may be a new kind of grace, we must wonder whether in Bensalem a new kind of pity will replace divine pity.

[49] Exodus 20:13; 21:12–14; Numbers 35:9–34; Deut. 5:17. The Bible requires the exile of the manslayer because of the avenger's desire for revenge. See Maimonides, *Guide of the Perplexed* III, 40, 41. With respect to the sailors, the oath must be necessary only because of the danger of the killer's bloodlust.

[50] *NA*, BW III, 154.

The sequel to the narrator's speech illuminates the unseemliness that lies beneath the outward hospitality of Bensalemite ways. The narrator's suspicions are confirmed.[51] With the next visit of a Bensalemite official we learn that the sailors still fear for their lives but that this fear is dampened by the speech and offer of the official. The sailors are informed that they may be told some things they will not be unwilling to hear. Providing they do not go beyond one "Karan" from the city walls without special leave, the state will allow them to stay for six weeks or more, and if they have any request, they must not fear to ask it of the Bensalemites because their countenances will not be "made to fall." All this is possible because the Strangers' House is rich; it has been thirty-seven years since any strangers have visited.

The official's remark that the sailors may be told some things that will be happily heard indicates other things that would be unhappily heard. This points to the possible grounds of Bensalemite inhospitality and the narrator's earlier concern. The offer to stay comes after the three days of confinement. Since the Bensalemites study ways to control wind and sea, there may be another reason for the wealthiness of the Strangers' House. The Strangers' House could be rich simply because the Bensalemites have chosen not to spend their wealth on men they have previously brought to the island. The governor of course speaks only of a lack of visitors, but the power of Bensalemite science to draw "visitors" to its shores and the necessary laws of secrecy illuminate the harsh reality feared by the narrator.[52] For when the governor-priest later explicates King Solamona's laws of secrecy, he remarks that no strangers have been detained against their will and that the sailors must think that anything reported by returning strangers would be "taken where they came but for a dream."[53] In the sequel, however, it is said that the missions of the Fellows of Salomon's House (the scientific institution) are strictly governed by the laws of secrecy.[54] This of course reflects the reason for the laws of secrecy: protection from corruption or attack by foreigners who might change or despoil the island.[55] Surely, then, the laws of secrecy assume the credulousness of non-Bensalemite peoples. The final revelation of the House of Salomon, meant as it is "for the good of other nations," also presupposes such credulousness.[56] The conclusion that must be drawn is obvious. Until the visit of the sailors, no strangers left Bensalem, and those who were unwilling to stay must have been imprisoned or killed.

[51] *Ibid.*, pp. 135–36.

[52] See below, n. 97.

[53] *NA*, BW III, 145.

[54] *Ibid.*, p. 146.

[55] *Ibid.*, p. 144.

[56] *Ibid.*, p. 166.

The Bensalemites are outwardly moderate, humane, and Christian, but a close examination of their oath and their laws suggests the subversion of divine law and the extreme opposite of hospitality. In this light, the seemingly commonplace and polite offer that gilds the Bensalemites' ambiguous hospitality must be viewed with circumspection. The offer is an open offer; the official says that *any* request will be met. Bacon modestly fails to mention the most notorious need of disembarking sailors, but we may now wonder if the offer goes beyond the healthy lust of seamen. The offer can be fully understood only in the light of Joabin's later mention of "Lot's Offer,"[57] but at this point we know that although all things may not be told, all things may be requested. If the Bensalemites' policy toward unwanted visitors may require murder unrestrained by divine or civil law, we may wonder whether for some wanted visitors, no request by such visitors will be too base.

The first part of the *New Atlantis* shows that the Bensalemite hospitality offered to the unliberated sailors suggests a combination of restraint and excess. The sailors are capable of great restraint: for the sake of their bodies and souls they restrain their use of victuals, restrain their "vices and unworthiness," and accept the travel limitation in spite of the inflammation of their hearts. Yet even this restraint is not at first as extensive as Bensalemite restraint, for they only gradually conform to the Bensalemite scorn of tips. But Bensalemite restraint, like Bensalemite Christiantity and humanity, is beclouded by the harshness and baseness suggested by ambiguous hospitality. This hospitality hints at the coherence of moral opposites but not in a formally open way, and the secrecy of the *New Atlantis* illuminates the obscure grounds of the explicit secrecy of Bensalem. Bacon directs our attention to the possibility that the imperatives governing the choice and reception of visitors as the announcers of science necessitate the opposites of Bensalem's outward hospitality and restraint. The propagation of Bensalemite perfection is not immune from the possible problem of immoral means for moral ends. The important question is whether this problem is the sole root of Bensalem's secrecy. If it is, the *New Atlantis* must appear to be incomplete because of a problem that is overcome with the perfection of science. If it is not, the *New Atlantis* must appear to be incomplete because of a problem at the heart of man's scientific fortune.

Bensalem's Past: The Histories

Since the sailors are ignorant of Bensalem while the Bensalemites know about the sailors, the sailors are permitted to ask questions about Bensalem and its people. The questions prompt the governor-priest to relate the religious and institutional histories of Bensalem, which illuminate the nature of Bensalemite secrecy and the nature of the sailors' liberation.[58]

The first question asks about the nature of Bensalem's conversion to Christianity. The answer relates an instance of the miracle of revelation but is actually a subversion of divine revelation. For the implication of the wise man's prayer is that scientific speech must be the vehicle for divine miracles. Miracles must be "acknowledged" and "testified" for people by a man with the requisite scientific knowledge. Without this acknowledgment it would be impossible to discern true miracles from art, natural phenomena, fraud, or illusion. In the Bible, however, discursive speech is distinguished from miracles or signs; the miracles of God are meant to circumvent the need for speech. There is, therefore, no biblical distinction between true and false miracles but only between true and false speech, between true and false prophecy. Bacon, however, assimilates the veracity of prophecy to the veracity of miracles, and the result of this assimilation is the debunking of both. In the *Advancement of Learning*, Bacon implies that there can be no standard for verifying miracles as distinct from natural oddities because both are by nature rare. Thus there can be no certain distinction between true miracles and tales or impostures.[59] Insofar as Bensalem holds the wise man of Salomon's House to be the necessary judge of miracles, it invokes a natural scientific standard that is necessary and yet inapplicable. The Bensalemite test for veracious miracles debunks the status of miracles altogether. Bacon includes in this debunking not just the miraculous transmission of previously revealed divine speech, but also an original miracle of divine revelation. Without trustworthy divine revelation, the shepherding of Christ or divine providence is impossible.[60] Bensalem's saving and liberation of the sailors has nothing to do with God's claim to save and to liberate.

It is in the context of the debunking history of revelation that the names of the *New Atlantis* are revealed. The island is called "Bensalem," and the city on the eastern coast is called "Renfusa." Bensalem is a word of obvious Hebrew origin and is fashioned from the words "ben" and "šalem." The compound would be rendered "son or offspring of completeness, safety and peace." Bensalem, then, is the offspring of completeness as the product of science and scientific rule; Bensalem is

[57] *NA*, BW III, 153. See below, p. 881, n. 89.

[58] *NA*, BW III, 136–147.

[59] *Advancement*, BW III, 287–88. See below, nn. 65–67.

[60] Not only does the Bible fail to mention judges of miracles from Bensalem's House of Salomon, but the biblical King Solomon's natural history is lost and is not a part of the canon. *Advancement*, BW III, 298–99; I Kings 4:33.

the product of the completion or perfection of human knowledge and so represents the harmony of the possible intellectual and terrestrial globes. In spite of the formal incompleteness of the story, the name of the island explicitly suggests completeness and perfection. Bensalem is a complete and perfected model of the end of Bacon's great instauration. The island's name is revealed just before the veracity and hence the worth of divine revelation is debunked. Bensalem's perfection is independent of divine shepherding or providence.[61] All the more important, then, is the name of the city, which is probably the port visited by the sailors.[62] "Renfusa" is a combination of the Greek words *ρήν* and *φύσις*, which would be rendered "sheeplike" or "sheep-natured." Since sheep are in need of a shepherd, it is clear that the shepherd of the Bensalemites is not the debunked shepherd of divine revelation, but, rather, the independent perfection of science and scientific rule. The ambiguous relation of the shepherd to his flock is, therefore, not to be overlooked. If the history of Bensalem replaces the history of providence, it must be asked how and to what degree the Bensalemites are, in fact, sheep. The answer to this query more fully illuminates the saving and liberation of the sailors.

The speech about Bensalem's history repeats the replacement of divine providence by Bensalemite rule and reveals a problem inherent in that rule; it illuminates the relation between sheep and shepherd. The history follows the account of Bensalem's Christianization and provides a partial answer to the sailors' query about Bensalem's secrecy. The first part explains why the rest of the world has no intercourse with Bensalem, and the second part explains why the Bensalemites remain hidden from the world in spite of Bensalem's intercourse with the rest of the world.[63] The civil history of Bensalem is the history of the coming of scientific rule. It must be noted at the outset that a history of Bensalem is a history of the perfection of science and as such is the perfection of human history. Thus Bacon's remarks about civil history in the division of the sciences are of great importance for understanding the civil history of Bensalem.[64]

In the *Advancement of Learning*, Bacon likens the three kinds of civil history to three kinds of pictures or images: unfinished, perfect, and defaced.[65] Thus there are three kinds of civil history: memorials, perfect histories, and antiquities. Perfect histories are either of times, lives, or actions. The history of times, which is the most complete kind of civil history, is distributed by God's providence and is divided into the antiquities of the world, the history of Greece and Rome, and modern history. Although the history of times and divine providence are linked, Bacon makes no mention of the history of God's works—the Bible—in his discussion of the history of times. Rather, he treats the two parts of the Bible, the history of prophecy and the history of providence, as parts of a separate discussion of ecclesiastical history.[66] But in the first part of the *Advancement of Learning*, Bacon argues that ecclesiastical history often errs because miracles are too often given easy credit by "the people" only later to be esteemed old wives' tales or impostures. But at this crucial point in the *Advancement of Learning*, Bacon gives no hint as to what the criteria for judging the veracity of miracles may be. Rather, he contrasts his silence on this point to the mention of the standard of veracity in natural history: rareness and seeming incredibility. The standard of natural history only emphasizes his silence, for this standard cannot be used to discriminate between miracles because miracles are by definition rare and seemingly incredible.[67] The unstated implication must be that there are no criteria for judging the veracity of miracles and that proper acceptance of miracles is simply indistinguishable from ignorance, superstitious simplicity, and politic toleration. In this respect, the *New Atlantis* is in perfect accord with the teaching of the division of the sciences.

Since the veracity of the Bible depends on the miracle of revelation, and since the demonstrable veracity of miracles is debunked, the Bible can prudently be taken only as a human document with human limitations. Since it is neither the history of Greece and Rome nor modern history, and since it purports to divide times and declare the end of days, the Bible can at best be the remaining kind of the civil history of times: it can at best be the antiquity of God's providence. But since antiquities are "defaced" and "subject to the shipwrecks of time," the Scriptures must be defective history rather than perfect history. With circumspect prudence, Bacon argues that the history of God's providence is simply a defective and incomplete part of civil history. If there is an end of days, it can be declared only by a completed, per-

[61] The vehicle of Bensalemite perfection, the natural science of the House of Salomon, comes to Bensalem before the saving grace of Jesus. See below, p. 878.

[62] The sailors are brought to Bensalem by a "wind from the south, with a point east." *NA*, BW III, 129. Thus the wind came from the south-east and would have caused them to land on the eastern shore of the island. Renfusa is a city on the eastern shore of the island.

[63] *NA*, BW III, 139–143, 143–47.

[64] *Advancement*, BW III, 333–37.

[65] *Ibid.*

[66] *Ibid.*, pp. 340–42. In the *De Augmentis* Bacon treats ecclesiastical history as a part of civil history. *De Augmentis*, BW IV, 243–44. Again, this minor change strengthens the present argument.

[67] *Advancement*, BW III, 287–88. Of course, this *is* the standard used in Bensalem.

fect, universal history of times that is *not* the history of God's works.

Bacon argues that a perfected or completed history of times *is* possible in a proper history of Great Britain, which is "after the manner of the sacred history" because both relate the uniting of separated kingdoms.[68] Bacon implies that completed or perfected modern history will replace the sacred history in dividing times and declaring the end of days. Modern history in the form of a proper history of Great Britain will distribute the history of times and proclaim the end of days, which means that the proper history of Great Britain will declare completed or perfected human nature.

In his mention of the sacred history, Bacon refers only to the "story of the Ten Tribes and of the Two Tribes as twins together."In the context that points to the inherent limitation of sacred history, Bacon limits the sacred history to the period from the Exodus to the united Davidic monarchy. He makes no mention of the second empire or monarchy, the empire of Jesus Christ. It is, then, not immediately clear how perfectible modern history replaces the history of divine providence. While modern or perfected history replaces the claim of Christ to save, it is not clear whether the modern replacement of providence takes account of the difference between David and Jesus. From the standpoint of pious Christianity, which characterizes the outward appearance of Bensalemite society, this distinction is of paramount importance. The difference between the old and new covenants consists in the saving grace of Jesus whose divine and human perfection contrasts with the defects of the first of the House of David. Bacon's silence with respect to this crucial difference is striking. It suggests that the difference is of no importance and points to the possibility that perfected modern history, which proclaims perfected human nature, preserves the fundamental characteristic of Davidic-Solomonic hegemony. As any schoolboy knows, the rule of David and his successors was characterized by the sexual excesses and sins of David and the prophecy of Nathan. Thus if perfected modern history preserves the fundamental characteristic of Davidic hegemony, the human perfection it announces will be characterized by Davidic excess. Bacon's discussion of perfected civil history tells us what to note in his example of perfected civil history; if the example excludes the distinction between David and Jesus, we must wonder about the nature of scientific human perfection or completeness.

Bacon argues that the perfection of science will be coeval with the "circling of the earth, as the heavenly bodies do."[69] That is, the perfection of science will be coeval with the circumnavigation of the terrestrial globe. Bensalem, of course, represents the possibility of such circumnavigation, and the sailors have been shown to represent the European masters of exploration, the Spanish and the English. The narrator writes in English, and we wonder if this does not reflect Spanish subservience to English exploration. Thus the sailing of the men to Bensalem represents the future way of Great Britain to the perfection of science and hence to the fulfillment and perfection of human destiny. The history of Britain's future is, therefore, the history of Bensalem, which ends in the true end of days. It declares the perfection of man, which, as perfect, distributes the history of times and ends the history of times. Thus the history of Bensalem and the history of England converge.[70] It is all the more important, therefore, to note whether the history of Bensalem as perfected history, or the culmination of man's scientific fortune, admits the crucial distinction between David and Jesus.

The history related by the governor-priest tells the stories of Altabin's triumph over the insolent Atlantians, the institution by king Solamona of Salomon's House, and the institution of the Bensalemite laws of secrecy. As we should expect, the civil history of Bensalem contains the history of the coming of science. From the clues provided by the governor-priest, the chronology of Bensalemite history can be reconstructed, as well as the date of the sailors' voyage.[71] If the "six score years" since navigation has begun to increase be reckoned from the obvious beginning of European navigation, 1492, the sailor's voyage takes place in 1612.[72] The time referred to as "three thousand years ago" would, then, be 1388 B.C., 458 years before the biblical Solomon completed the temple in 930 B.C., and the date of king Solamona's reign, which brought Salomon's House, would be 288 B.C. The first mention of Bensalem's past is before the acme of Davidic greatness, and the event

[68] *Advancement*, BW III, 336.

[69] *Ibid.*, p. 340.

[70] It is of course unimportant whether England or another country was to be the bearer of modern history. Bacon's choice is properly patriotic, but the important points are that only modern history is said to be perfectible, and that Bensalem is the model of life governed by modern science, which is the principle of human perfection.

[71] See Howard B. White, *Peace Among the Willows: The Political Philosophy of Francis Bacon* (The Hague: Martinus Nijhoff, 1968), pp. 104 n. 30, 121–22.

[72] This date puts the voyage after the publication of the *Advancement of Learning* and before the *Novum Organum* and *De Augmentis*, and it provides a clue to the primacy of the *Advancement of Learning* in the whole of Bacon's writings. The division of the sciences contained in the *Advancement of Learning* provides the description of the intellectual globe that will tame and conquer the terrestrial globe. Cf. White, pp. 104 n. 30, 121–22, 197–98.

heralding the completion of Bensalemite greatness —Solamona's institution of the scientific academy —is 642 years after the acme of Davidic greatness. Thus the history and perfection of Bensalem as the model for human perfection is chronologically within the era of David's sin and Nathan's prophecy. Bensalem's perfection predates the coming of Christ; in spite of the Bensalemite replacing of Christ's saving and Christ's kingdom, the replacement of Bensalemite (English) history for sacred history excludes the distinction between Jesus and David. Although we can identify pre-Davidic beginnings of Bensalem, we cannot find a post-Davidic past and so an event that would obviate the prophecy of Nathan. Thus Bacon's remarks about history and his example of perfected history come together; the distinction between Jesus and David is no part of the human perfection that replaces the promise of sacred history. Unless the advent of Solamona's reign explicitly obviates the prophecy of Nathan, we can expect the characteristics of Bensalem's Davidic past to be manifest in its post-Christian but "Davidic" present, which is England's and mankind's future. This important possibility can be finally accepted only after an examination of Bensalem's present and the speech of Joabin. It should be noted, however, in addition to the obvious implication of Joabin's name, that the unit of measure in Bensalem is the "Karan," a Hebrew word that can mean a ruler of the House of David and a horn.[73]

Bacon's account of Bensalem's early encounter with the Atlantians (Coyans) makes explicit reference to Plato's account of Atlantis and Athens in the *Timaeus* and *Critias*. Important differences and distortions separate the two accounts, however, and suggest a Baconian revision of Plato's teaching about nature's necessity, and excess and moderation. Plato teaches that the Athenians defeated the technically advanced but insolent, prideful, and tyrannous Atlantians, and that they magnanimously freed those who dwelled within the bounds of Heracles despite their failure to aid in their own liberation.[74] Bacon hides the magnanimity of the Athenians by declaring his uncertainty about the identity of the Greeks who, along with the Bensalemites, defeated the invading Atlantians. Rather, he contrasts the ruthlessness of the Athenians (or whoever it was), who destroyed every ship and man of the invading Atlantians (Tyrambelians), with the extraordinary humanity and clemency of Altabin, the king of the Bensalemites at the time.

In Plato's account, at a later time from the conflict, earthquakes and floods destroyed the entire body of Athenian warriors and caused the entire island of Atlantis to be swallowed by the sea. The deed no longer lives in Athenian memory because Athens, along with the rest of the world except for the Egyptians, was subject to "many and diverse destructions of mankind, of which the greatest are by fire and water, and lesser by countless other means."[75] In Plato's account, Egyptian antiquity depends upon the combination of memory and piety, for although they are immune from rain and fire because of the fortuitous presence of the Nile, they are not immune from earthquakes.[76] In Plato's account, then, both the moderate and the insolent were destroyed by nature's ravages; the distinction between them was preserved only in the mnemonic speech of the pious Egyptians. In Bacon's account, while Atlantis and the rest of the world are destroyed by "accidents of time," which consist of violent natural destruction or slow natural decay, the Bensalemites are saved from such destruction by the coming of science. Nature's power to destroy wholly is overcome; no one suffers the total annihilation of Plato's Atlantis. Thus, for Bacon, Bensalem combines the deeds of the Athenians (Greeks) and the surviving antiquity of Egypt. The difference between Egypt and Bensalem consists in the difference between piety and natural science. As might be guessed by now, this difference is, for Bacon, simply the difference between nature's chance and the scientific conquest of nature. He is careful to note that "that whole tract is little subject to earthquakes."[77]

For Plato, the distinction between moderate and immoderate deeds can be permanent only in speech, for with respect to the rewards of deeds as such, the moderate and the immoderate are ultimately linked by the indiscriminate chastisement of natural catastrophe and decay. But since Plato teaches that it is not speeches that are permanent and enduring, but rather the intelligible things or *ideas* disclosed by speeches, the enduringly moderate or moderate in itself is in fact twice removed from particular moderate or immoderate deeds.[78] For Plato, the search for the eternal *ideas* of the human virtues discloses the distinction between theory and practice. The articulation of the eternal *ideas* of the virtues explains the intelligibility of

[73] Ezekiel 29:21; Psalms 132:17. The verb form means to send out rays or display horns.

[77] *NA*, BW III, 142. Bacon refers to the natural disaster at once as "Divine Revenge" and as a "main accident of time." *NA*, BW III, 143. It is by no means clear that the destruction of Atlantis in Plato's account is due to divine revenge, for there is no thematic connection between the missing speech of Zeus and the destruction of Atlantis. See *Timaeus* 25c8–d7; *Critias* 121b7–c4: Benardete, p. 30; cf. *Timaeus* 21a7–el; *Phaedrus* 272c7–278d2.

[78] *Republic* 474c–480a.

particular deeds as moderate or immoderate, but discloses the indeterminateness of particular deeds as singularly moderate or immoderate. For Bacon, the scientific overcoming of the distinction between speeches and deeds, between theory and practice, consists in the overcoming or conquest of natural catastrophe and decay and results in the permanence of speeches and deeds. As shown by the contrast of Plato's Athens and Atlantis to Bacon's Atlantis and Bensalem, the scientific conquest of natural catastrophe and decay facilitates the permanent and certain distinction between moderate and immoderate deeds. But Bacon has distorted the Platonic account of Atlantis, and our first comparison of the two accounts must be revised. The revision discloses astonishing results.

According to Bacon's distortion, the Athenians were no less ruthless than the Atlantians; the barbarism of the Athenians is contrasted with the extraordinary humanity of Altabin. Yet the Bensalemite overcoming of natural castastrophe and decay as well as necessity and chance, the creation of the perfected combination of Athens and Egypt, is the work of Solamona rather than Altabin.[79] It is Solamona who brought science to Bensalem and is said to be its lawgiver; it was his intention to perfect the prescientific humanity of Altabin that was subject to natural decay. Yet Solamona's laws are laws of secrecy that contain the harsh reality of the most extreme inhospitality and inhumanity.[80] Thus the humanity and hospitality of Altabin contrast with the potential inhumanity and inhospitality of Solamona's reign and laws that complete the humanity of Altabin. The humanity perfected by scientific conquest is a problematic humanity. It is in this light that Bacon's distortion of Plato is intelligible. If the deeds preserved by the memory of Egypt reveal no distinction between the moderate and the immoderate, the replacement of Egypt by Bensalem makes eternal the link between the moderate and the immoderate.

But we must not contrast Bacon's version of Plato's Athens with his description of Altabin's Bensalem. In terms of moral virtue, Plato's Athens and Altabin's Bensalem considered together contrast with Bacon's distorted Athens and Solamona's Bensalem considered together. The proper comparison is between Plato's moderate Athens and the humane Altabin, on the one hand, and Bacon's immoderate Athens and Solamona's Bensalem, on the other hand. Bensalem is a new Atlantis; Bacon's distorted Athens and Bensalem are alike in their immoderation and different only in their different susceptibility to natural catastrophe and decay. Bacon's Bensalem perfects and immortalizes the immoderation of Bacon's distorted Athens, but this means that Bensalem immortalizes the insolent pride of the old Atlantis.

For Plato, the distinction between the moderate and the immoderate is indeterminate with respect to particular human deeds. But while the distinction between the moderate and the immoderate is problematic in deed, the distinction as such is intelligible and is disclosed by the link between ephemeral speeches and the eternal things. Thus while there is no divine speech about justice or moderation, there is human speech that pursues the divine and illuminates the eternal grounds of justice and moderation.[81] Although there can be no certain, demonstrable determination of particular moderate deeds, the theoretical pursuit of the moderate as such moderates the lure of those practical goods for the sake of which men commonly behave in moderate or immoderate ways. The common fate of Athens and Atlantis is not disheartening because human virtue is not determined by the strict superiority of one particular deed over another. Rather, the rough, indeterminate practical distinction between moderate and immoderate deeds, expressed by right opinion, is grounded on the distinction between theory and practice and the consequent superiority of the theoretical to the practical life.[82]

For Bacon, the scientific conquest of natural catastrophe and decay permits practical life to endure. But the subtle contrast Bacon presents between the old and the new Atlantis suggests that the immortalization of practical life makes eternal the link between moderate and immoderate deeds, and we must wonder if this does not subvert the ground of any possible moderation. For Bacon, like Plato, there is no divine speech about justice and moderation. But unlike Plato, Bacon gives an account of the new Atlantis that is incomplete because of the dangerous, unmentionable product of the new science that will perfect human practice by facilitating the preservation and restoration of the corruptible things. While these suppositions spring from an interpretation of

[79] The war and natural decay that afflicted the "rest of the world," as distinct from the "main accident of time," took place *after* the beginning of Solamona's rule and the institution of science. We know this because Solamona found an island where the entrance of strangers was frequent and for that reason ordained the prohibitions that "touch the entrance of strangers." *NA*, BW III, 144. Solamona came upon an island that was both "happy and flourishing," and his intention was "to give perpetuity to that which was in his time so happily established." Altabin's name means "twice lofty," and his double loftiness or perfection of humanity and war was incomplete without the third perfection, the perfection of science. Altabin's perfection was defective because of its susceptibility to natural decay and chance.

[80] See above, p. 874, Solamona's founding laws hide Bensalem's origins by indirectly dictating that recent killing be considered worse than old murder.

Bensalem's past, they are confirmed by the revelation of Bensalem's present, upon which the meaning of Bensalem's history and the whole of the *New Atlantis* depend.

Bensalem's Present: The Feast and Joabin's Speech

The cut between Bensalem's past and present corresponds to the cut between the two sections that illustrate the sailors' changes of heart and mind. It is at the juncture between Bensalem's past and present that the the sailors exhibit restraint that springs from desire rather than fear and declare their liberation. The historical speeches that proclaim the replacement of divine providence by Bensalem's promise and the laws of secrecy provide the background for the sailors' new-found freedom. Their freedom consists, therefore, in freedom from the limitations on bodily weal that they have known, and in corresponding freedom from the bonds of divine grace or providence.[83] The speeches about Bensalem's present illuminate the relation between Bensalem's past and present, which in turn reveals the true nature of the sailors' new restraint and freedom.

The revelation of Bensalem's present consists of two parts: the first is a description of the sum of Bensalem's promise, and the second describes the regulation of that promise. The feast of the Tirsan[84] (any father of thirty living descendants) is sponsored by the Bensalemite regime and honors the promise of the regime, the preservation and generation of the human body, which shows Bensalem to be "compounded of all goodness." Because of the Bensalemite priority of body over soul, the state of the soul is not the primary consideration in the feast of the Tirsan. Rather, it is "granted to any man that shall live to see thirty persons descended of his body alive together, and all above three years old." At the same time that the festival honors the ultimate priority of body over soul, it reveals the stringent moral restraints imposed by the Bensalemite regime. The regime guarantees, with the power of law, the orders of the Tirsan on the moral seemliness of his favored family. As we learn from Joabin, Bensalem is the "virgin of the world"[85] who sees as the sum of all goodness the preservation and generation of the human body. The feast honors the end of Bensalemite restraint and humanity: the preservation of the human body and the most intense pleasure that accompanies the procreation of human bodies. In the action of the story, the sailors, who restrain body and soul for the sake of the weal of their bodies, show themselves to be open to the promise of Bensalem. While the humane restraint of the Bensalemites appears to reflect the humanity and restraint of Altabin and Solamona, the sequel to the description of the feast reveals the restraint and humanity of Bensalem to be problematic. This problematic restraint and humanity is confirmed by reflection on the relation of the Bensalemite past to the Bensalemite present.

The speech of Joabin explicates the full meaning of the feast.[86] He is asked about marriage laws and customs because the relation of the feast to the narrator makes him wonder about "nuptial copulation" from which proceeds the "propagation of families." Joabin's remarks consist of a long speech about European and Bensalemite marriage and a short mention of the "Adam and Eve's pools."

Joabin first characterizes European and Bensalemite marriage practices. Whereas Bensalem is the most chaste of nations, "free from all pollution and foulness," and the "virgin of the world," European marriage practices are foul and debauched. In Europe, marriage is "ordained a remedy for unlawful concupiscence," but since Europeans have at hand "a remedy more agreeable to their corrupt will, marriage is almost expulsed." For "the depraved custom of change, and the delight in meretricious embracements (where sin is turned into an art) maketh marriage a dull thing and a kind of imposition or tax." The Europeans liken marriage to prostitution when they argue that prostitution, like marriage, should be tolerated because it prevents "greater evils; as advoutries, deflowering of virgins, unnatural lust, and the like." But Joabin says that the Bensalemites hold this argument to be a preposterous wisdom, and they call it "Lot's Offer; who to save his guests from abusing, offered his daughters. . . ."

After a brief interruption by the narrator, Joabin describes the laws that regulate Bensalemite nuptial copulation. There is no polygamy; there is a month wait between first interview and marriage or contract for marriage; marriage without parental consent is "mulcted in the inheritors," (i.e., the children are penalized); and finally, "because of the many hidden defects in men and women's bodies," before a contract is made, one friend of

[83] *NA*, BW III, 147. The sailors declare their liberation in the sixteenth paragraph of the story. The sixteenth Essay in the *Essays* treats atheism and is followed by the seventeenth Essay on superstition. The principle of the sixteenth Essay is that any belief about God is better than unbelief. The principle of the seventeenth Essay is that unbelief is better than wrong or heretical belief. Given that such a contradiction must aways redound to the benefit of unbelief or atheism, Bacon here makes an argument for atheism. In the seventeenth paragraph the narrator forgets a difference between six and seven days. If Essays sixteen and seventeen come together as a true essay on atheism, the number of Essays is equal to the number of paragraphs in the *New Atlantis*.

[84] *NA*, BW III, 147–151.

[85] *Ibid.*, p. 152.

[86] *Ibid.*, pp. 151–54.

the potential bride and one friend of the potential groom are permitted to see the bride and groom "severally bathe naked" in the Adam and Eve's pools that are situated near every town.

Joabin's speech is the most important in the *New Atlantis*. Joabin as speaker is of crucial importance: except for the wise man who judged the miracle, Joabin is the only post-Solamonic character described as wise. The Father of Salomon's House, who makes the final speech revealing the "true state" of Salomon's House is *not* described as wise. Not only is Joabin said to be wise, but he is also said to be "learned, . . . of great policy, and excellently seen in the laws and customs of Bensalem." Joabin is, therefore, wise in the study of government or rule, and as such he speaks of the Jewish dreams "from tradition" rather than from conviction of truth.[87] Joabin knows the Jewish dreams as dreams; as a man wise in general and wise in policy, he transcends the myths of Bensalem. It is as a man wise in general and wise in policy that Joabin exhibits the only comprehensive wisdom in the *New Atlantis*. In terms of explicit description, Joabin's wisdom surpasses even that of the large-hearted founder and lawgiver Solamona. It is all the more important, then, that Joabin's speech illuminates the fundamental problem of Bensalem's promise.

As Bacon has Joabin present it, the Bensalemite characterization of European marriage and prostitution as "Lot's Offer" is subtly inappropriate. Joabin argues that the European practice is to offer daughters (prostitutes or wives) to save other daughters, the potential victims of unnatural lust and rape. But Lot offered his virgin daughters to save male strangers, an act of extraordinary hospitality.[88] If Joabin's characterization is meant to contrast European and Bensalemite practices—and this is Bacon's intention since the context is an explicit contrast of Bensalem to Europe—Bacon has Joabin express Bensalemite abhorrence of the offering of daughters to save daughters, but has him indirectly approve the offering of daughters for the sake of visiting strangers. The example of "Lot's Offer" points to the Bensalemite offer to the sailors and to Bacon's modest but conspicuous silence regarding the sailors' sexual desires.[89] By means of subtle allusion and conspicuous silence, Bacon causes Joabin's speech to suggest the Bensalemite secrecy that hides the immoral means necessary for the propagation and rule of science. Just as restraint is necessary for the propagation and rule of science, so too are laws of secrecy that mask the unrestraint of "unlawful lust" necessary for the proper treatment of necessary strangers.

We are reminded of the harsh alternative to Bensalemite hospitality when the narrator says that Joabin's speech reminds him of his sin as Elias reminded the widow of Sarepta. Bacon causes the narrator to ignore the widow's fear that Elias had come to kill her son.[90] The laws of secrecy hide Bensalem from the world in more than the obvious way; they mask Bensalem's hospitality and humanity, which can include basely open offers and the inhumane opposite of hospitality. Joabin's speech, which reflects the present practice of the "son of completeness" or perfection, illuminates the immoral means that are necessary for the promise of Bensalem's perfection. The speech reveals the secrecy necessary to overcome the temporal gap between Bensalem as a completed model and the task illuminated by the sailors' odyssey, the way of science to the actual lived reality of the image or model of scientific perfection.

The institution of the Adam and Eve's pools[91] is an important part of Bensalem, which, as the offspring of completeness, is the model of scientific perfection. The institution of the Adam and Eve's pools regulates nuptial copulation by preventing the dissatisfaction with one's own partner made possible by the discovery of the "many hidden defects in men and women's bodies." The noblest end of science is the preservation of the human body. The pools regulate the act of generation and the most intense pleasure preserved by the conquest of bodily decay, they regulate the pleasure that informs the very end of science itself. Joabin's speech also exhibits a second crucial silence or secrecy; his remarks are interrupted at the point where obvious queries about this astonishing institution would naturally arise. Although we know that desire for bodies other than one's own mate's is a potential problem in Bensalem—this is the very reason for the institution of the pools—Bacon causes Joabin to make no mention of possible licentious desire provoked by that which is most conducive to the breakdown of restraint. Thus Bacon ignores the obvious possibility that a friend of a suitor might make a false report of bodily defect because he desired the intended partner for himself, for Bacon is silent about the sex and marital status of the friends. Thus, although Bacon acknowledges the desire for a more perfect or beautiful body and informs us that this

[87] *NA*, BW III, 151. The narrator does not simply ascribe the Jewish dreams to Joabin but, rather, says that "surely this man . . . would ever acknowledge" them. He is careful to point out that Joabin espouses Bensalemite Jewish belief by tradition; to recognize tradition is not necessarily to acknowledge truth.

[88] Genesis 19:1–11.

[89] See above, p. 875. One modest editor saw fit to omit the discussion of marriage and eros for the sake of "modern taste." *New Atlantis*, ed. Gough, p. vi.

[90] I Kings 17:18.

[91] *NA*, BW III, 154.

desire must be regulated, he describes Bensalem as having an institution that ignores the very erotic desire it is designed to regulate. By causing Joabin to be silent because of a crucial interruption, Bacon describes an institution designed to control Bensalem's erotic behavior that in fact reinforces the licentious possibilities of choosiness, the love of one's own, and the desire for more. Although the institution is meant to keep the rooster in the coop, it exacerbates the possibilities of adultery and cuckoldry.

Bacon's indirect description of Bensalem's erotic practice is important in the light of what must by now be obvious. The only man said to be wise in general and wise in policy, who articulates the astonishing Bensalemite erotic practice, is named *Joabin*. Not only was Joab David's strong lieutenant in his rise to power, but he is known as one of the most ruthless men in the Old Testament. It was Joab who committed murder, who slew David's son, and who carried out the treachery against Uriah the Hittite. It was Joab, then, who assisted in adultery and cuckoldry; he was David's horns in matters that deal with horns.[92] In the light of Bacon's indirect description it is again obvious that the institution and practice of the Adam and Eve's pools, revealed to us by Joabin, are imitations of the sin of David, which arose from the viewing of a friend's wife bathing.[93] In the speech of Joabin, Bacon teaches by means of a subtle structure of allusion and conspicuous silence. With Joabin's speech, Bacon confirms the web of indirect suggestions of a problematic Bensalemite humanity and perfection that leads up to the speech. The speech of Joabin links Bensalem's past and present so as to disclose the dangerous truth about the perfection of science and man's scientific fortune. We noted earlier that unless the coming of Solamona obviated the prophecy of Nathan, unless it eliminated the defect of excessive desire, the defective characteristics of Bensalem's Davidic past would be present in its Davidic present and, hence, in England's and mankind's scientific future. Both the speech and name of Joabin, far from signaling the obviation of Nathan's prophecy, point to the repetition of Davidic excess. Bacon identifies Joabin with Joab and so identifies the ruthless Joab and the problem of excessive desire with the man of comprehensive wisdom. But "Joabin" is simply the plural form of "Joab"; Joabin's name and speech are not only of Joabin, not only of a wise man, but of all other and future men of comprehensive wisdom.

If the Davidic characteristics of Bensalem's past are inherent in Bensalem's present and future, the possibility of insolent excess is inherent in the promise of science. The grounds of that excess, which knows only the limits of barbarism,[94] are the desires of one human body for another. One justly wonders, then, about the final disposition of unnecessary and undesired strangers. The contrast wrought by the institution of science in the history of Bensalem *is*, then, between the simple magnanimity and humanity of Athens and Altabin on the one hand, and the problematic magnanimity and humanity of the distorted Athens and Bensalem, or the new Atlantis, on the other hand. The speech of Joabin completes a picture that shows the true depth of Bensalem's problematic humanity to consist in the grotesque possibilities of excessive desire. Bacon's point is that since science requires restraint for most men, the full range of possibilities promised by science cannot be revealed in its entirety. Bensalem is not on the surface a nation of barbarous cannibals; on the contrary, the Bensalemites are sheep—"Tirsan" is a Persian word (tarsān) meaning timid or fearful—and they are shepherded by the rule of science. It is all the more important, therefore, to wonder in what or in whom the ultimate *rule* of science consists.

Joabin's speech explicates the secrecy which is a means of science to its end and which is abolished by the central deed of the story, the revelation of Bensalemite science to the world. But Joabin's speech also explicates the more profound secrecy which is inherent in the end and perfection of science and which is not abolished by the universal revelation of science. This latter secrecy necessitates Bacon's prudent, circumspect, and indirect way of teaching. It is only by following Bacon's way that we can see how the *New Atlantis* contains a teaching about political science, and so that we can see how the *New Atlantis* and the whole of Bacon's teaching are complete.

Conclusion

The last section of the story presents the magnificent return of a Father of Salomon's House, his revelation to the narrator of the "true state of Salomon's House," and the final deed of the story, the Father's giving of a "great largess" or tip to the narrator and his fellows.[95] The Father's speech about the "true state" of Salomon's House reveals that it is dedicated to the study of the things above, the things below, and the things in between, which constitute the visible whole.[96] The study of the things above, however, does not include the

[92] See n. 73 above.
[93] II Samuel 11:2–5.
[94] See *Advancement*, BW III, 290–95, 420–26; *De Sapientia Veterum*, XII, XIII, XVI, BW VI, 649–652, 654, 723–26, 728.
[95] *NA*, BW III, 154–166.
[96] *Ibid.*, p. 157.

study of the celestial heaven.[97] The visible whole, the conquest of which is the "enlarging of the bounds of Human Empire," is limited to the realm inhabitable by the human body. The celestial heaven is excluded from the visible whole studied by the new science because of man's limited ability to fly. In the light of the eternal promise of science, the celestial heaven can be no image of the delimitation of human nature; the celestial heaven is ignored because it contributes in no way to the eternal, intelligible whole that is illuminated and constituted by science and human power.

Perhaps a more important study omitted from the House of Salomon is the study of policy or government. The House of Salomon studies natural philosphy and logic, it studies all varieties of bodies that are useful for the preservation and perfection of human bodies, but it does not study the relations between human (ensouled) bodies. In accordance with the secret and retired nature of government, the regime of Bensalem is hidden from view. It is not completely hidden, however. We learn that Bensalem is a monarchy, and we see its laws and deeds that regulate secrecy and erotic affairs. While the men of Salomon's House decide matters of secrecy, they do so without the science that governs the practice of secrecy.[98] Their practice of secrecy points to someone learned in political science who would adjudicate their decisions. Thus, wherever the Bensalemite regime is located, it is clear that the wisdom that guides its rule does not spring from the House of Salomon. The Bensalemite regime must perpetuate secrecy, even toward the fellows and Fathers of Salomon's House, because of the problem of human eros. It must be wondered whether the Father himself is not a servant of the one who truly rules because the true ruler alone understands the full range of human possibilities illuminated by the new science. Bacon's mention of the Father's pity[99] would, then, be doubly ironic. At the same time that its ambiguity reflects the scorn and compassion the Father feels for his sheep, it reflects the sheepishness of the Father himself.

Consideration of the possible source of wise Bensalemite rule obviously leads to a consideration of Joabin's comprehensive wisdom. If the true rule of science springs from a comprehensive understanding of science and man, then Joabin's comprehensive wisdom must be the source of the true rule of science. But Joabin's comprehensive wisdom also illuminates the fundamental and enduring problems of scientific rule. Joabin's wisdom, which reflects the harmony of speech and deed and the full range of human possibilities engendered by that harmony, illustrates the problem inherent in the very end or perfection of science itself.

The teaching about scientific rule is located in Joabin's wisdom, but that very teaching necessitates the outward incompleteness of the story. The completeness of the *New Atlantis* consists in a teaching about scientific rule that must appear to be missing. Bacon argues that the conquests of science will facilitate the subduing and overcoming "to some degree" of the "necessities and miseries" of humanity, and it is only in Joabin's political wisdom that the limit of this overcoming is to be found. The limit of the overcoming of necessity and misery does not consist in the delimitation of the human body as such; for the new science, the corruptibility of man's body is simply the jealous act of a conquerable God. Rather, the limits of the overcoming of human necessity and misery, as disclosed by Joabin's wisdom and Bensalemite rule, consist in the problematic relationships between human bodies whose desires are not limited merely to self-preservation.

The new Atlantis promises to preserve and restore the most important of the corruptible things, the human body, and so promises to preserve and restore the desires and pleasures of the human body. But as Bacon teaches in the *New Atlantis*, the preservation and restoration of desire must include the desire for more. The new science promises that human desire will be freed from the limits of the corruptible body and so from the disproportion between body and soul. The new science suggests the possibility in lived reality of what would, before the new science, be possible only in speech or imagination. The new Atlantis promises to all men what most men desire, but the teaching of the *New Atlantis* shows that the perfection of science contains possible grotesque extremes that may threaten the felicity of some or even most men. The extraordinary restraint of the sheeplike Bensalemites is necessary for the conquests of science. But if the promise of science encourages and opens the way for human conquest, it does nothing to restrain the horizons of those men who are by nature conquerors.

The combination of Bacon's open recommendation of scientific conquest with his knowledge of the fundamental moral problem of this conquest

[97] The House of Salomon contains instruments of astronomy that are kept in a "mathematical house." *Ibid.*, p. 164. The mathematical house is not a part of the "upper region" that is dedicated to the study of weather phenomena. Rather, astronomy is located in the middle region, which is the region inhabited by men, and is not accorded a highest position. Astronomy studies the heaven, then, as it affects men, but it does not study the celestial heaven, which constitutes the whole that envelops the high, the low, and the in-between. The difference between high, middle, and low is dictated simply by the location of the phenomena affecting man; in the House of Salomon, it is not a cosmic distinction. Cf. Plato, *Apology* 18b7–10, *Republic* 527d–529c3.

[98] *NA*, BW III, 165.

[99] *Ibid.*, p. 154.

was sufficient to require his prudent, circumspect, and indirect way of teaching. But the most profound and perhaps shocking reason for the apparent incompleteness or secrecy of the *New Atlantis* is its indirect teaching about those who contemplate the virtues of the new conquest and conquerors. For the wise speech that illuminates the possibilities and limits of human virtue comes from a source that represents the transgressing of those limits. The new science perfects practical life in a way that is problematic with respect to excess and moderation, but for Bacon, the nature of the theoretical life can be no basis for a defense of moderation. The very superiority of the new science consists in overcoming the distinction between theory and practice, and the *New Atlantis* teaches us that comprehensive wisdom is itself problematic precisely with respect to the possibilities of excess and moderation. The *New Atlantis* discloses that the perfection of human speech and deed, which depends on restraint and perfects humanity, points directly to human speech and deed that know no restraint and no humanity.[100] The full meaning of the promise of science is disclosed by the man who is wise in general and wise in policy: comprehensive wisdom about the meaning of science and human ends is coextensive with comprehensive political wisdom. The deepest problem of Bensalemite (scientific) rule springs from its connection to the morally unstable knowledge about conquest and moderation that illuminates the whole of which man is the constitutive part.

The comprehensively wise Joabin encompasses, in speech and potential deed, the moderation and immoderation inherent in the end of science. The speech and deed of the Baconian wise man or self-knower reveal the necessary coexistence of the moderate and the immoderate within the comprehensive good articulated by science. The speech and deed of the wise man point at one and the same time to the unified grounds of restraint and excess, moderation and immoderation. The political rule that springs from the wisest human speech and deed is necessary because of the restraint necessary for science and the regulation of human eros, and yet that speech and deed together articulate and manifest the most extreme human possibilities. The rule of science must always be unstable with respect to restraint and excess; the ironic final deed of the story is an act of double payment, an admitted excess in Bensalem.[101]

Joabin reminds us not of Socrates, but rather of Timaeus as described by Socrates. Timaeus provided the cosmogony and cosmology that preceded the account of the best city in motion,[102] the story of Athens and Atlantis. Like Timaeus, Joabin combines the excellence of policy and philosophy.[103] Like Timaeus' speech, Joabin's wise speech, which must be the final product of Bacon's great instauration, takes its bearings from the somatic and visible since, for Bacon, the only difference between image and lived reality is a temporal difference.[104] Thus Bacon, like Timaeus, views man and the cosmic whole from the standpoint of the somatic and the visible. Also like Timaeus this standpoint entails the problem of the inability of the ensouled human body to be or to imitate the body of the visible whole.[105] However, unlike Timaeus' speech, which is admittedly mythic and less than true, Bacon's speech is meant truly to illuminate lived reality. The question that arises, then, is how, for Bacon, the combination of the scientific measures of body and soul coupled with the new unconcern for astronomy and the celestial heaven produces a true science of bodies in motion.[106]

Whereas for Plato, who is Bacon's target in the *New Atlantis*, the distinction between moderate and immoderate deeds cannot be strictly demonstrated, and so is rough or indeterminate in practical life, the contemplation of the distinction between theory and practice—the contemplation of a theoretical problem—provides the sole stable ground for moderation. Thus it is the speech of the man who pursues wisdom that illuminates and buttresses the meaning of moderation. For Bacon, the speech of the man whose wisdom pursues the conquest of nature discloses the link between moderation and immoderation and subverts the stable ground of any possible moderation. Bacon teaches that comprehensive wisdom is located in political science and that political science discloses the immoderation of any moderate speech to be linked to the immoderation of any moderate deed. His teaching is breath-taking because of its audacious resoluteness. Bacon recommends that men embrace the scientific conquest of natural necessity and chance, and so urges them to embrace the necessary possibility of the most extreme moral chance. The prudent dress of Bacon's utopia is necessitated by the restraint required by science and its open promise to the many. To

[100] White misses the crucial importance of Joabin because he does not consider Joabin in the context of the literary whole of the *New Atlantis*. See above, n. 72, and White, pp. 245–46.

The complex symbolism of the feast of the Tirsan, which extols the noblest end of science and thus the human conquest and constitution of the natural whole, can be understood only in the light of the full explication of these measures.

know and embrace the full range of scientific possibilities requires a stouter and more resolute soul. Nietzsche declared of Bacon that

> the strength required for the vision of the most powerful reality is not only compatible with the most powerful strength for action, for monstrous action, for crime—it even presupposes it. We are very far from knowing enough about Lord Bacon, the first realist in every great sense of that word, to know everything he did, wanted, and experienced in himself.

It would be a slight to both Nietzsche and Bacon to think that this remark refers to the petty transgression of bribery.[107]

The *New Atlantis* is at once the core and the prolegomenon to the whole of Bacon's teaching. Bacon's prudent way requires that once the reader discovers the completeness of the *New Atlantis*, he must turn to the whole of Bacon's teaching in the light of the *New Atlantis*. For the completeness of the *New Atlantis* is the key to the unity of Bacon's teaching about science and man. The fundamental Baconian theme is the virtue of science as the highest human activity, and this theme consists in a teaching about the nature and virtue of the conquests facilitated by science. Bacon's fundamental teaching raises the questions related to the question of conquest: the questions of self-knowledge, the relationship of the active to the contemplative life, and, ultimately, the nature of and relations between the virtues of wisdom, courage, justice, and moderation. But these questions are encompassed by the question of the best regime and the ends of political life. The *New Atlantis* and Bacon's teaching as a whole are complete because they present a new, audacious, and morally problematic stance toward the traditional questions of political philosophy.

[107] Friedrich Nietzsche, *Ecce Homo*, II, 4. Hobbesian political science, which forged the link between modern science and a certain, demonstrable doctrine of political rule, was directed at the Baconian problem of moderation and was based on the pretense of just such a slight.

"Virtue, Obligation and Politics," Revisited*

RICHARD M. BANK
University of California, Santa Barbara
STEVEN R. MCCARL
University of Denver

Much contemporary literature in moral philosophy discusses how concepts condition understanding, especially because they sensitize us to certain questions and exclude others. Stephen Salkever in this *Review*[1] applied this line of reasoning to political philosophy and discovered two paradigms of politics: one based on the concept of virtue (ancient political philosophy), the other resting on obligation (modern political thought). The virtue paradigm understands politics as "a relationship among individual human beings in which some public value or law takes the place of private desire as the most authoritative guide to action." The political community, then, "is that structure (or pattern of relationships) which has as its aim the development of moral virtue among its citizens."[2] This public good, moral virtue, which leads to happiness, is intelligible only if man can possess it. Good, in other words, is grounded in human nature; one cannot do ethics without doing moral psychology.[3] Furthermore, one cannot do ethics without doing politics, because whether or not the good character potential in man is developed depends upon the kind of relationships men have, which is largely determined by politics.

The politics of obligation, on the other hand, does not assume that virtue is intelligible, or needs to be intelligible, except insofar as a belief in the value of freedom (or community) might imply some kind of limited good or virtue. It is more accurate, however, to say that the value of freedom reflects a rejection of virtue as meaningful: since characterizing the good life is impossible, the value of the ends that individuals pursue cannot be assessed except insofar as they may frustrate the purposes of others. Therefore the ideal of politics is freedom—a situation in which as many individuals as possible can realize as many of their ends as possible. The uses of liberty, or the purposes for the sake of which communities may be organized are of no consequence, because those uses or purposes cannot be evaluated. The only thing humans have in common is the common pursuit of individually determined goals (or communally determined goals): politics is only of importance as a means to liberty or community, which is established by contract.[4] Thus, the only meaningful questions are "Why should I obey the state?" and "Who is to rule?," but certainly not "What is justice, or the good life?" The paradigm of obligation focuses on "the reconciliation of the requirements (needs and desires) of the individual and the requirements of society as a whole."[5] The concern about obligation reveals the view that there cannot be a political (or any sort of public) solution to the question of the best human life, and there can hardly be anything but a prudential, as opposed to a moral, obligation to the political community.[6]

Within the virtue paradigm Salkever distinguishes three qualitatively distinct life-styles—the economic, the political, and the philosophical—which also represent three potentially dominant principles of human nature. They form a hierarchy such that the political is superior to the economic, and the philosophical is superior to the political.[7] Our position is based generally on a theory of cognitive development common to John Dewey, Jean Piaget, and Lawrence Kohlberg.[8] Specif-

* The authors wish to thank Dave Bayley, Christopher Deering, Kurt Fischer, Caroline Freeman, David Paulsmeyer, Thomas Schrock, and Peter Steinberger for their critical comments on earlier versions of this article.

Table 1. Salkever's Virtue Paradigm and Kohlberg's Cognitive-Moral Levels

The Virtue Paradigm*	Cognitive-Moral Levels**
I. *The Economic Level* Economic man is primarily concerned with the satisfaction of his selfish needs and wants. There are of course the needs common to other animals (food, self-preservation, shelter, sex, etc.), together with the range of desires unique to man, e.g., the desire to acquire material wealth. Economic man's needs are practically limitless: he is Hobbes's natural man, committed to a perpetual search for security and well-being. Accordingly, he enters into relationships only if he expects to obtain something he desires.	I. *Preconventional Level* The individual is responsive to cultural labels of good and bad, right or wrong, but he interprets these labels in terms of either the physical or hedonistic consequences of action (punishment, reward, exchange of favors), or in terms of the physical power of those who enunciate the rules and labels. Stage 1: The punishment obedience orientation. Stage 2: The instrumental relativist orientation.
II. *The Political Level or Level of Moral Virtue* Political man subordinates his selfish desires to the aims of the polis or political community. The public good replaces the private as the primary guide to action. Moral virtues such as self-control, generosity, courage and justice become important inasmuch as the possession of such virtues gives one "standing" in the community. Man enters into a political relationship because all good (moral virtue) depends on the community, and he reciprocates by serving and defending the community, its institutions and values.	II. *The Conventional Level* Maintaining the expectations of the individual's family, group or nation is perceived as valuable in its own right, regardless of the immediate and obvious consequences. The attitude is not only one of *conformity* to the social order, but of loyalty to it, of actively maintaining, supporting, and justifying the order, and of identifying with the persons or groups in it. Stage 3: The interpersonal concordance or "good boy-nice girl" orientation. Stage 4A: The "law and order" orientation. 4B: The societal value orientation.
III. *The Philosophical Level or Level of Intellectual Virtue* Philosophical man seeks intellectual virtue, i.e., the fullest possible extent of the human capacity for understanding. "He has a voracious appetite for learning. His curiosity is not like that of a craftsman who learns only what is useful in the narrow sense and whose interest is limited by his craft. The philosopher learns simply because it seems good and an end in itself." He enters into a community to learn, and because moral virtue is necessary to intellectual virtue.	III. *The Principled, Autonomous, or Postconventional Level* There is a clear effort to define moral values and principles which have validity and application apart from the authority of the groups or persons holding these principles, and apart from the individual's own identification with these groups. Stage 5A: The social-utility legalistic orientation. 5B: The higher law and conscience orientation. Stage 6: The universal ethical-principle orientation.

* Sources: Salkever, "Virtue"; the quotation describing philosophical man is from Allan Bloom, *The Republic of Plato* (New York: Basic Books, 1968), p. 392.

** Kohlberg, "From Is to Ought," pp. 164–165, 196–213; "Continuities in Childhood and Adult Moral Development," chapter 45 (manuscript) in *Moralization, The Cognitive Developmental Approach*, ed. Kohlberg and Turiel, pp. 20–41.

ically, we rely on the three levels[9] of cognitive-moral development identified by Kohlberg which parallel the three life-styles Salkever extracts from the works of Plato and Aristotle (see Table 1).[10] There are two major differences, however, between our developmental perspective and Salkever's construction and comparison of the virtue and obligation paradigms. First, for us normative

the Naturalistic Fallacy and Get Away with It in the Study of Moral Development," in *Cognitive Development and Epistemology*, ed. Theodore Mischel (New York: Academic Press, 1971).

[9] Fischer, *Piaget*.

[10] Kohlberg's own research includes a 12-year study of the same 75 boys from adolescence (ages 10–16) through young manhood (ages 22–28) at three-year intervals, plus cross-cultural studies of middle-class boys in Taiwan, Mexico, and Great Britain, together with studies of villagers in Taiwan, Malaysia, Turkey, and Yucatan. A discussion of this research can be found in "From Is to Ought," pp. 163–183. More recent studies by Kohlberg and others can be found in *Moralization, the Cognitive Developmental Approach*, ed. Kohlberg and Elliot Turiel (New York: Holt, Rinehart and Winston, 1973). For a critique of Kohlberg's methodology, see William Kurtines and Esther Blank Grief, "The Development of Moral Thought: Review and Evaluation of Kohlberg's Approach," *Psychological Bulletin*, 81 (August, 1974), 453–470. Kurtines and Grief argue that "the empirical utility of [Kohlberg's] model has yet to be demonstrated." While their argument deserves attention, it does not compromise the theoretical foundations upon which this article is based. For example, the same three levels of cognitive-moral development that Kohlberg identifies can be found in Dewey, "Outlines of a Critical Theory of Ethics," in *The Early Works*, vol. 3: *1882–1898* (Carbondale, Ill.: Southern Illinois University Press, 1969), especially, pp. 355–357. See also, Piaget, *The Moral Judgment of the Child* (Glencoe, Ill.: Free Press, 1948).

Table 2. Definition of Kohlberg's Stages*

I. Preconventional Level

Stage 1: The punishment and obedience orientation. The physical consequences of an action determine its goodness or badness regardless of the human meaning or values of these consequences. Avoidance of punishment and unquestioning deference to power are values in their own right, not in terms of respect for an underlying moral order supported by punishment and authority (the latter being Stage 4). Stage 1 thus defines the "socio-moral" order in terms of differentials of power, status, and possessions rather than in terms of equality or reciprocity.

Stage 2: The instrumental relativist orientation. Right action consists of what instrumentally satisfies one's own needs and occasionally the needs of others. Human relations are viewed in terms such as those in the marketplace. Elements of fairness, reciprocity, and equal sharing are present, but they are always interpreted in a physical, pragmatic way. The Stage 2 sense of fairness as quantitative equality in exchange and distribution between individuals prescribes positively acts of reciprocity conceived as the equal exchange of favors or blows, or as acts of cooperation in terms of a goal of which each person gets an equal share; negatively, noninterference in the sphere of another is deemed right.

II. Conventional Level

Stage 3: The interpersonal concordance or "good boy-nice girl" orientation. Good behavior is what pleases or helps others and is approved by them. There is much conformity to stereotypical images of what is majority or "natural" behavior. The sense of justice centers on the Golden Rule ideal of imaginative reciprocity rather than exchange. Related to this is a conception of equity. Since the Stage 3 individual can take the role of others in other than concrete terms, since he can consider what he would *wish* in the other's place, equity implies that it is fair to give more to a helpless person to make up for his helplessness. Behavior is frequently judged by intention—"he means well" becomes important for the first time. The socio-moral order is conceived as primarily dyadic relations of mutual role-taking, mutual affection, gratitude, and concern for one another's approval. One earns approval by being "nice."

Stage 4A: The "law and order" orientation. The individual is oriented toward authority, fixed rules, and the maining the given social order for its own sake. Justice is defined in terms of a social order of rules and roles which are shared and accepted by the entire community, and which constitute the community. In terms of role-taking, this means that each actor must orient to the other's orientation as a part of a larger shared system to which they both belong, and to which all are oriented. Justice is no longer a matter of real or ideal reciprocity or equality between individuals as dyads, but a matter of relations between each individual and the system. Questions of positive reciprocity are questions of the relation of individual work and merit to the rewards of the system; merit should be rewarded by the system and every individual must contribute to society. Conversely, "vengeance" is the right of society and is conceived not as vengeance but as "paying one's debt to society." The equality element of justice appears primarily in terms of the uniform and regular administration of the law, and as equity in an order of merit.

Stage 4B: The societal value orientation. The individual is oriented to what is behind the rules of a given social order, e.g., to the purpose of the law and rules in terms of utility or the welfare of the majority of others, the wishes, agreement and viewpoint of the majority which lie behind the rules, and the "moral law" as the consensus of society's norms and beliefs, which may still conflict with the legal law at particular points. Still, the basic orientation is "conventional." While society's specific rules are interpreted in terms of their underlying shared values and purposes, they are reflected on from society's point of view. Society's point of view is still, itself, unquestioned, and is not, itself, reflected on from some "outside-of-society" perspective.

III. Principled Level

Stage 5A: The social-contract legalistic orientation (generally with utilitarian overtones). Right action tends to be defined in terms of general individual rights and of standards that have been critically examined and agreed upon by the whole of society. There is clear awareness of the relativism of personal values and opinions and a corresponding emphasis upon procedural rules for reaching consensus. Aside from what is constitutionally and democratically agreed upon, right action is a matter of personal values and opinions. The result is an emphasis upon the "legal point of view," but with an additional emphasis upon the possibility of changing the law in terms of rational considerations of social utility (rather than "freezing" it in terms of Stage 4). The law's function is seen as adjudicating between the rights and interests of one group of individuals as opposed to another, rather than as protecting the rights of all "decent" citizens. Outside the legal realm, free agreement and contract is the binding element of obligation. The social contract, which is the basis of the socio-moral order, is a justice conception which presupposes reciprocity of the partners to the agreement and equality between them prior to the agreement, and the form of this agreement takes priority over substantive justice, once agreement has been reached.

Stage 5B: Higher law and conscience orientation. The individual identifies morality with a conception of natural rights, i.e., rights which are naturally or intrinsically defined, such as rights of life and freedom. Society's demands

* Kohlberg, "From Is to Ought," pp. 164–165, 196–213; "Continuities," pp. 20–41.

Table 2. Continued

upon the individual are valid only to the extent that they are based on a recognition of these rights which, in effect, provide the criteria for a blueprint of society, criteria by which one law or society may be said to be better than another. Accordingly, the individual defines the socio-moral order in terms of justification. With respect to limitations of freedom, for instance, reasons must be given for constraining people in the pursuit of what they take as good.

Stage 6: The universal ethical-principle orientation. Right is defined by the decision of conscience in accord with self-chosen ethical principles that appeal to logical comprehensiveness, universality, and consistency. These principles are abstract and ethical (the Golden Rule, the categorical imperative); they are not concrete moral rules like the Ten Commandments. At heart these are universal principles of justice, of the reciprocity and equality of human rights, and of respect for the dignity of human beings as individual persons. Obligation is defined in terms of "a rational being acting as a moral agent," deciding from "a disinterested point of view that allows one to make decisions consistent with the decisions of any rational agent in a similar situation." The considerations determining one's choice are those which "any rational agent" in a similar situation should consider.

development follows a cognitive-developmental sequence, making Salkever's three life-styles not only hierarchical, but empirically sequential (in time). Secondly, Salkever juxtaposes the two paradigms, claiming that they are not mutually exclusive, they are just different perspectives from within either of which the distinctions of the other are insignificant. Our analysis of the obligation paradigm leads us to conclude that it is comparable to Salkever's political man and to Kohlberg's conventional level. Thus the obligation paradigm is better understood as a stage in a developmental theory, rather than as juxtaposed to the virtue paradigm. (Similarly, the highest activity within the virtue paradigm—philosophic man—is better understood as a higher and later stage than obligation.)

As a result of employing a cognitive-developmental framework we are able to (1) clarify the relationship between intellectual virtue (philosophic man) and moral virtue (political man)—a relationship that is obscured by Salkever's approach; (2) add a provocative dimension to the literature of political theory by considering the theories of Machiavelli, Hobbes and Locke to be expressions of the conventional level of cognitive-moral development, and by briefly considering the theories of Rawls and Rousseau as expressions of the principled level of cognitive-moral development; (3) support Salkever's case for the virtue paradigm by relating the findings of contemporary moral psychologists to the history of political thought; (4) contribute to the theoretical and empirical understanding of the nature of morals; and (5) provide theoretically promising possibilities for empirical research in the field of political philosophy.

The Developmental Approach

The label "cognitive-developmental" can be applied to a variety of specific theories of social and cognitive development, but we are most concerned with Kohlberg's theory of moral development and those theories upon which his work is largely based, viz., the theories of Dewey and Piaget. At the very least these theories share three basic assumptions: (1) development involves qualitative changes in cognitive structures, i.e., changes in the organization or pattern of thought; (2) cognitive structures result from the active interaction of the organism and the environment rather than representing different levels of maturation or learning (in the sense of a direct shaping of the organism's responses to accord with environmental structures); and (3) the direction of development of cognitive structures is toward greater equilibrium or balance between the action of the organism upon the environment and of the environment upon the organism.[11]

The notion of qualitative change presupposes a distinction between mental structure and learning in general. Structure refers to the organization, mode, or pattern of response and not to specific responses determined by familiarity.[12] Suppose, for example, two children are confronted with the task of arranging a number of sticks by length.[13] If both children *organize* the problem in the same manner, e.g., by systematically comparing one

[11] Kohlberg, "Stage and Sequence," p. 348.

[12] Dewey refers to such structures as habits: "The essence of habit is an acquired predisposition to *ways* or modes of response . . . rather than bare recurrence of specific acts." *Human Nature*, pp. 40–41. Piaget and Kohlberg categorize such structures in terms of cognitive stages which form an invariant and hierarchical sequence. These stages form an order of increasingly differentiated and integrated structures to solve the same problems at different levels of complexity and abstraction. Higher stages displace (or rather reintegrate) the structures found at lower stages, and the structures of lower stages are therefore both necessary for and available at higher stages. Analogously, calculus is built upon the arithmetic skills of addition and multiplication and cannot precede them; still, the mathematician who uses calculus can also add and multiply. See Kohlberg, "Stage and Sequence," p. 351.

[13] Seriation of sticks is a standard Piagetian test. It is not an easy perceptual task as the sticks are generally between $\frac{1}{4}$ and $\frac{1}{2}$ inch different in length. A discussion of procedure and the interpretation of various responses can be found in Piaget, *Genetic Epistemology* (New York: Norton, 1971), pp. 28–29.

stick to the next, there is no difference in their structural competence. If one child arranges the sticks faster than the other (but using the same procedure), we could speak of a quantitative (as opposed to qualitative) difference in their behavior, i.e., a difference in *performance*.[14] On the other hand, if one constructs his series by systematically comparing one stick to the next while the other randomly arranges the sticks and seriates them only after a number of attempts using trial and error, we could speak of a qualitative difference in mental structure.

With respect to moral judgments, qualitative novelty involves the distinction between form and content.[15] Consider the following moral dilemma:

> In Europe, a woman was near death from a very bad disease, a special kind of cancer. There was one drug that the doctors thought might save her. It was a form of radium for which a druggist was charging ten times what the drug cost him to make. The sick woman's husband, Heinz, went to everyone he knew to borrow the money, but he could only get together about half of what it cost. He told the druggist that his wife was dying, and asked him to sell it cheaper or let him pay later. But the druggist said, "No, I discovered the drug and I'm going to make money from it." So Heinz got desperate and broke into the man's store to steal the drug for his wife.[16]

If, for example, two persons answer affirmatively to the question "Should Heinz have stolen the drug?," the *content* of their responses would be the same. But the underlying thought organization, the *form*, the reasons behind their respective responses may be quite different: e.g., one might respond that Heinz should steal the drug because if his wife died, he would have no one to cook and clean for him (Stage 2), while in contrast, the other might argue that a person's right to live takes precedence over the right to make a profit (Stage 5). In short, the same affirmative response may nevertheless reflect qualitative differences in moral reasoning.

On the other hand, qualitatively similar reasoning can be used to justify both stealing and not stealing the drug. An individual at Stage 4, for example, could argue that Heinz, as a husband, has a duty to steal the drug, while Heinz, as a citizen, has a duty to obey and respect the law. The form or structure of reasoning is the same in this instance while the content is different.

The development of moral reasoning, then, refers not to an increased internalization of cultural rules any more than the development of logic is an internalization of the linguistic forms of the culture.[17] Stages of moral and logical reasoning do not refer to cultural contents but rather to organizational structures which emerge from an interaction between an individual and his environment.[18] According to Piaget, in every relation between a living being and its environment, the former modifies the latter by imposing its own structure. In this way, physiologically, the organism absorbs substances and changes them into something compatible with its own substance (assimilation). An act of assimilation, however, requires that the organism adapt the structure it imposes to the substance to be absorbed and modified (accommodation). Psychologically the process is the same except the interaction is entirely functional: assimilation no longer alters assimilated objects in a physicochemical manner, but simply incorporates them into its own form of activity, and accommodation only modifies this activity.[19] In short, assimilation refers to an organism's active attempts to apply *schemes* to objects and

[14] Most social learning theories do not make distinctions between quantitative and qualitative changes in behavior because both specific acts and general cognitive categories (space, time, causality, etc.) are considered to be reflections of structures that exist outside the individual. Kohlberg writes: "[Stimulus-response theory] explains the learning of logical operations or 'truths' in terms of the same processes as those involved in learning a social dance step (which is cognitively neutral), or those involved in 'learning' a psychosis or a pattern of maze errors (which are cognitively erroneous)." "From Is to Ought," p. 152.

[15] *Ibid.*, p. 230.

[16] This story is based on one of the nine dilemmas which make up the Kohlberg questionnaire most often used to assess levels of moral reasoning. Each story confronts the subject with a moral dilemma, and following each story, an interviewer asks a series of questions designed to bring out the reasoning a person uses in dealing with the dilemma. A brief account of how to use and score the Kohlberg questionnaire can be found in N. Porter and N. Taylor, "A Handbook for Assessing Moral Reasoning" (mimeograph, available from the Moral Education and Research Foundation, Harvard University).

[17] Kohlberg, "From Is to Ought," p. 194.

[18] These structures are the most basic modes of connecting experienced events—e.g., the relations of causality, substantiality, space, time, quantity, logic (referring to relations of inclusion or implication between classes or propositions), and justice (the mode of organizing role-taking experiences). See Kohlberg, "Stage and Sequence," p. 350; see also Isaiah Berlin's rich essay, "Does Political Theory Still Exist," reprinted in *Contemporary Political Thought: Issues in Scope, Value, and Direction*, ed. J. A. Gould and V. V. Thursby (New York: Holt, Rinehart and Winston, 1969), pp. 328–357, especially pp. 350–351. If stages depended upon acquired associations, reasoning would vary by culture since different cultures teach different associations. While cultural factors cannot alter the form or sequence of development, they may speed up, slow down, or stop development, depending on the variety of experiences they generate. We discuss the types of experiences conducive to development below.

[19] Piaget, *Psychology of Intelligence*, pp. 7–8. Dewey draws the same parallel: "[H]abits are like [physiological] functions in many respects, and especially in requiring the cooperation of organism and environment. . . . [N]atural operations like breathing and digesting, acquired ones like speech and honesty, are functions of the surroundings as truly as of a person. They are things done *by* the environment by means of organic structures or acquired dispositions." *Human Nature*, p. 17.

events in the world, and accommodation refers to the adjustment of those schemes to the characteristics of the things to be known.[20]

For example, when an infant tries to pick up his rattle, he attempts to apply a particular scheme for grasping the rattle, choosing the scheme and adjusting it accordingly to the shape of the rattle. A "scheme" in this sense is an organized action or form of activity applied by an organism to its environment.[21] For Piaget, knowledge of objects and events in the world results from the equilibration of assimilation and accommodation precipitated by the organism's attempts to apply its schemes. Fischer describes this process:

> An infant comes to know objects by grasping them in his hand, and must often change the way he is holding his hand in order to grasp an unfamiliar object. He finds that different objects must be grasped in different ways, and that some (such as walls) cannot be grasped at all. In the same way that the child adjusts his hand to fit different objects, he adjusts his schemes to fit different objects and events. This modification of schemes is what produces intellectual growth.[22]

In this manner the very young infant *differentiates* his grasping scheme with respect to a variety of objects. At the same time he is differentiating a number of other schemes including his looking, hearing, and sucking schemes. Such schemes, built upon the reflexes of the newborn infant, are called primary schemes since the infant cannot yet intercoordinate or integrate these schemes with each other.[23] The infant at the level of primary schemes, for instance, can only grasp objects which his hand encounters, independent of what he sees. But as his grasping and looking schemes become more and more differentiated (as he gets better at looking and grasping), the infant begins to explore the connections between these schemes. The child may grasp his rattle out of his field of vision and, by accident at first, bring the rattle into view and look at it, or his hand may at random bump into an object at which he is already looking. In short, the environment presents the chance juxtaposition of schemes which the child then explores. Such behavior characterizes the beginning of the intercoordination of primary schemes. When the infant completes this intercoordination, we can speak of the secondary schemes grasping-in-order-to-look and looking-in-order-to-grasp.

Piaget describes this process of intercoordination or integration of schemes as reciprocal or mutual assimilation. In other words, component schemes incorporate (assimilate) and modify (accommodate) each other in order to form a higher-order consolidated scheme. The integrated or consolidated scheme represents a qualitative advance over its component schemes (secondary schemes are qualitatively different from and functionally superior to primary schemes). A consolidated scheme in turn is differentiated and becomes a component for higher-order integrations (secondary schemes are components of tertiary schemes, and so on). In this manner, differentiation and integration of cognitive structures imply an invariant and hierarchical sequence of cognitive stages.

The process is much the same with respect to the development of moral judgment, but the environment, instead of presenting the chance juxtaposition of grasping and looking schemes, etc., presents the juxtaposition of conflicting points of view or role expectations. For instance, in the story of the dying woman and the druggist, suppose Heinz has a Stage 4 orientation. Since his moral reasoning is conventional, he is primarily concerned with maintaining the social order and its institutions. If he takes the role of a husband, which implies the duty to "honor, cherish, and protect," he must steal the drug. On the other hand, if he takes the role of a citizen, he must consider the implications of stealing the drug as a generalized member of society: "If one person breaks the law for a good reason, then everyone will find good reasons, and everyone will break the law."[24] If he recognizes the juxtaposition of these role claims as a situation of competing institutional claims—to maintain the institution of marriage, he must steal the drug; to maintain society and its laws in general, he must not steal the drug—he will be unable to resolve such a conflict with Stage 4 reasoning. In other words, if he differentiates the claims of marriage as a social institution from the claims of society in more general terms, he must reintegrate or reconcile the competing claims from a broader, more universal perspective, viz., a perspective outside that of any constituted society.[25]

[20] Fischer, *Piaget*, chapter 2, p. 15 (manuscript).

[21] *Ibid.*, p. 12.

[22] *Ibid.*, pp. 12–13. For a more general account of the process of equilibration, see Dewey, *Human Nature*, pp. 81, 169–170.

[23] Piaget, *The Origins of Intelligence in Children* (New York: Norton, 1963). This means that an infant at the level of primary schemes does not associate his various sensory-motor understandings of objects and events. For example, his rattle is not a "rattle" as we understand it, but a series of unrelated *tableaux*: a sound *tableau*, a visual *tableau*, a tactile *tableau*, etc.

[24] Heinz could also take the role of his wife or the role of the druggist, but to do so at the conventional level would only define his duties as a husband and as a generalized member of society respectively.

[25] The process of reconciling competing claims, or the process of equilibration generally, can be characterized as a process of controlling anxiety at successive levels of abstraction. For a statement of this view in a number of related contexts, see Abraham H. Maslow, *Motivation*

The recognition of moral conflicts in terms of irreconcilable institutional claims characterizes the beginning of a movement from Stage 4 to Stage 5 or, more generally, a movement from conventional to principled reasoning. As this movement continues, the differentiation of distinct and contradictory institutional claims from the claims of society in general often generalizes so that competing claims between classes, sexes, generations, nations, etc., become relative to one's point of view. For instance, "from the Nazi point of view, it was justifiable to kill six million Jews." Since values become relative to one's perspective, the values of one society are considered just as arbitrary as the values of another. This relativistic tendency can become so generalized that morality becomes a question of personal preference—"it's moral for me."

An individual in transition from the conventional to the principled level, therefore, often appears to be at Stage 2, the stage of instrumental relativism. But there is a fundamental difference between Stage 2 and Stage "4½" relativists. An individual at Stage 2 makes judgments on the basis of selfish needs and wants, i.e., judgments instrumental to his wish. He is not aware of any other point of view and does not, therefore, question the validity of moral terms: good is what's good for him. On the other hand, a Stage 4½ relativist is aware of the social point of view (Stage 4) but denies its final validity in defining what the individual should do. There is an equally valid individual point of view with equally valid definitions of "good" and "right," this viewpoint not being necessarily selfish, but self-realizing, one of ethical egoism.[26]

A position of ethical egoism provides the foundation for the differentiation of individuals as human beings from their socially prescribed roles as spouses, citizens, etc. In other words, each individual comes to represent a source of equally valid definitions of what is good and right. The individual's self-centered view is thus generalized and integrated into a conception of individual rights: an individual can pursue what he believes to be good only to the extent that others respect his right to do so; he must therefore reciprocally respect the right of others to do the same. As we might suspect, Stage 5 retains a clear awareness of the relativism of personal values and opinions, but right action tends to be defined in terms of general individual rights, and society's demands are recognized as legitimate to the extent that they are based on a recognition of these rights. This recognition is ideally embodied in a social contract which presupposes reciprocity of the partners to the agreement and equality between them prior to the agreement.[27]

The movement from stage to stage is best characterized as a process of differentiation and integration. In parallel fashion it is a movement toward increased *prescriptivity* and *universality*.[28] A prescriptive moral structure is, at bottom, a principle, the validity of which does not depend on external events or conditions.[29] A universal moral structure is one which can be applied with consistency to any person, independent of his status. With respect to the moral value of human life, for example, the sequence of stages herein discussed represents a sequence of increasing prescriptivity inasmuch as the moral imperative to value life becomes increasingly independent of the factual properties of the life in question,[30] and it also defines a sequence of increasing universality inasmuch as successive stages define a wider circle of others subject to moral consideration and respect, from persons with physical and social status at Stage 1 to all of mankind at Stage 6. Because conventional morality is not fully prescriptive, it leads to internal contradictions manifest in conflicting and apparently irreconcilable institutional claims, and because it is not fully universal, it defines rights which are different for different social units: classes, races, generations, nations, etc. In contrast, principled morality resolves such conflicts in a stable, self-consistent manner.[31] According to Kohlberg, the general rule at the principled level is that, in situations of conflicting claims, the only valid claims are those consistent with the recognition of the related claims of others, and a claim is only final if one would uphold it as final no matter which role in the situation he were to play. This formula is a statement of reversible or equilibrated role-taking,[32] i.e., it provides a

and Personality (New York: Harper & Row, 1954), Ernest Becker, *The Birth and Death of Meaning*, 2nd ed. (New York: Free Press, 1971), and Erik H. Erikson, *Identity: Youth and Crisis* (New York: Norton, 1968), pp. 15–44, 91–141.

[26] Kohlberg, "Continuities," p. 25.

[27] *Ibid.*

[28] Kohlberg, "From Is to Ought," p. 185.

[29] For Kohlberg, "the increasingly prescriptive nature of more mature moral judgments is reflected in the series of differentiations . . . of 'is' and 'ought' (or of morality as internal principles from external events and expectations)." *Ibid.*, p. 184.

[30] The value of a person's life is successively differentiated from the value of his property possessions, his "usefulness," his family, his nation, and his individual rights, so that at Stage 6 his life is valued in-and-of-itself, independent of any other considerations. *Ibid.*, pp. 168–169.

[31] *Ibid.*, pp. 185, 213. With respect to the "Heinz example," the druggist's claim to withhold property at the expense of a life is not reversible, i.e., he could not have recognized this claim as valid in the wife's role; on the other hand, the wife's claim to life at the expense of property rights is a valid claim which she could recognize if she were to switch roles with the druggist. *Ibid.*, p. 213.

[32] Piaget writes: " . . . development [must be] regarded as an evolution governed by an inherent need for equi-

mechanism which insures that, in situations of conflicting claims, the solution can be shared by all the actors, assuming none of them know which role in the situation they occupy. The structure of this mechanism is the structure of the principle of justice as fairness, elaborated by John Rawls among others.[33]

Of course, Salkever includes Rawls among the modern political theorists in the obligation paradigm.[34] He questions the applicability of Rawls's theory of justice to the virtue paradigm primarily because of Rawls's claim that the question of the best life for man cannot be rationally or objectively answered.[35] Rawls's position with respect to the best life for man, however, presents no problems from our developmental perspective. In the first place, we use Rawls's statement of justice as fairness to define the structure, not the specific content, of principled thought (our term) or intellectual virtue (Salkever's term). The essential function of structure is organizational. Richard Peters writes: "Fundamental principles of morality such as fairness and the consideration of interests only give us general criteria of relevance for determining moral issues. They prescribe what sorts of considerations are to count as reasons."[36]

Justice as fairness, or structure or reason (rationality) in general, then, while not *sufficient* to answer the question of the best life for man, is clearly *necessary*.

Second, the principle of justice as fairness is not a simple extension of economic or rational choice —and thus irrelevant to questions of good or virtue—as Salkever suggests.[37] The principle of justice as fairness in fact presupposes the virtue paradigm to the extent that it depends on at least a minimal definition of good, a point of which Rawls himself is quite aware.[38] While justice cannot prescribe precisely what we ought to do, still it rules out certain courses of action and sensitizes us to the features of a situation which are morally relevant.[39] In this regard Dorothy Emmet argues against the claim advanced by Professor Hare and others that "universalizability,"—the rule "treat relevantly like cases alike and relevantly different cases differently"—as a strictly formal criterion, is constitutive of moral judgment. She maintains that an appeal to relevance amounts to adopting the substantive notion of fairness. Moreover, understood as impartiality in applying moral principles, universalizability takes on the substantive moral character of fairness. In other words, there is no reason to treat relevantly like cases alike, other than consistency, which is no reason at all, unless we first postulate fairness as good or right in-and-of-itself.[40]

Finally, Salkever's claim that Rawls's theory of justice cannot objectively answer the question of the best life for man is at best irrelevant to his claim that justice as fairness is inapplicable to the virtue paradigm, for the question of the best life cannot, even from within the virtue paradigm, be answered objectively. Indeed, the Greek notion of a life of intellectual virtue depends on the subjective experience of good for its content. Such experience, however, presupposes the structure of principled thought, so that from the Greek view, to achieve intellectual virtue is *at least* to achieve Stage 6 autonomy.[41]

librium." *Psychology of Intelligence*, p. 49. The same concept can be found in Dewey, *Human Nature*, especially pp. 169–170.

[33] John Rawls, *A Theory of Justice* (Cambridge, Mass.: Harvard University Press, 1971).

[34] As he does with Rawls, Salkever tends to place Rousseau in the obligation paradigm, although he admits the latter sometimes employs the language of virtue, Salkever, "Virtue," pp. 85, 92 (footnote 60). We understand both Rawls and Rousseau in terms of the virtue paradigm. Rousseau's theory of the general will is in fact fundamentally equivalent to Rawls's theory of justice as fairness. Rousseau writes: "The undertakings which bind us to the social body are obligatory only because they are mutual; and their nature is such that in fulfilling them we cannot work for others without working for ourselves. Why is it that the general will is always in the right, and that all continually will the happiness of each one, unless it is because there is not a man who does not think of 'each' as meaning him, and considers himself in voting for all?" *Social Contract*, trans. G. D. H. Cole (New York: Dutton, 1950). II.iv., p. 29. For a discussion of the structural nature of the general will, see, e.g., I. vii., p. 17; II. iv., p. 29; II. vi., pp. 35, 37; also, Allan Bloom, "Jean-Jacques Rousseau," in *History of Political Philosophy*, ed. Leo Strauss and Joseph Cropsey (Chicago: Rand McNally, 1963), p. 524. Salkever's paradigmatical scheme cannot account for Rousseau's use of the language of legitmacy and his ambiguity about the best life for man without placing him in the obligation paradigm. We understand Rousseau's concepts of legitimacy and the good life in connection with the general will, and thus within the virtue paradigm. Authority is legitimate for Rousseau only to the extent that it expresses the general will, and the life of virtue must certainly include as a minimum obedience to the general will (or legitimate authority).

[35] See Salkever, "Virtue," pp. 78 (footnote 4), 80 (footnote 13), 82 (footnote 20).

[41] This is not to suggest that in the Greek view there is no objective good unique to man's nature, only that to understand that good requires its subjective experience. See our discussion of moral understanding, below. More generally, any ethic at the principled level will have some content built into it—this is Emmet's point. We claim only that the Greek concept of intellectual virtue, Kohl-

The fact that justice as fairness emerges as the most basic principle of organizing role-taking experiences at Stage 6 provides concrete meaning to the developmental assumption that the principles of moral reasoning emerge from an interaction between the self and the social environment. It is clear that a sense of justice would not develop without the experience of social interaction, i.e., without opportunities to take the role of others. Justice, then, does not reflect the preprogrammed tendencies of a biological organism. But neither is it a direct expression of the structure of the environment, a rule imposed from the outside. It is rather the expression of an ideal equilibrium between the actions of the self toward others and the actions of others toward the self. According to Piaget, "the rule of justice is a sort of imminent condition of social relationships or a law governing their equilibrium."[42] If we then accept the developmental assumption that moral principles emerge from an interaction between the self and the social environment, it follows that there should be elements of justice present from the beginnings of moral behavior, and this is in fact the case.

The concept of justice at the preconventional level is a functional extension of the private aims of economic man. Since his is primarily a selfish motivation, economic man enters into social relationships only if such relationships promote the satisfaction of his personal needs and wants.[43] He makes a charitable contribution, for example, not for the benefit of the underprivileged, but as a tax write-off, and he attributes such motivation to others as well. Accordingly, justice at this level operates in a concrete fashion, as the quantitative equality of exchange, and as reciprocal relationships implied by the expression "you scratch my back, I'll scratch yours."[44] While reciprocal relationships continue only so long as they remain useful, within such relationships there is a sense of obligation to fulfill one's end of the bargain, a duty which defines the corresponding right of "eye-for-an-eye" retribution. Justice at this level is the justice of the marketplace and the justice of thieves.[45]

Eventually economic man comes at least to the practical recognition that society and its institutions, formal and informal, are instrumental to the satisfaction of his private needs and wants. So, without forming any critical theory of institutions, without considering whether they are what they should be, he identifies himself, his own life, with the social forms and ideals in which he lives, and repels any attack upon them as he would an attack upon himself.[46] "The demands which the existing institutions make upon him," writes Dewey, "are not felt as the coercions of a despot, but as expressions of his own will, and requiring loyalty as such."[47] Economic man thus becomes political man and, accordingly, justice no longer operates as a matter of concrete reciprocity or equality between individuals, but in terms of the relations between each individual and the system.[48] Kohlberg provides the following description of the Stage 4 concepts of justice:

> Questions of positive reciprocity are questions of the relations of individual work and merit to rewards of the system, "a good day's work for a good day's pay"; merit should be rewarded by the system and every individual must contribute to society. Accordingly, Stage 4 positive reciprocity is exchange of reward for effort or merit, not interpersonal exchange of goods or services. Negative reciprocity is even more clearly centered on the social system: vengeance is the right of society and is conceived not as vengeance but as "paying your debt to society." The equality element of justice appears primarily in terms of the uniform and regular administration of the law, and as equity in an order of merit. Social inequality is allowed where it is reciprocal to effort, moral conformity, and talent, but unequal favoring of the "idle" and "immoral," poor, students, etc., is strongly rejected.[49]

The most basic principle of justice at the principled level is equality or distributive justice, the principle that "none should be held to have a claim to better treatment than another, in advance of good grounds being produced."[50] Questions of reciprocity at this level are nothing more than questions of mutual respect. Equality and reciprocity at this level are the substantive essence of justice as fairness and, taken together, imply the imperative to treat each individual as an end in himself.[51]

---

berg's Stage 6, Rawls's justice as fairness, and Rousseau's general will are structurally compatible, despite any differences in content. See footnote 62, below.

[42] Piaget, *Moral Judgment*, p. 196, Kohlberg, "From Is to Ought," p. 194.

[43] See Salkever's account of economic man, "Virtue," pp. 80–81.

[44] Kohlberg, "From Is to Ought," p. 164.

[45] The expressions "let the buyer beware" and "honor among thieves" might be said to be statements of preconventional justice since they imply reciprocal relationships governed by preconventional concepts of obligation and retribution. Also relevant here are the descriptions of "traditional" societies found in Jean Duvignaud, *Change at Shebika: Report from a North African Village* (New York: Vintage Books, 1970); Clifford Geertz, *Peddlers and Princes: Social Development and Economic Change in Two Indonesian Towns* (Chicago and London: University of Chicago Press, 1963); and Edward C. Banfield, *The Moral Basis of a Backward Society* (New York: Free Press, 1958).

[46] Dewey, "Critical Theory of Ethics," p. 356.

[47] *Ibid.*

[48] Kohlberg, "From Is to Ought," p. 199.

[49] *Ibid.*

[50] This particular statement of the equality principle is taken from S. I. Benn and R. S. Peter, "Justice and Equality," in *The Concept of Equality*, ed. William T. Blackstone (Minneapolis, Minn.: Burgess, 1969), p. 57.

[51] According to Andrew Reck, the concept of equality

Movement from level to level (or stage to stage) depends on the opportunities for role-taking afforded by the social environment. Role-taking most generally refers to two interrelated processes: the reaction to others as like the self, and the reaction to the self's behavior from the others' point of view.[52] An individual in short must be able to think of himself in the shoes of another. Now it is very difficult for a master to think of himself in the role of his slave, less difficult for an officer to imagine himself as a private, and still less difficult for two players on opposing baseball teams to reverse their roles. This might suggest that baseball players can imaginatively switch roles only because they themselves are familiar with the role of the other. But more basically it suggests that role-taking depends on the *shareability* of roles. The master will never be the slave, nor will the slave be the master. Accordingly, master-slave relationships offer few opportunities for role-taking since neither party can easily imagine himself in the role of the other. More generally, "the *shareability* of rules and role expectations in an institution or social unit," writes Kohlberg, "rests centrally upon a justice structure underlying specific rule and role definitions."[53] In a negative sense, rules and roles which are *not* grounded in justice do not have the quality of shareability since their very nature is arbitrary: they do not exist apart from those who enunciate the rules and fill the roles. It follows that institutions better organized in terms of justice provide greater opportunities for role-taking and, consequently, for development as well.[54] From a developmental point of view, then, the political problem is one of providing just institutions, a view shared by the ancient Greeks.[55] In fact, the Greeks may have been the first cognitive-developmental psychologists.

At any rate it is clear that the notion of development had a pervasive influence on the whole of Greek philosophy and psychology. Indeed, Robert Nisbet argues that the metaphor of growth became the basis of the entire Greek world view. In this regard he quotes Professor Sambursky:

> The Greek remained closely attached to the cosmos as the result of his viewing the cosmos as a living organism, a body that can be understood and comprehended in its entirety. The Greek had a profound awareness which was characterized by his biological approach to the world of matter. The teleological principle is essentially biological and anthropomorphic, so that the first basis for the conception of order in the universe was found in the system of the world of living things.[56]

For Nisbet, the concept of *physis* best summarizes the Greek preoccupation with growth and development. He writes: "If the nature of a thing is how it

"presupposes metaphysically: 1) that each man is an independent, continuant, individual entity or substance, and 2) that each man partakes of the same essential humanity with other men." Reck, "Metaphysics of Equality," in *The Concept of Equality*, ed. Blackstone, p. 139. If we consider these propositions as worthy of respect, thus combining the principle of equality and reciprocity as mutual respect, it follows that we ought to treat individuals as ends. Along these same lines, Paul Tillich writes: "The relation of equality and justice depends on the power of being in a man and his corresponding claim for justice. . . . What is decisive is only that man is considered as a deliberating, deciding, responsible person. Therefore one had better speak of the principle of personality as a principle of justice. The content of this principle is the demand to treat every person as a person." *Love, Power, and Justice: Ontological Analyses and Ethical Applications* (New York: Oxford University Press, 1960), pp. 59–60.

[52] George H. Mead, *Mind, Self, and Society* (Chicago: University of Chicago Press, 1934) and James Mark Baldwin, *Thoughts and Things* (New York: MacMillan, 1906), 3 vols. Corresponding to the two processes of role-taking are the notions that moral judgments are based on sympathy for others and that the moral judge must adopt the perspective of an "impartial spectator" or a "generalized other." Kohlberg, "From Is to Ought," p. 190. It is an easy step from here to the claim that justice represents an ideal equilibrium of social interaction if one avoids the pitfalls of the utilitarian maximization principle. According to Rawls, decisions by the "impartial spectator" for utilitarians in general are those which maximize the total sum of happiness. Such decisions almost by definition "short-change" some individuals and are not, therefore, consistent with the process of reacting to others like the self. Rawls, *Justice*, sec. 5.

[53] "From Is to Ought," p. 193. This idea is also central to Hart's justification of the equality principle. Hart argues that any system of morality which incorporates a notion of "rights" presupposes the equality principle. H. L. A. Hart, "Are There Any Natural Rights?" in *Society, Law, and Morality*, ed. Frederick A. Olafson (Englewood Cliffs, New Jersey: Prentice-Hall, 1961). For a discussion of Hart's argument, see William T. Blackstone, "On the Meaning and Justification of the Equality Principle" in *The Concept of Equality*, p. 129. In this same regard, Rawls writes: "The primary subject of justice is the basic structure of society, or more exactly, the way in which social institutions distribute fundamental rights and duties and determine the division of advantages from social cooperation." *Justice*, p. 7.

[54] Just institutions *per se* may not be enough to generate the opportunities for role-taking necessary for development to the principled or even conventional levels. The institutions of a given social environment must be varied so as to provide, not just opportunities for interpersonal relationships, but a matrix of complex interactions. The fact that the populations of many "traditional" societies remain for the most part at the preconventional level can thus in part be explained. Kohlberg's own research in two isolated villages supports this view. Kohlberg, "From Is to Ought," p. 173. Other examples can be found in Duvignaud, *Change at Shebika*, Geertz, *Peddlers and Princes*, and Banfield, *Moral Basis of a Backward Society*. In one setting—Shebika—the case can be made that the role-taking opportunities generated by the presence of Duvignaud's research team precipitated a general movement from preconventional to conventional thought. See Duvignaud, *Shebika*, especially pp. 297–298.

[55] See especially Aristotle *Nicomachean Ethics* Book 10.

[56] S. Sambursky, *Physical World of the Greeks*, tr. Merton Dagut (New York: MacMillan, 1956), pp. 241–242, cited in Robert A. Nisbet, *Social Change and History: Aspects of the Western Theory of Development* (New York: Oxford University Press, 1969), p. 21.

grows, and if everything in the universe, physical and social alike, has a *physis* of its own, a distinctive way of growing, a life-cycle, then the task of the philosopher or scientist is clear. It is to find out what the *physis* is of each thing: to learn its original condition, its successive stages of development, the external factors such as water, light, and heat, that affect it, and, finally, what its 'end' is; that is, its final form, the form which may be said to be the ultimate 'cause' of it all."[57] The cognitive-developmental account of moral development, we might suggest, presupposes the notion of *physis*: given the biological organism we call *homo sapiens*, the development of intelligence in general and moral reasoning in particular follows a formal pattern of differentiation and integration, defining successive and qualitatively distinct stages of development; it depends on opportunities for role-taking afforded by the external environment; and it tends toward an ideal equilibrium or final form of justice.[58] But not only is developmental theory compatible with the concept of *physis* or an expression of it, a cognitive-developmental approach is at least useful if not necessary to an explication of the Greek notion of social reform.

Any psychological theory of development must account for the roles of both the organism and the environment. There are essentially three possibilities: either development proceeds primarily from the organism (nativistic, innate, maturational theories), from the environment (stimulus-response, social learning, associationistic theories), or from an interaction of the two (cognitive-developmental theories).[59] The theoretical differences between these three broad streams of thought are often subtle, matters of emphasis and interpretation. But a practical analysis of each approach, a study of their social and political implications, reveals that the differences are quite real.

If we assume that social and political institutions differ in their capacity to fulfill the "public good," i.e., that from a moral perspective some are more desirable than others (an assumption the Greeks clearly make), it follows that social reform is a moral matter and, in turn, that the determinants of moral conduct also determine the direction and degree of social change. Accordingly, if the moral is a product of human nature, if it flows from that which is native or innate, then social change must follow changes in human nature: good men *make* good institutions. If, on the other hand, the moral is an expression of the effects of social institutions upon men (the environmental position) social change must precede changes in human nature: good men *presupposes* good institutions. In contrast, if moral conduct is not an expression entirely of human nature or environmental influence, but the product of the interaction of the two, then social progress can originate from two sources: from within man and from without.

It is just such an argument which John Dewey employs to justify an interactional theory of development. For Dewey, neither the innate nor the environmental position offers a practical solution to social ills: the former relies on "an appeal to inner rectitude and benevolence" to elicit change, while the latter "throws us back upon accident, usually disguised as a necessary law of history or evolution, and trusts to some violent change, symbolized by civil war, to usher in an abrupt millennium."[60] But this argument is not Dewey's alone. We can, for example, find the same case in Aristotle's *Ethics*.[61] In his discussion of ethics and politics, Aristotle outlines a theory of social reform which appears to be based on an argument with no end, a vicious circle. A good polis, he writes, depends on good legislation which in turn depends on wise legislators. A wise legislator is one who knows the good, but he only comes to know the good if he is properly brought up and educated in good habits. To be properly brought up, however, requires participation in good institutions; in other words, a proper education depends on a good polis, which in turn depends on good legislation, and so on, *ad infinitum*. The only way to make sense of this argument is to assume that the good is a product of the interaction between man and his environment, for then change can originate both from within man and from within his social environment.

In brief, the Greek view of human nature and development is more than compatible with our

[57] Nisbet, *Social Change*, p. 22. For a standard interpretation of *physis*, see Strauss and Cropsey, *History of Political Philosophy*, 2nd. ed., p. 3.

[58] See Dewey, *Human Nature*, pp. 258–259.

[59] Maturational and environmental theories can be respectively described as involving primarily *assimilation* or *accommodation*. See Kohlberg, "The Concepts of Developmental Psychology as the Central Guide to Education," a paper presented at the Conference on Psychology and the Process of Schooling in the Next Decade: Alternative Conceptions, Minneapolis, Minn., pp. 2–3. According to the cognitive-developmental view, maturation serves to open up new possibilities, thus it constitutes a necessary but not a sufficient condition for the appearance of certain cognitive structures. The possibilities thus opened up need to be fulfilled, and for this to occur, the maturation must be reinforced by functional exercise and a minimum of experience. Piaget and Inhelder, *The Psychology of the Child*, p. 154.

[60] Dewey, *Human Nature*, pp. 10–11.

[61] Aristotle *Ethics* Book 10. With respect to Plato's conception of social reform, it can be argued that an interactional account represents an underlying premise of the *Republic*. The philosopher-kings who are to construct the "ideal" state must develop their knowledge of good without the benefit of the good institutions of such a state. But on the other hand, Socrates and Glaucon hope to derive the meaning of justice from the institutions of the Republic.

cognitive-developmental account: it is equivalent to an early expression of this theory.[62] Accordingly, the viture paradigm described by Salkever fits neatly into our developmental scheme. For Salkever there are three potentially dominant principles of human nature, each corresponding to a way of life: "If the economic life is dominated by the love of self (or of life), and the political life by love of city (and of having a 'good name' in the city), the philosophic life is controlled by the love of truth or being."[63] These three ways of life correspond respectively to the three levels of development—preconventional, conventional and principled (Table 1)—and they form not only a hierarchy but an invariant ontogenetic sequence of development as well. In the following section we demonstrate that the obligation theory of politics is an expression of conventional thought, i.e., that the virtue paradigm includes within it the obligation paradigm. In this regard we show that Machiavelli, Hobbes and Locke—all obligation theorists—base their political aims on a vision of man at the conventional level or below.[64]

The Politics of Obligation as Conventional Thought

Machiavelli has the classical view of the relationship between politics and ethics. This position is concisely described by Isaiah Berlin: "Since men are beings made by nature to live in communities, their communal purposes are the ultimate values from which the rest are derived, or with which their ends as individuals are identified. . . . Ethics . . . cannot be known save by understanding the purpose and character of the polis. . . ."[65] The point is that without a political community men are nothing, for only within a political community will common public notions of excellence arise, thereby making it possible for men to excel—to attain virtue. Virtuosity in politics is the virtuosity of the performing artist rather than the creative artist; it is action in the presence of an audience: the performance itself. The political community is the stage, the audience and the performers, in a manner of speaking. Virtuosity is the expression of politics.[66]

Machiavelli is concerned about what is good for man, but he is not willing to go beyond saying that a political community is good. The political community is good because without it no good of any kind is possible. There is also the thesis that the presence of a political community must entail some degree of such universal values as safety of life, individual freedom, and protection from deliberately inflicted harm, and that it is such values that make a political community worthwhile to human beings. It is even arguable, as H. L. A. Hart puts it, "that a human society in which these values are not recognized at all in its morality is neither an empirical nor a logical possibility, and that even if it were, such a socety could be of no practical value for human beings."[67] Machiavelli comes very close to this position when, in discussing whether or not cruelty is conducive to political stability, he says:

> I believe that this depends on whether cruelty is used well or ill. It may be said to be used well (if we may speak of using well a thing in itself bad) when all cruel deeds are committed at once in order to make sure of the state and thereafter discontinued to make way for the consideration of the welfare of the subjects. Bad use of cruelty we find in most cases where the cruel acts, though few to begin with, become more numerous with time. Those who practice the first kind may find some defense for their state in the eyes of God and man, but as far as the second class, it is impossible for them to stay in power.[68]

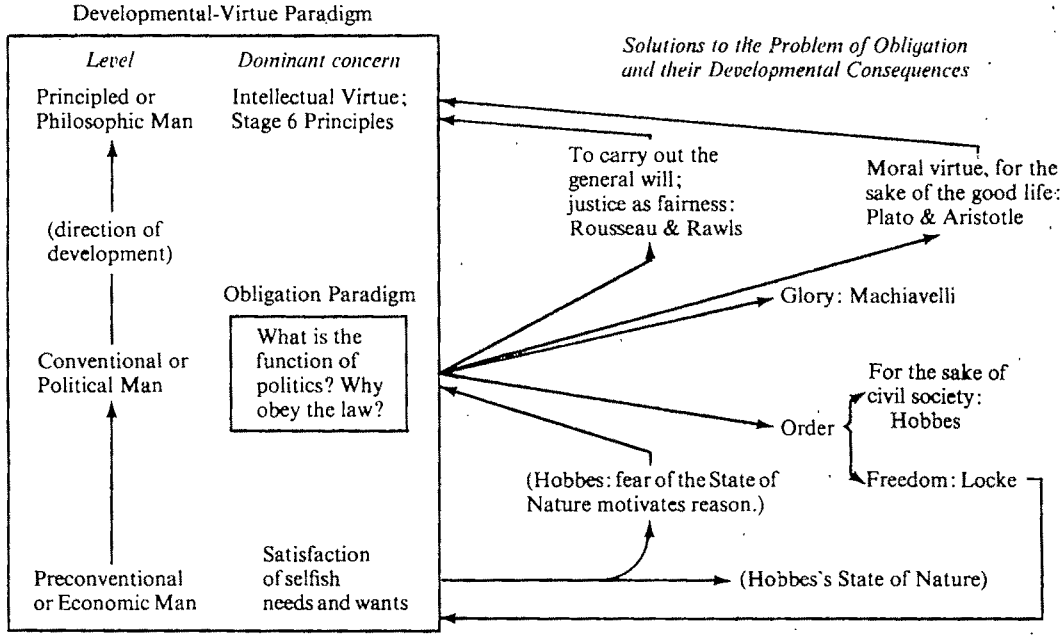
Nevertheless Machiavelli does not look upon politics as an educational process leading to moral virtue, where moral virtue entails a perspective by which to evaluate virtuosity—a perspective beyond the community (or conventional level). Machiavelli's consuming interest is the creation and maintenance of political structure.[69] By default good becomes either having a "good name" in the city (which signifies the support of the politi-

[62] The major difference between the Greek view, i.e., the virtue paradigm, and the cognitive-developmental perspective is that, from the latter point of view, the Greeks confuse form and content. For example, "intellectual virtue" has content built into it, while Stage 6 is primarily structural or organizational in character. Still, the structural component of intellectual virtue is the structure of Stage 6.

[63] Salkever, "Virtue," p. 82.

[64] Since later stages of development are reintegrations of earlier stages, the latter are both necessary for and available to the former. See footnote 12, above. Thus, while the politics of obligation is justified primarily at the conventional level, it is possible to appeal for support to the preconventional level, as Hobbes and Locke do (see Table 3).

[65] Isaiah Berlin, "The Question of Machiavelli," in *New York Review of Books*, 17 (November 4, 1971), p. 23.



[66] Hannah Arendt, "What is Freedom?" in *Between Past and Future* (Cleveland, Ohio: World Publishing Company, 1963), p. 153. Arendt also makes the interesting point that Christianity understood goodness to consist of acts unrecognized by secular man as good: only in the eyes of God, so to speak, were they recognized. Goodness then was unvirtuous, which helps explain Machiavelli's animosity to the church. Arendt summarizes: " . . . the problem of religious rule over the secular realm was inescapably this: either the public realm corrupted the religious body and thereby became itself corrupt, or the religious body remained uncorrupt and destroyed the public realm (virtuosity) altogether." Arendt, *The Human Condition* (Chicago and London: University of Chicago Press, 1958), p. 77.

[69] *Ibid.*, p. 52.

Table 3. The Politics of Obligation in Perspective: The Developmental View

cal community) or being a virtuoso (which signifies a thriving political community).

On the other hand Machiavelli argues neither that might makes right nor that politics should serve private interests. So while he is not at the principled level, he is also not at the preconventional level. Might is not justifiable as a goal; it is justifiable only in connection with the creation and maintenance of political community. Virtuosity is justifiable as an end, but it is not possible without politics. The same can be said of might, understood as virtuosity, keeping in mind the kind of limitations mentioned in connection with cruelty. Neither optimistic, nor nihilistic, Machiavelli is a modified obligation theorist who fits into the virtue-developmental paradigm at the conventional level (see Table 3).[70]

Hobbes, too, is preoccupied with the political order, but his analysis of the sources of disorder and his prescriptions for dealing with disorder distinguish him from Machiavelli. First, like Machiavelli, Hobbes does not make might equivalent to right. He maintains validity of moral judgment: power does in fact determine what happens, but power does not make it right. Leo Strauss points this out by noting that Hobbes distinguishes between unjust vanity and just fear of violent death. Had he not done so he would be in the naturalist camp where man's natural appetites —all his passions, especially vanity—are as justified by nature as is reason.[71] For Hobbes, power based on appetite cannot make itself right. Yet power as "common power"—political structure—is the source of all right, because only it can ultimately check private individual desires; practically and theoretically speaking, without it appetite and reason become equally valid.

> To this warre of every man against every man, this also is consequent: that nothing can be unjust. The notions of right and wrong, justice and injustice have there no place. Where there is no common power, there is no law: where no law, no injustice. Force, and fraud, are in warre the two cardinall vertues. Justice and injustice are none of the faculties neither of the body, nor mind. If they were, they might be in a man that were alone in the world, as well as his senses, and passions. They are qualities, that relate to men in society, not in solitude.[72]

In one respect Hobbes seems to assume a preconventional level: fear is the motive behind the reason upon which the political structure exists. On the other hand, reason is more justifiable than vanity according to nature, which does not indicate

[70] Machiavelli's views of human nature also put him in the middle, at the conventional level. His analysis of power shows that political structure is realistic, but human beings are too wicked to make the principled level realistic. For the former, see *The Prince*, pp. 24–26, 34, 52; for the latter, *ibid.*, pp. 44–45, 48, 51.

[71] Leo Strauss, *The Political Philosophy of Hobbes* (Chicago: University of Chicago Press, 1952), p. viii.

[72] Hobbes, *Leviathan* (New York: Dutton, Everyman's Library, 1914), p. 66. For similar passages in *Leviathan* supporting and enlarging this theme, see pp. 70, 74, 88–89, 116.

an "ethics" based on power (see Table 1). Hobbes seems to be both within and above the preconventional level.

Seen from the postconventional level, in terms of the relationship of the principled or autonomous level to the "common power" (the political order), Hobbes's statements on human nature do not warrant concluding that the cultivation of reason and truth through mutual respect, openness, and reciprocity will lead to justice.[73] On the contrary, we think Irene Coltman's statement accurately reveals Hobbes's rejection of the principled level:

> Their [referring to such moderate advisors to the King as Falkland and Clarendon] devotion to good causes was to Hobbes a method of rebellion. Their search for truth was a way of being disobedient just as the desire to know good and evil was the primal act of disobedience. They said that ideals transcended patriotism, in order to justify their treachery and they made themselves the sole judge of what ideals they would follow: ideals that emanated from themselves and sanctified their impulses. The good king, to them, was one who had surrendered his kingship by giving up his absolute authority. The good man was the bad citizen who followed his private truth and went his own way. Insanely complacent about letting the social order fall apart, intellectuals and all private men who claimed this sort of freedom were, Hobbes thought, the enemies of society and of civilization.[74]

The distance between Hobbes and the principled level of the virtue paradigm is evident in other interpretations of Hobbes as well. Norman Jacobson, for example, finds in the *Leviathan* not the virtue paradigm's position that there is a good for man suitable to his nature, but the notion that man can master his nature. Man accomplishes this by the power of language—man's creation, not God's or nature's. Through the creation of a scientific language the problem of order is solved. Henceforth to discuss politics is to discuss geometry; there is no time for the passions that give rise to conflicts and disorder. Objective, precise, neutralizing science becomes Leviathan. The principled or autonomous level is nowhere to be found.[75]

Hobbes occupies a middle ground between the preconventional and the principled levels.[76] No better statement to this effect exists than Strauss's:

> For, by starting from "right" and thus denying the primacy of "law" (or, what amounts fundamentally to the same, of "virtue"), Hobbes makes a stand against the idealistic tradition. On the other hand, by basing morals and politics on "right," and not on purely natural inclinations or appetites, Hobbes makes a stand against the naturalistic tradition. That is to say, the principle of "right" stands midway between strictly moral principles (such as those of the traditional natural law, on the one hand, and purely natural principles (such as pleasure, appetite, or even utility) on the other.[77]

The function of politics for Locke, as Salkever points out, is the protection of privately determined enterprises:

> The commonwealth seems to me to be a society of men constituted only for the procuring, preserving and advancing their own civil interests. Civil interests I call life, liberty, health and indolency of body; and the possession of outward things, such as money, lands, houses, furniture and the like.[78]

This position is largely a result of Locke's views of man and philosophy.[79] "What is good for man?" is not only a question beyond man's capacity to answer, it is politically irrelevant, as the practical solution is public policy that conforms to community standards. Two comments by Locke help to show this:

> We are not born in heaven but in this world, where our being is to be preserved with meat, drink, and clothing, and other necessaries that are not born with us, but must be got and kept with forecast, care and labour, and therefore we cannot be all devotion, all praises and hallelujahs, and perpetually in the vision of things above . . .[80]

[73] See especially *Leviathan*, pp. 51–54, 64, 88.

[74] Irene Coltman, *Private Men & Public Causes: Philosophy & Politics in the English Civil War* (London: Faber & Faber Limited, 1962), pp. 22–23. See also pp. 140, 161, 189–191. From within the developmental paradigm Hobbes's reaction to people like Falkland and Clarendon is justified; they do not represent an authentic Stage 6. Martin Luther King and Socrates would be authentic examples, because principled thought must include as well as surpass previous stages—loyalty to the political order (conventional level) must be maintained at the same time that principles are. Morality does not transcend the political realm; the political realm is the schoolhouse of morality.

[75] Norman Jacobson, *Thomas Hobbes as Creator* (New York: General Learning Press, 1971).

[76] The function of politics for Hobbes, according to Table 3, is "order for the sake of civil society." It is true that civil society is worthwhile because of the values it promotes—industry, culture, navigation, knowledge, arts and letters, freedom, etc. Hobbes's concern seems to be that when those values become uppermost in men's minds, then the pursuit of them may undermine civil society. It is for this reason we describe Hobbes's position as order for the sake of civil society.

[77] Leo Strauss, *Hobbes*, p. viii.

[78] Locke, *A Letter Concerning Toleration*, citation in Salkever, "Virtue," p. 87. Sheldon Wolin makes the interesting point that liberal man is not so much acquisitive as he is ultra-sensitive to his social position, which is dependent upon property. Acquisitiveness results from the fear of losing status in the eyes of the community—a Stage 4 position. Wolin, *Politics & Vision* (Boston and Toronto: Little, Brown, & Co., 1960), p. 328. On the political significance of property as economic growth, see Robert Goldwin, "John Locke," in *History of Political Philosophy*, 2nd ed., ed. Strauss and Cropsey, pp. 469–470.

[79] John Locke, *Two Treatises of Government*, ed. Peter Laslett (New York and Toronto: The New American Library, Inc., 1965), p. 396. In these passages Locke describes man as too biased to receive the plain and intelligible standards of right and wrong in the law of nature.

[80] Wolin, *Politics*, p. 298, citing H. R. Fox-Bourne, *The*

And thus all private judgment of every particular member being excluded, the community comes to be umpire, by settled standing rules, indifferent, and the same to all parties.[81]

These views culminate in the liberal position (see Adam Smith and Spencer, for example) of distributing goods by the impersonal judgment of the market mechanism, rather than by a standard of justice. This position emphasizes freedom, but without concern for evaluating what courses of action result from freedom; it is the obligation paradigm par excellence. It also describes the conventional level, because it does not offer standards or methods to define moral values and principles which have validity and application apart from the authority of the groups or persons holding these principles, and apart from the individual's own identification with these groups. This is readily apparent in the emphasis Locke places on society:

The first and fundamental natural law . . . is the preservation of society. . . . [82] [But the preservation of society is motivated by the desire for self-preservation:] The first and strongest desire God planted in man, and wrought into the very principle of their nature, being that of self-preservation. . . . [83]

Self-preservation as the means to peace and preservation is not a theory of good or obligation that goes very far. Where the preservation of the society is at odds with the preservation of the individual, society must be obeyed because without society, i.e., without a set of mutual expectations based on trust, without order, freedom would not exist.[84] But where the individual's life, and his freedom, therefore, is at stake this argument breaks down. Every theory exclusively committed to freedom encounters a dead end, because it does not offer a means of choosing between conflicting purposes (the presence of conflicting purposes is evidence of the existence of freedom).

Where the virtue paradigm sees reason and justice as man's ends (to be served by the passions) Locke sees the passion of self-preservation. From self-preservation he arrives at freedom, but he can go no further. There is no doubt that he is not at the principled level: even the questions which lead to autonomy (Stage 6) are superfluous for Locke.

Machiavelli, Hobbes, and Locke stop short of virtue; they do not see politics as education for justice. Given our interactional theory—moral conduct is an expression of the interaction of human nature and environment—then their historical circumstances help to explain why they set their sights no higher. But in more fortunate times, as in the case of classical Greece and perhaps, we venture to say, of contemporary western civilization,[85] politics can be looked upon as a process for moral development, no better expression of which can be found than that by John Dewey:

When we observe that morals is at home wherever considerations of the worse or better are involved, we are committed to noting that morality is a continuing process not a fixed achievement. Morals means growth of conduct in meaning; at least it means that kind of expansion in meaning which is consequent upon observations of the conditions and outcome of conduct. It is all one with growing. Growing and growth are the same fact expanded in actuality or telescoped in thought. In the largest sense of the word, morals is education. It is learning the meaning of what we are about and employing that meaning in action. The good, satisfaction, "end," of growth of present action in shades and scope of meaning is the only good within our control, and the only one, accordingly, for which responsibility exists. The rest is luck, fortune.[86]

From our developmental perspective, Dewey's "meaning," Salkever's "truth and being," as well as our "principles and autonomy" must be understood as the highest stage of politics. As such they come first in importance—ultimately they justify politics, yet they do not come first in time. First, politics must guarantee a minimum of security—the preoccupation of Hobbes; afford man an opportunity to display virtuosity in the sense of performing exceptionally well in terms of the political community's values—the preoccupation of Machiavelli; and guarantee man freedom in return for giving up unbridled lust—Locke's concern. The conventional and preconventional levels that these views exemplify do not ever simply go away, and neither do the functions of politics at the conventional and preconventional levels. Plato goes to great lengths to point this out; a political community always exists simultaneously at various levels:

Life of John Locke, 2 vols. (New York: King, 1876), vol. 1, p. 396.

[81] Locke, *Second Treatise*, p. 367.

[82] *Ibid.*, p. 401. Also see pp. 393–394, 412–413.

[83] Locke, *First Treatise*, p. 244.

[84] On the nature and significance of trust in Locke, see Peter Laslett, "Introduction," in *Two Treatises*, pp. 126–135. Also see Goldwin, "Locke," p. 483: "Locke is profound and comprehensive on the reasons for founding political society, but those reasons turn out to be such that he is prevented by their very character from considering in what direction society should develop after the founding is secure."

[85] James S. Coleman argues, however, that the rise of "corporate actors" restricts role-taking opportunities: ". . . when [an individual] carries out an action toward a corporate actor, he cannot see himself ever in the corporate actor's place. He will never become a corporate actor. For that reason, he will feel fewer pangs of guilt when he rips out a public telephone or steals paper from the office than he would if he had committed similar acts against a person." Coleman, *Power and the Structure of Society* (New York: Norton, 1974), p. 97. We should also state explicitly that, even in the best of environments, few persons will reach the highest levels of cognitive-moral development. See, for example, footnote 88 below.

[86] Dewey, *Human Nature*, p. 259.

this is one message of the *Republic*.[87] Justice as education for virtue is the end of politics, yes, but its realization (in degrees—never fully) is dependent upon the acknowledged importance of such functions of politics as Machiavelli, Hobbes, and Locke had in mind. Thus politics as virtue, where education for justice is the function of politics, incorporates as well as exceeds politics as obligation.

While our developmental view incorporates politics as obligation (obligation fits in at the conventional level) there is a tension between higher and lower stages within the paradigm. In the first place, the conventional level can be understood from the principled level, but the principled level cannot be understood from the conventional level.[88] Politics at the preconventional and conventional levels, and politics at the postconventional level also highlight different facets of human behavior. The politics of the preconventional and conventional levels focus on civilized man as a creature of emulation; in his effort to make something of himself, i.e., to prove himself superior to others, he creates largely arbitrary, socially recognized values upon which social stratification and inequality rest. Machiavelli, Hobbes, and Locke seem preoccupied with man in this dress. The postconventional view of politics focuses on man as he promotes equality and justice through growth and sharing, as he increasingly considers others independently of goods, status, and prestige, and as he enlarges the circle of others subject to his moral consideration and respect. Tension between these two views of politics exists, but reality consists of both.

Moral Understanding

The understanding of virtue—ethics, values, morality, or whatever term chosen—is comparable to the understanding of such phenomena as marriage in at least two respects. First, an understanding of virtue or marriage presupposes its experience, and second, a condition for the experience of either virtue or marriage is the prior acceptance of its validity. There is a difference, for example, between the experience of marriage and the experience of a trial marriage, where the relationship from the outset is understood to be provisional. The acceptance of the validity of a lasting commitment is essential to the experience of marriage (not trial marriage); an understanding of marriage is only possible, therefore, when the validity of a lasting commitment is accepted beforehand. Otherwise the experience of marriage and consequently, the understanding) does not occur. Similarly, an acceptance of the validity of virtue makes possible a participatory (as opposed to, say, an analytic) understanding of virtue.[89]

Aristotle makes two comments in the *Ethics* which support and clarify these views. He says first, "A young man is not a proper hearer of lectures on political science; for he is inexperienced in the actions that occur in life, but its discussions start from these and are about these."[90] Aristotle means inexperienced in a subjective sense. He does not mean, for example, someone who does not know what the word marriage means, but someone whose social experience has been so limited that he cannot, even imaginatively, come close to understanding marriage from the inside. Aristotle is also indicating that political science involves ethics, the understanding of which depends upon participatory experience. In this regard he says, "Anyone who is to listen intelligently to lectures about what is good and noble must have been brought up in good habits."[91] Aristotle makes this statement while trying to determine the nature of "good"; consequently, he seems to beg the question by referring to "good" habits. There is a reason for this, as Joseph Schwab points out so well: "If an argument is to appeal to experience of the inward effects and satisfactions of certain kinds of actions and undergoings, those inward effects and satisfactions must have been experienced by those the argument addresses."[92] Good habits will provide experiences of the inward effects and satisfactions to which moral arguments appeal.

Piaget carries this line of reasoning further:

> In the same way that a kind of contradiction exists in adhering to an intellectual truth from the outside (without having rediscovered and reverified it), so it can be asked whether there does not exist some moral inconsistency in recognizing a duty without having come to it by an independent method. . . . In other words, just as a pupil can recite his lessons without understanding them

[87] In this respect see Bloom, *Republic*, pp. 307–436. For example, Bloom writes (p. 410): "He shows what a regime would have to be in order to be just and why such a regime is impossible. Regimes can be improved but never perfected; injustice will always remain. The proper spirit of reform, then, is moderation. Socrates constructs his utopia to point up the dangers of what we would call utopianism; as such it is the greatest critique of political idealism ever written. The *Republic* serves to moderate the extreme passion for political justice by showing the limits of what can be demanded and expected of the city; and, at the same time, it shows the direction in which the immoderate desires can be meaningfully channeled."

[88] In the "Apology" and "Crito" Socrates understands the conventional level; he is even an expression of it: his loyalty to the polis leads to his death (although his love of philosophy was a factor as well). The jury, however, is not at Socrates's principled level, and cannot appreciate his philosophic activities. What is entailed in understanding a stage is discussed below (901–903).

[89] Fred M. Frohock, *Normative Political Theory* (Englewood Cliffs: Prentice-Hall, Inc., 1974), pp. 14–15.

[90] Aristotle *Ethics* 1095a.

[91] *Ibid.*, 1095b.

[92] Joseph Schwab, *College Curriculum & Student Protest* (Chicago and London: University of Chicago Press, 1969), p. 127.

and can substitute verbalism for rational activity, so a child obeying is sometimes a spirit subjugated to an external conformism, but does not understand the real meaning or facts surrounding the rules he obeys, or the possibility of adapting them or making new ones in different circumstances.[93]

Understanding develops in two steps: first the acceptance of validity—by faith or trust—then a testing by recreating. The commitment involved in the first step is facilitated by justice, understood as the shareability of rules, roles, and relations, or rather by the mutual respect and reciprocity involved therein. In short, justice promotes communication—the experiencing of others—without which development of higher stages is impossible. Piaget calls the process "decentering":

> We have stated that the two correlative aspects of the personality are independence and reciprocity. In contrast to the individual who has not yet reached the stage of "personality," and whose characteristics are to be oblivious of all rules and to center on himself whatever interrelations he has with his physical and social environments, the person is an individual who situates his ego in its true perspective in relation to the ego of others. He inserts it into a system of reciprocity which implies simultaneously an independent discipline, and a basic de-centering of his own activity. The two basic problems of ethical education are, therefore, to assure this de-centering and to build this discipline.[94]

The processes of de-centering, communication, justice and learning merge into a complex activity, with each process contributing to the others. Justice can therefore be considered as a means to understanding and communication, as well as the result of understanding and communication.[95]

Development to the principled or autonomous level is the aim of justice as a process. Arrival at the principled level is indicated by autonomy; the appeal of such moral sensitivities as, for example, respect for persons is internal rather than external. An understanding of Stage 6 (the autonomous or principled level) is thus available only to persons at Stage 6, for if the internal appeal is not present, then the principles of the stage will neither be attractive nor meaningful from the inside, and if they are not appealing and meaningful from the inside, they do not constitute Stage 6. Consequently, the virtue paradigm (Stage 6) is not meaningful from the obligation perspective (Stage 4), but the obligation paradigm is understandable from the virtue perspective. Salkever, on the other hand, is neutral concerning the justifiability of the two paradigms: "I have in no way 'refuted' the legitimacy (or obligation) paradigm. . . ."[96] Our position is that understanding the virtue paradigm at Stage 6 leads to accepting the obligation paradigm as a means but not an end. The obligation paradigm is an incomplete view of human nature and development; it does not go as far as the virtue paradigm does toward justice (keeping in mind that justice is open-ended, attainable only to a degree, and is not always a feasible pursuit).

If virtue did not have to be understood from the inside, then justice in practice would not be necessary: politics would not have to provide the means, justice—the reciprocity and the trust necessary to participatory understanding—to the end, justice—the shareability of rules, roles, and relations. Justice as a means to justice must be qualified, however, by taking into account the fact that people are at various stages of moral development. Policies that would lead to moral development in some cases would not in others. (It is necessary to deal with persons at their cognitive level.) This reaffirms the importance of the communicative and imaginative faculties in achieving the realistic appraisal of character and consequences so necessary for wise moral choices.[97]

The virtue paradigm's answer to "What is the best life?" is described by Salkever as rational and nonidiosyncratic, implying an objective answer that arrives at standards which hold good for all. Beyond this Salkever does not go, his purpose not requiring such a venture. To elucidate the cognitive-developmental perspective does require going further. The principles that emerge at Stage 6 do not say specifically what good is, but rather indicate considerations to which one must be sensitive.[98] These considerations turn out to be those conducive to moral and cognitive development, keeping in mind the interdependence of moral and cognitive aspects of development. For example, sharing in social roles, the product of a certain quality of moral relationships, is vital to cognitive development, and certain cognitive skills—reversibility, for example—are necessary for such moral relationships as reciprocity. We have noted the importance of trust and commitment in this process, and it is important to recall the movement

[94] *Ibid.*, p. 111–112.

[95] *Ibid.*, p. 117.

[96] Salkever, "Virtue," p. 92.

[97] Depth of moral understanding has more to do with giving moral principles content than with grasping more and more abstract theories. Giving content to such principles as impartiality, freedom, respect for persons, and consideration of interests requires an understanding of persons which is best arrived at by sharing a common life with them. Breadth of understanding is of equal importance. Awareness of complexity of roles, activities, motives, and rules is important, and knowledge of historical, political, economic, and social facts is indispensable to the process of giving principles realistic content. See Peters, "Concrete Principles," pp. 53–54.

[98] For an account of such principles, see Kohlberg, Table 2; Peters, "Concrete Principles," pp. 29–55, especially pp. 35–44; Hart, *Law, Liberty, and Morality*, pp. 70–71.

toward greater equilibrium. The goal of the developmental perspective ("good") is that kind of learning or understanding that leads to further learning and understanding. Given the fact of change in both the organism and the environment, and given the interaction theory, equilibrium must be considered a continuing process dependent upon continuing understanding. In this sense the developmental perspective is rational, nonidiosyncratic, and open-ended.[99]

Yet understanding through justice, and justice through understanding, are not always viable pursuits. There are times when the obligation paradigm is necessary (so thought Machiavelli, Hobbes, and Locke of their situations), and occasions when preconventional sensitivities are dominant (Hobbes's condition of war). But even then the future can be promising; the possibilities of man and his activities in common through politics raise ever anew the possibility of justice. The superiority of the principled level of development over the conventional (obligation paradigm) is that, having experienced the conventional stage, it can employ conventional morality when necessary, whereas the obligation paradigm is powerless to promote principled moral and political development when opportunities to do so exist.

Conclusion

At the heart of Salkever's case for the virtue paradigm is the idea that ". . . there is a direct path from the political question to the human question, since we can fully answer the question of whether or how political life is choice-worthy only on the basis of an understanding of what human beings are—an understanding, that is to say, of human nature."[100] Our position is also based on an understanding of human nature. We have argued that the nature of a thing is how it grows, that man grows (develops cognitively and morally) in the presence of justice, so human nature is to be understood in connection with justice. But the "end" of human development according to our thinking is open-ended understanding—Dewey's concept of meaning, the kind of understanding that must lead to more understanding. Justice is sensitivity to the moral principles (see Peter's four principles, or Hart's formal values) that both produce understanding (development) and yet result from understanding. Thus human nature is human development—a process of justice and understanding.

Salkever's virtue paradigm centers on the question "What is good for man?" Does such an inquiry flow from man's nature? Our argument would be yes: it is man's nature to develop, and dealing with this question is a form and a reflection of that development. Yet there seems to be a self-fulfilling hypothesis here. Once the question "What is good for man?" is entertained, the process of understanding (keeping in mind the relationship between understanding and justice) has begun, and understanding becomes the answer to the question as well as the means to answering it.

Thus the significance of the question "What is good for man?" is that it reveals man's distinctive powers of understanding and justice:[101] its presence indicates that the processes of understanding and justice are occurring, and it makes man aware of his capacity for development through these processes, thereby encouraging their continuation. This does not mean moral sensitivity cannot develop without an awareness of the developmental process itself. Rather it suggests that the moral sensibilities (and understanding, of course, since they go together) are more likely to develop and thrive where (through literature, drama, history, philosophy, religion, etc.) man's reflections of his morality are present as a continuing contribution to the development of understanding and morality. In this service Salkever's virtue paradigm performs well, especially when augmented by cognitive-developmental moral psychology.

To grasp the nature of man's distinctive powers requires the use of those powers. This observation is similar to a point made earlier in reference to the principled or autonomous level of development: that the appeal of moral principles at this level rests upon their inward effects and satisfactions (thus "autonomous"), such that persons without the experience of those inward effects and satisfactions cannot understand the moral quality of those at the autonomous level. Inside understanding is necessary to grasp the inside understanding of others. Even at the conventional level of morality a person not tuned into the group will not grasp the morality of those who are. This line of reasoning can be expanded to the generalization that it

[99] In addition to being open-ended, the developmental perspective is pluralistic: the principles of Stage 6 are not necessarily mutually compatible. The following statement by Berlin can be reconciled with a Stage 6 orientation: "The world that we encounter in ordinary experience is one in which we are faced with choices between ends equally ultimate, the realization of some of which must inevitably involve the sacrifice of others. Indeed, it is because this is their situation that men place such immense value upon the freedom to choose; for if they had the assurance that in some perfect state, realizable by men on earth, no ends pursued by them would ever be in conflict, the necessity and agony of choice would disappear, and with it the central importance of the freedom to choose." Isaiah Berlin, *Two Concepts of Liberty* (London: Oxford University Press, 1958), p. 54.

[100] Salkever, "Virtue," p. 80.

[101] Salkever notes that "Stuart Hampshire argues that any idea of human goodness depends on some idea of the 'distinctive powers of humanity.' " We are also arguing that any idea of the distinctive powers of humanity depends on some idea of human goodness. Salkever, "Virtue," p. 80.

takes a moral agent (man) to know one (man); we cannot abstract our moral sensitivities if we are to understand moral characteristics of man—the moral dimension of man being the phenomenon that separates him from other animals. To grasp the nature of man's distinctive powers requires the use of those powers.[102]

On the basis of a cognitive-developmental approach to moral psychology we have analyzed the meaning and significance of Salkever's two paradigms of political thought. Our first step was to present the cognitive-developmental theory and its findings. We then analyzed the two paradigms in terms of this theory, which required placing Machiavelli, Hobbes, Locke, Rousseau and Rawls within our developmental scheme. And finally, the nature of understanding moral principles was developed from the cognitive-developmental perspective. We assume, as does Salkever, that any account of political good (public good as opposed to private) must be based on moral psychology, that it must deal with the question "What is good for the most inclusive of all publics, the human species?";[103] We, however, go two steps beyond Salkever by showing the significance of the question, and by providing an answer to it (both of which bear upon the understanding of morality). An underlying purpose of our research is to reveal and to promote the political relevance and significance of moral psychology in general, and cognitive-developmental psychology in particular.

[102] Compare to Strauss: "Hobbes's political philosophy is really, as its originator claims, based on a knowledge of men which is deepened and corroborated by the self-knowledge and self-examination of the individual, and not on a general scientific or metaphysical theory. And because it is based on experience of human life, it can never, in spite of all the temptations of natural science, fall completely into the danger of abstraction from moral life and neglect of moral difference. Hobbes's political philosophy has thus for that very reason a moral basis, because it is not derived from natural science but is founded on first-hand experience of human life," Strauss, *Hobbes*, p. 29.

The Future of Community Control*

NORMAN I. FAINSTEIN
New School for Social Research

SUSAN S. FAINSTEIN
Livingston College, Rutgers University

It is now more than a decade since the slogan black power symbolized a radical reorientation in the movement to improve the condition of American minority groups. It is eight years since the clash between black activists in New York City and the United Federation of Teachers (UFT) linked the issue of municipal decentralization with black power under the rubric of community control. The early 'seventies have been a period of reduced militancy, but legacies of the 1960s persist. We now expect that black groups will participate in the pluralist bargaining structure (black power devoid of radical potential), and we continue to experiment with the structure of municipal government in order to make it more responsive to neighborhood-based demands. While race remains a crucial determinant of attitude in the debate over municipal reform, changes in historical circumstances have influenced the ideologies of blacks and whites so that the term community control has taken on more complex meanings and its identification with specifically racial demands has diminished. It is our purpose here to explore the meaning of community control for black and white community leaders in New York City; to investigate the importance of racial background, perceptions of city services, and neighborhood contexts in determining that meaning; and to relate our findings to the political future of urban minorities.

Two Types of Community Control Ideology

The argument in favor of community control has been made within two related, but distinguishable, ideological frameworks. The first, which we shall refer to as the *democratic model*, presents the demand for vesting governmental authority at the neighborhood level in terms of the liberal democratic tradition. According to this model individuals become alienated from government and society unless they can effectively participate in the determination of public policy as it affects them most directly:

> It is primarily at the neighborhood level that meaningful (i.e., potentially rewarding) opportunities for the exercise of urban citizenship exist. And it is the breakdown of neighborhood controls (neighborhood self-government, if you will) that accounts for the principal concerns of urban citizens. When they can neither take for granted nor influence by their actions and those of their neighbors the standards of conduct within their own neighborhood community, they experience what to them are "urban problems"—problems that arise directly out of the unmanageable consequences of living in close proximity.[1]

Size of the governmental unit is a significant limiting condition on the capacity of citizens for self-government. Large-scale units, although capable of commanding more resources and controlling a broader range of policy than small ones, permit only a minuscule proportion of the population to participate actively in decisionmaking. They submerge even fairly large minorities within a mass of competing interests and produce a majority based on the lowest common denominator. Even if his or her goal is far short of direct democracy, the reformer still must seek to break up vast governing structures if he or she is to realize any degree of citizen participation and responsive administration:

> It must be pretty clear by now that if we want to reduce time's implacable constraints in order to increase opportunities for participation, we shall have to find ways by which citizens can participate more fully in smaller units, units smaller than nation-state or megalopolis. These smaller units must be, I think, neighborhoods and cities of human proportions. This means both preserving and creating. To move in this direction is to transform into terms appropriate to modern life a much older perspective on the human dimensions of an urban polity, a perspective that the explosive and fascinating eruption of megalopolis during the past century has all but buried from view.[2]

The argument for decentralization based on democratic principles has no necessary implica-

tions for racial separatism. Kotler, who is perhaps the strongest and most romantic recent proponent of the democratic community, goes so far as to maintain that community control is a universalistic principle which, by protecting the rights of minorities, inhibits separatist drives:

> By gaining legal authority, the neighborhood government participates in the constituted power of the state. This has no value for purposes of separatism. It is not only endangered by such a policy; it is also the best protection against it.[3]

The second paradigm of community control, which we call the *race-conflict model*, stresses the utilization of the homogeneous black neighborhood as a vehicle for the mobilization of political power. As Carmichael and Hamilton wrote, "We must begin to think of the black community as a base of organization to control institutions in the community."[4] While the race-conflict model also emphasizes the importance of citizen participation for both the political education of individuals and the assurance of just outcomes, its principal thrust is the identification of geographic community with racial group. Community control thus becomes the *black* demand for participation in large cities.[5] In general the two models differ according to their preoccupation with different actors in the political system—the democratic construct is concerned with governmental processes as they involve individuals and territorially defined groups; the race-conflict model is oriented towards outcomes for groups defined by their social status.

Both models have a common root in reaction to the urban dialectic of machine and reform.[6] These two structural forms have shaped the ideology and institutions of American cities since the last century, and their clash has provided much of the drama of local politics. Although antagonistic to each other, neither machine nor reform provides a means of representation of locally based policy interests. Despite its ward organization, the machine excluded neighborhood groups interested in public goods; reform, in its achievement of centralized, professionalized city government, virtually eliminated the representational function or urban public institutions altogether. The triumph of reform has meant that in most cities policy is made by functionally organized central bureaucracies, governed by universal norms and insulated from grass-roots pressure.[7]

The democratic and race-conflict models of community control converge in their concern over the powerlessness of bureaucratic clients. They can be distinguished, however, according to the grounds on which they counter the reform values of professionalism, centralization, and universalism. The democratic model attacks the legitimacy of contemporary governmental institutions because they deprive individuals of their right to affect the formulation and implementation of governmental policy. According to the democratic argument, professionalism and centralization prevent responsiveness by public officials to the needs of constituents.

The race-conflict model contends that the reliance on universalism as a legitimating value results in discrimination against the interests of relatively deprived groups.[8] Only the winning of power by groups which have been treated discriminatorily can result in a redress of their grievances. This view is based on an evaluation of government as a zero-sum game and assumes that a redistribution of jobs, contracts, and services in favor of blacks will occur at the expense of previously favored groups. The redistributive argument is, of course, threatening to those who receive income and status from the present system; and it precipitated the acute reaction to community control which created the New York school confrontation. Holders of the race conflict ideology thus do not expect that power will be ceded to them gracefully, but rather that it must be seized through militant, although not necessarily violent, tactics. Built on a colonial analogy,[9] the race conflict model considers the situation of blacks as resulting from exploitation that can be eliminated only through radical changes in the socioeconomic structure.

The empirical dominance of one or the other

[3] Milton Kotler, *Neighborhood Government* (New York: Bobbs-Merrill, 1969), p. 93. Kotler, in this work, presents the argument in favor of neighborhood democracy in its most extreme form, and traces its roots to the origins of the American republic. Yates, however, asserts that while local democracy is often considered characteristic of the American political tradition, it was in fact more myth than history. [7] While proponents of community control promote values of lay participation, decentralization, and group particularism, they do not see these as requiring the jettisoning of technical expertise and fair treatment of individuals. Rather, they claim that reform principles have been carried out to an extreme where they produce results contrary to their original intentions.

[8] See Leonard J. Fein, "Community Schools and Social Theory: The Limits of Universalism," in *Community Control of Schools*, ed. Henry M. Levin (Washington, D.C.: The Brookings Institution, 1970), pp. 76–99.

model of community control has important theoretical and practical consequences. The theoretical question is whether the position of minority groups in America is sufficiently unique to cause them to adopt a radical ideology, or whether, despite their situation as a victimized and isolated stratum, they nonetheless remain adherents of the liberal democratic political formula. If the latter is true, then cultural values could be so strong as to outweigh marked structural differences in shaping group ideologies. While even the more moderate, democratic type of community control ideology is opposed to the status quo, it does not repudiate the concepts of individualism and majority rule that underlie American liberalism. Rather it presses for institutional forms under which those values can be better realized. Adherence to this model by blacks and Latins would signify that even the least assimilable groups in American society continue to view the world through the framework of an ideology which values individual freedom and mobility above all, and promises participation in a pluralistic society.

In practice, widespread belief in the democratic model would mean that urban political institutions could be made more flexibile and responsive without necessarily precipitating hostile outbreaks and increased polarization. Such an outcome may be viewed as either a palliative, representing minor accommodation and coöptation of dissidents, or as evidence of reformism and adaptability. The calm acceptance of Boston's little city halls[10] and New York's Office of Neighborhood Government,[11] the assimilation of many of the poverty and Model Cities programs into the regular political structure, and the willingness of big city mayors to lobby for their continuance—all these seem to point to the prevalence of the reformist rather than the radical ideology. Within that ideological framework, these developments provide evidence of minority group successes and confirm a pluralistic world view. Outside of that framework, they are evidence of coöptation which points to the truth of demystifying, group-conflict ideologies.[12]

Our hypotheses, which we test by examining the orientations toward community control of white and minority community leaders within New York City, are that (1) among both groups the holders of the democratic model of community control far exceed adherents to the race conflict model, but that, (2) because they view their group interests differently, minority leaders are willing to carry the implementation of this democratic model much farther than are most whites. This difference means that the strong racial component which persists in attitudes toward community control is expressed largely through institutional preferences rather than ideological rationales. We further expect to discover that among both white and minority leaders evaluation of the functioning of city services powerfully determines attitudes toward decentralization of authority. Finally, we predict that the institutional preferences of leaders will vary according to the particular situation in which they find themselves, and thus will differ according to the homogeneity and balance of power in any specific community.

Attitudes Toward Community Control of Community Leaders in New York City

New York City presents an especially interesting locale in which to examine attitudes toward decentralization and community control. Politics in the city is characterized by a high level of ethnic and racial consciousness. Here, more than in most other American cities, black (and to some extent Hispanic) leaders make explicit ideological appeals to racial solidarity and participate in a politics of group conflict which further heightens minority-white ideological differences.[13] In contrast to a city like Chicago, where intergroup exchanges have been made primarily within the organizational confines of the political machine, New York's weak party structures have long encouraged the public mobilization of ethnic and racial sentiment as a vehicle for enhancing the power of local leaders. As far back as the 'thirties, the efforts of blacks to enter the political process took the form of establishing citywide interest groups which articulated "racial" programs, rather than working strictly within the established structure of the declining Tammany organization.[14] When agitation on behalf of poor black and Hispanic communities surfaced in northern cities during the 'sixties, New York became a major center of racial conflict and developed ideological demands. In fact, many of the programmatic elements which would later be termed "black power" and "community control" appeared in the city during the early 'sixties in the activities of Mobilization for Youth, an agency sponsored by

the Ford Foundation's Gray Areas Program which quickly took a stance of racial militance.[15] Thus, well-developed ideological thinking should be found among New York City leaders, if it is to be found anywhere; and so should positions of racial militance.

For structural reasons, too, New York should be the place where community control ideology and opposition to it, would be most highly developed. In no other American city is the central government so highly bureaucratized and so distant—both politically and geographically—from local communities. The scale of the city means that areas designated "local" or "communities" would constitute sizable cities elsewhere in America. Thus, the official "communities" in New York which have received some increased power over government agencies in the early 'seventies are the Community Planning Districts (CPDs). The CPDs average 125,000 in population, and some have more than 200,000. Analysts of city affairs, as well as most politicians and civic leaders, have recognized for some years the problems of acute bureaucratic insulation, goal displacement, rigidity and lack of responsiveness to the environment which constitute the "bureaucratic phenomenon."[16]

During the late 'sixties, New York was rocked by severe racial conflict resulting from the efforts of some minority group leaders to effect community control over the city's largest bureaucracy, the school system. The association of community control with racial militancy (especially with "black power") was one of the factors which helped to defeat the movement, at least in its more radical form. The open warfare between minority communities and city bureaucracies on the one hand reflected the city's politics of group mobilization and the objective conditions stemming from the bureaucratic phenomenon, but on the other, contributed greatly to minority-white conflict and to the symbolic association of community control with minority solidarity and power. The very term "community control" became a condensation symbol which evoked strong hostility from many whites.

The community control controversies emphasized the need to deal with the problem of the large bureaucracies, and the inadequacy of linkage structures connecting the administrative centers of government with ordinary citizens in their neighborhoods, particularly with minority neighborhoods where citizens were both most dependent upon public services and most dissatisfied with their quality. The low legitimacy of some bureaucratic structures meant that they became centers of popular mobilization, instead of stabilizing instruments of social control.

The end of the decade could, then, be categorized by two ideological currents, an inter-racial split over community control, as well as a collective recognition that some structural changes could benefit all New York communities. The future of community control and decentralization will hinge largely on which tendency becomes dominant. Thus, New York City is a research site where the problems which have produced demands for governmental reform in many large cities are most acute, and where the relatively high degree of ideological concern about community control issues should make analysis of leadership attitudes particularly interesting in pointing to the political solutions which are likely to be adopted.

The Office of Neighborhood Government

The waning of the movement for community control was associated with continued efforts by the administration of Mayor Lindsay to deal with the bureaucratic phenomenon and the attenuation of mechanisms linking city and public. Some of the city officials who had helped to precipitate the battle for community control of education tried again to reform governmental structures, but this time with much greater caution, and in an historical context less racially charged. After two abortive attempts at establishing new community institutions, the city began an experimental program in the winter of 1971–72 called the Office of Neighborhood Government (ONG).

The Office of Neighborhood Government was aimed at establishing some degree of administrative decentralization and area-based coordination among the dozen or more agencies servicing a community planning district. A district cabinet of agency representatives was chaired by a professional district manager who, with a small staff, attempted to monitor agency performance, determine community (i.e., CPD) priorities, suggest new programs, and link the city bureaucracies with local organizations and civic leaders. In some places, the district managers created neighborhood councils, a step in the direction of community control.

ONGs were initially established in five CPDs.[17] These five experimental districts, and three additional CPDs which were chosen for comparative purposes,[18] constitute the areas from which our

[18] Brooklyn No. 5 (East New York), Bronx No. 5 (Grand Concourse), and Queens No. 3 (Jackson Heights).

data are drawn. On the whole they fall into the second and third quartiles of CPDs in terms of socioeconomic status, social problems, and racial segregation. They range from being about 20 per cent white to 80 per cent white, and are broadly representative of many areas of New York and other large American cities.[19] Information about politics in such typical yet anonymous places, and about the attitudes of their leadership structure, is therefore of interest to the urban political sociologist, particularly given the relative paucity of such data in the literature.

This paper is based upon four primary sources of empirical evidence. First, a closed-ended field survey of a total sample of 368 community leaders chosen through a reputational methodology was carried out during 1972 in four of the five experimental CPDs and in the three control districts. (The survey was pretested in the other ONG district, the Rockaways.) Second, intensive, semi-structured interviews were conducted during 1973 with a sample of 114 community leaders active in three CPDs: Bushwick, Crown Heights, and Wakefield-Edenwald. Both leadership samples included members of community planning boards, police precinct councils, community (anti-poverty) corporation boards, clergymen, officers of a wide range of voluntary organizations (such as PTA's, taxpayers and block or neighborhood improvement groups, tenants councils and race or ethnic organizations), city councilmen, state legislators, and party leaders. Third, voluntary organizations, protest groups, quasi-government agencies, and the political clubs and parties were observed directly during 1973 and 1974 in Bushwick, Crown Heights, and Wakefield-Edenwald. Fourth, all city bureaucrats (e.g., police precinct captains, district sanitation supervisors) who sat on the five ONG cabinets were interviewed in 1973. This population consisted of 78 individuals.

The next section of the paper will depend mainly on the first two sources of data, which we will designate, respectively, the *survey* of community leaders and the *interviews* with community leaders. Field observation data are used to illustrate the impact of community types on operational orientations toward community control. Finally, the cabinet interviews are examined in the last section, when we discuss the attitudes of minority-group cadres within city bureaucracies.

(An extensive discussion of sample characteristics and of methodological issues is contained in an appendix to this article which, for reasons of space, could not be printed here. Interested readers may request copies from the authors.)

[19] More detailed information is provided in Norman Fainstein and Susan Fainstein, "Political Representation and the Urban District," paper presented at the 1975 meeting of the American Sociological Association, and in Nathalie Friedman and Naomi Golding, "Urban Residents and Neighborhood Government: Profile of the Public in Seven Urban Neighborhoods of New York City" (New York: Bureau of Applied Social Research, Columbia University, June 1973).

Racial Differences in Ideological and Operational Orientations Toward Community Control

An ideology is a differentiated and logically organized set of beliefs which identifies relevant social and political actors, diagnoses the forces which constrain them, and proposes courses of action which are ethically justifiable and can lead to valued ends. The race-conflict and democratic systems of beliefs are alternative ideologies by this definition, even though they are not complete in the sense that they focus only on particular political questions and problems, and could be fitted into more general typologies of political thought.

Individuals employing the same ideological framework may have different *operational beliefs* about group interests, probable outcomes, and appropriate actions in concrete situations. For example, there is much greater consensus among Americans about the liberal ideological belief in freedom of speech than in the operational belief that communists should be allowed to speak in their communities.[20] Operational beliefs are easier to specify than are the patterns we call ideologies. And because they are more closely tied to immediate situations, they are more readily utilized predictors of behavior than are ideologies.

The survey and interviews provide evidence about both the community control ideologies and the operational beliefs of community leaders. After describing both levels of thought and analyzing some of the factors which explain differences among leaders, we will consider the implications of these findings for the possible future of community control.

Ideologies of community control. The overwhelming majority of community leaders favors some form of community control and shares one of the two ideological frameworks supportive of it. When leaders are presented with a list of city services in their CPDs, only 18 per cent of those surveyed oppose any degree of local control over the agency they *least* wish to control, the fire department (Table 1). Opposition to community control averages less than 10 per cent for the entire array of thirteen services. Of the 97 leaders whose beliefs about community control are codable into ideological types, 92 (95 per cent) advance either the race conflict or the democratic supporting ideologies (Table 2). *The evidence is unambiguous in pointing to a positive orientation toward local*

[20] Empirical evidence and a theoretical discussion of the concept of ideology versus operational or procedural beliefs is provided by Herbert McClosky, "Consensus and Ideology in American Politics," *American Political Science Review*, 58 (1964), 361–82.

Table 1. Orientation of Community Leaders Toward Operationalization of Community Control for Each of Thirteen City Services[a]

Service	Percentage Favoring Decision-Making Powers	Percentage Favoring Advisory Powers	Percentage Opposing Community Control	Percentage Don't Know/ Doesn't Matter
Recreation	61[b]	35	3	1
Drug Addict Treatment Programs	52	40	7	1
Housing Maintenance & Code Enforcement	52	38	9	1
Public Schools	52	39	8	1
Parks	50	42	6	2

Fire Protection	20	58	18	4

[a] Services are ranked in decreasing order of percentage favoring decision-making power.
[b] Percentages sum to 100 horizontally. *N*'s vary slightly, but are approximately 350 for each row.

control over government agencies by the entire community leadership stratum.

When leaders explain what they mean by community control most invoke a democratic type of ideology. About 14 per cent (see Table 2) employ an ideological framework which can be interpreted as reflecting the race-conflict type. In coding for this type of ideology we accepted rather subtle indicators of racial orientation, because the overt support for black power or racial militancy which was current six or seven years ago is almost completely absent from the interview responses. Here is a typical expression of race-conflict ideology:

> People must be made aware of their potential to influence government policy and education processes. People have to learn how to protect themselves. The crisis is immense, staggering. The biggest problem is to get the poor to participate in government. . . . We have to learn to share [power]. Black politicians should make it clear that they represent the black community. . . .
>
> We must train our people to do research and gain evidence in their favor. We're going to win. . . .

Missing from this and other race-conflict arguments are explicit statements concerning racism, the colonial status of minority groups, or the zero-sum nature of politics. Rather, the emphasis is on development of minority communities so that they can act effectively within (rather than against) governmental institutions. Outcomes and institutional processes are linked. Accountability to the community will both help facilitate community development and guarantee an adequate share of services. Nevertheless, adherents to race-conflict ideas do clearly equate "community" with minority-group collectivities, rather than with a geographical area, and their major concern is in improving the situation of racial minorities.

There are several possible explanations for the moderation shown by supporters of the race-conflict position. Minority group respondents may have chosen their words carefully in talking with our white interviewers. This stratum of leaders, however, produced the activists who participated in the urban political movements of the 'sixties, when many of them were willing to get involved in public confrontations with city officials and frequently with the police as well. Methodological factors seem to us of less importance in accounting for the lack of militant rhetoric than do changes which have taken place in the situation of minority groups. First, at the time of the interviews, the political climate nationwide was one of conservatism, declining expectations, and political "realism," all of which discouraged racial militancy. Second, minority-group community leaders had better access to governmental institutions and the political process than they did in the mid-

Table 2. Types of Ideology Used by Community Leaders Interviewed in Bushwick, Crown Heights, and Wakefield-Edenwald as Rationales for Community Control[a]

	Support Some Form of Community Control		Oppose All Forms of Community Control
	Ideology used to Rationalize Support is:		
	Race-Conflict Type	*Democratic Type*	
Minority Leaders	20%[b] (11)	80% (45)	0%
White Leaders	7% (3)	81% (33)	12% (5)

[a] Tabulation based on analysis of 97 interviews with community leaders who provided codable responses to the following question: "The Charter Commission is particularly concerned with devising ways of making city institutions more responsive to citizens. What suggestions do you have?" Interviewers probed for attitudes about decentralization, citizen participation, decision-making or advisory power for community boards, elective versus appointed boards.

[b] Percentages sum to 100 per cent horizontally. Of the 45 minority leaders, 10 are Hispanic. Three of the Hispanic leaders support Hispanic group power, and 8 of the 48 black leaders support black power. These are roughly comparable percentages. Since minority leaders tend not to focus on black-Hispanic conflict, the aggregation of black and Hispanic leaders into a single minority-group designation seems justifiable for the purposes of this analysis.

'sixties. Whether this was viewed as progress or co-optation, it seemed to have dampened rhetoric considerably, and to have led to efforts to use the system, to work through newly developed channels of communication. Finally, the need for some kind of bureaucratic decentralization and local political input had been recognized as a general problem in New York City, no longer as primarily a racial demand. Minority leaders, while having a greater stake in community control than whites, could frame their demands in terms which did not undermine the possibility of interracial coalition.

Approximately four-fifths of community leaders rationalize support for community control through a democractic-type ideology (Table 2). As the following examples (from five respondents) indicate, however, within a common ideological framework beliefs vary considerably concerning the manner in which local control should be effected and the degree of power local majorities should have over city agencies:

> There's a need for real change, change that would provide a greater voice with power to speak for those who live in the city and are victims of the existing situation. What is needed is an organization to speak for the community.
>
> * * *
>
> We need simultaneously to have community development and administrative decentralization. We need the orderly interpretation of the feelings of the community . . . so the community can have input into city offices. We need to get away from street rhetoric and to have a formal mechanism for input.
>
> * * *
>
> City agencies have become too large. I feel decentralization at this point would help; the community would set the priorities for the agencies. . . .
>
> I go for decentralization and, of course, citizen participation. I favor neighborhood boards with real power. Advisory power is just the status quo. They should have power over personnel, the budget—so as to give a chance for the community people to participate in city government and to keep city government money here. Part of the problem is that people setting policy don't live in the area they are setting the policy for. It is only a job for them.
>
> * * *
>
> To restructure the agencies you should put a member of every board or organization or of the Community Corporation [community action agency] Board into an affiliation with a service agency at a decisional level. . . . That community person should be consulted on services and priorities. If the agency doesn't perform, this liaison should finger the person responsible and report him to higher political officials. These liaisons should report monthly to the local community organization office.
>
> * * *
>
> Elected officials should give more attention to the needs of their constituency. The Borough President should have more power. The City must eliminate the superagencies and give the Borough President the authority.

This range of responses suggests that the dominance of democratic ideology among community leaders, whatever their racial background, may mask large differences in operational beliefs about community control. Qualitative examination of the interviews confirms two generalizations about these differences: first, that individuals who utilize a race-conflict ideology are certain to want to operationalize community control by giving relatively great power to local communities; but, sec-

community control (a large plurality of both minority and white leaders) encompass a great range of possible degrees and modes of operationalization. And, as we will show, although racial differences in ideological rationales for community control are fairly small, racial differences in operational beliefs are quite large.

Operational support for community control. The survey provides considerable evidence about the predictors of operational support for community

control. The main indicators of operational support derive from the item presented in Table 1. Respondents were asked whether they favored (1) local decision making or (2) local advisory powers over thirteen separate city services, or (3) whether they opposed community control altogether. Since so few people oppose community control, the practical distinction is between those who favor decision-making powers versus all others, and an aggregate indicator of their general support can be provided by the total number of agencies over which they wish to extend local decision-making powers. Using these indicators of operational support for community control, we find that the racial background of community leaders is a significant predictor of degree of operational support, but that income, education, religion, partisan affiliation and extent of organizational activity are not correlated with such support.

If we examine the first column in Table 1, we see considerable range in the percentage of respondents favoring decision-making powers over the various services. The services are ranked according to this percentage, which is greatest for recreation (61 per cent) and least for fire protection (20 per cent). This large range suggests that community leaders judge the particulars of each service separately, rather than having an undifferentiated response set toward community control. Table 3 shows that willingness to operationalize community control seems to depend upon a complex assessment of the conditions affecting a given city service.

With one exception rank order is similar regardless of race, even though a greater percentage of minority than white leaders operationally support community control over every single service.[21] The percentage of minority leaders showing high support is, in general, between 15 and 20 per cent greater than the white percentage. The largest interracial differences are in support for community control of drug addiction programs, housing maintenance, schools, health services, sanitation, and police protection (20 per cent or more in each case; Table 3). For each service, the race of a leader is a statistically significant predictor of the leader's degree of support for community control (i.e. for local *decision-making* power). Gamma correlation coefficients range between .29 and .53, with all significant at better than the .05 level.

[21] The only service with a ranking that differs significantly depending on the race of leaders is police protection. Presumably this may be explained by minority leaders assigning a much higher priority to controlling the police because of their greater interest in changing current police practices.

Table 3. Orientation Toward Community Control of Minority and White Leaders for Each of Thirteen City Services[a]

Service	Percentage of Each Racial Group Favoring Decision-making Powers[b]		Gamma Correlation between Race and Decision-making Powers	Significance of Chi-square with 1 df; *P* Less Than:
	Minority	White		
Recreation	71	56	.37	.01
Drug Addict Treatment Programs	69	43	.48	.001
Housing Maintenance and Code Enf.	66	45	.44	.001

Subway & Bus Lines	37	21	.36	.01
Fire Protection	33	14	.51	.001

[a] Services are ranked in decreasing order of percentage of *all* leaders favoring decision-making powers (as in Table 1).

[b] Based on *N* favoring decision-making powers, advisory powers, or opposing community control for each racial group. *N*'s vary slightly, but are approximately 350 for each row.

Table 4. Index of Minority and White Operational Support for Local Decision-making Power over City Services

Rank		(Range of Scores[a] Included in Rank)	Minority	White	All
Least Support	0	(.00–.08)	17% (21)	31% (74)	26% (95)
	1	(.09–.25)	10% (12)	16% (39)	14% (51)
	2	(.26–.50)	18% (22)	19% (46)	19% (68)
Most	3	(.51–.69)	16% (20)	17% (40)	17% (60)
Support	4	(.70–1.000)	39% (47)	17% (41)	24% (88)
			100% (122)	100% (240)	100% (362)

Gamma = .41
Chi-square = 23.44 with 4 df;
P less than .0001

[a] Index score = number of services over which respondent favored *decision-making* power divided by number of services rated in terms of "decision-making," "advisory," or "opposed to community control." Services for which response was DK or "Doesn't Matter" are excluded from the computation, and respondents with 4 or more such exclusions are eliminated from the tabulation. The resulting scores are essentially the percentage of the thirteen city services over which respondent favored decision-making powers. Almost all respondents in the lowest rank "0" did not favor decision-making powers over any services; while those in the highest rank "4" favored such powers over 10 or more of the thirteen services.

Racial differences in support for community control are presented in a more simplified form by the index described in Table 4. As would be expected from the previous findings, minority leaders score considerably higher on the index than do whites. Only 17 per cent of minority leaders, but 31 per cent of white leaders, fall into the lowest index rank; while 39 per cent of minority leaders and 17 per cent of whites show the highest level of support for community control. The Gamma correlation between race and the five-rank index is .41. *Thus, there are consistently large interracial differences with regard to degree of operational support for community control despite similar ideological rationales and similar overall support for some kind of local citizen participation.*

This apparent anomaly is, in part, explained by the existence of other political beliefs according to which blacks and whites differ. Our data, in fact, point to such an attitudinal correlate of operational support. Using a two-item index of support for citizen militancy, we find considerably greater support for militancy among minority leaders than among whites (Gamma = .62; Table 5). Furthermore, there is a strong correlation between support for militancy and for community control (Gamma = .42; Table 9). A factor, therefore, which accounts for greater minority support for community control is the predisposition of minority leaders toward citizen militancy. Intraracial variation in orientation toward community control can likewise be partially explained by this attitudinal correlate (see Table 9, columns 2 and 3).

General political beliefs offer one explanation for varying attitudes toward operationalizing community control. Another explanation relies on analysis of the overall structural position of minority groups in American cities. Eisinger argues that the social position of individual respondents is less important in accounting for racial differences in support for protest activities than is the structural position of the group with which individuals identify.[22] By this logic minority leaders would support community control more than whites if the interests of minority groups are advanced by community control to a greater extent than those of whites. The process by which community leaders come collectively to represent their racial groups need not be conscious and is, in any event, not accessible to us without additional data.

Race constitutes a dominant and continuously functioning structural force shaping the interests and beliefs of community leaders. Further factors, arising out of the specific political situations in which individuals find themselves, assist in explaining the variations within racial groups. These situationally specific factors include perception of the quality of city agencies, experience with actual instances of decentralization and community input, and the relations among social groups in the community. Stress upon the importance of situationally specific beliefs about the costs and benefits of operationalizing community control should not obscure the importance of race as a discriminating variable. It does, however, point to the complex set of cross-cutting cleavages and interests to which community leaders are sensitive.

[22] Peter K. Eisinger, "Racial Differences in Protest Participation," *American Political Science Review*, 68 (June 1974), 592–606.

Table 5. Support for Citizen Militancy by Minority and White Community Leaders

Rank on Index of Support for Citizen Militancy[a]	Minority	White	All
Lowest	6% (7)	20% (44)	15% (51)
Intermediate	74% (85)	76% (169)	75% (254)
Highest	20% (23)	4% (9)	10% (32)
	100% (115)	100% (222)	100% (337)
Gamma = .62			
Chi-square = 29.78 with 2 df; *P* less than .0001			

[a] The index is based on two questions from the survey with which the respondent could strongly agree, agree, disagree, or strongly disagree:

(1) Tenants are justified in organizing a rent strike if the landlord fails to make needed repairs in a building.

(2) Sometimes violence is necessary to bring about important changes in society.

Forty-four per cent strongly agreed with the rent strike item, and 39% agreed; 9% strongly agreed with the violence item, and 27% agreed.

The index was constructed so as to clearly identify individuals at the two extremes of support for militancy. Only respondents who *strongly* agreed with the violence item were labeled "highest supporters." Those who disagreed or strongly disagreed with *both* items were placed in the "lowest support" category. Those who agreed with the violence item and agreed or strongly agreed with the rent strike item were designated as "moderate supporters" of militancy. There were six cases where an individual agreed or strongly agreed with the violence question but disagreed or strongly disagreed with the rent strike question. These cases were designated as "logical errors" and not included in the index.

Situational Factors Affecting Operational Support for Community Control

Our evidence suggests three situational factors which influence attitudes toward community control. First, the more dissatisfied leaders are with governmental performance, the more likely they are to favor community control. Second, like the doctors who support Medicaid when they find it in fact raises rather than lowers their incomes, leaders who have had favorable experience of actual programs of decentralization and community control indicate higher levels of operational support for community control. Third, the operational model of community control which leaders desire to see implemented is strongly influenced by the racial composition and political organization of their local districts. These propositions reflect situationally specific interest cleavages which cross-cut the basic interracial divisions among community leaders.

Quality of agency performance. Leaders show considerable variation in their evaluations of the performance of different city agencies in their districts. The average evaluation of city services also varies among the districts, and does so in a manner which probably reflects objective reality (see Table 7). While there is an overall correlation between race and rank on an index of service evaluation (Table 6), closer analysis shows that this association is minimal or even reversed in three of the seven CPDs. These data suggest that leaders' perception of the quality of services is tied to factors situationally specific to each agency and to each CPD.

Table 6. Racial Differences in the Evaluation of the Quality of Local City Services

Rank on Index[a]	Minority Leaders	White Leaders	All Leaders
1. Most Positive Evaluation	26%	38%	34%
2. Intermediate	29	35	33
3. Most Negative Evaluation	46	27	33
	101%	100%	100%
Gamma = .29	*N* = 122	*N* = 240	*N* = 362
Chi-square = 13.02 with 2 df; *P* less than .002			

[a] Respondents were asked to rate the quality of each of thirteen city services in in their own Community Planning District on a five point scale from excellent to very bad. The services were the same as those in the community control item.

The index is based on a summation (weighted by score) of the number of services each respondent rated "very bad" or "bad" divided by the number of services rated "excellent," "good," "fair," "bad," or "very bad." This index was divided into ranks at the 34th and 67th percentile.

Table 7. Racial Differences in the Evaluation of the Quality of Local City Services for Leaders from the Same Community Planning Districts

Community Planning District	Percentage of Each Group of Leaders Falling into the Lowest Rank (Most Negative Evaluation) on the Service Index[a]			Racial Differences Within Districts
	All Leaders from District	Minority (a)	White (b)	(a) minus (b)
East N.Y. (Brooklyn)	46% (N=50)	63%	38%	25%
Bushwick (Brooklyn)	43 (N=49)	59	23	36
Jackson Heights (Queens)	33 (N=55)	47	25	22
Grand Concourse (Bronx)	32 (N=56)	70	24	46
Crown Heights (Brooklyn)	32 (N=50)	27	36	−9
Wakefield-Edenwald (Bronx)	26 (N=51)	32	22	10
Washington Heights (Manhattan)	24 (N=51)	22	24	−2

[a] This index is defined in Table 6. Note that respondents are ranking the services in *their own* Community Planning Districts.

The evaluation of city services is negatively correlated with operational support for community control, and this correlation remains unchanged when minority and white leaders are examined separately. Table 8 shows these relationships most simply by cross-tabulating the variables in dichotomized form. (Table 9 shows similar Gamma correlations for the full indexes.) Within the minority group, there is a 17 percentage point difference in positive support for community control between those with lower and higher rankings on the service index (Gamma = .34); within the white group, the difference is 19 per cent (Gamma = .39). Thus, the overall perception by leaders of the quality of city services apparently influences their willingness to operationalize community control over those services. We have also examined these relationships for individual services, and our findings are identical. The correlation within each social group between an index of service evaluation and com-

Table 8. Racial Differences in the Relation between Support for Community Control and Evaluation of the Quality of Local Services

	Minority		White

Table 9. Summary of Predictors of Operational Support for Community Control for All Leaders, and for Minority and White Leaders Examined Separately

Predictor	Gamma Correlations between Rank on Index of Support for Community Control and Specified Variables for: All Leaders	Minority Leaders	White Leaders
Race (Minority Status)	.35*[e]	—	—
Education[a]	−.05	.09	−.02
Income[b]	−.04	−.03	−.03
Index of Support for Militancy[c]	.42*	.31*	.38*
Index of Evaluation of Quality of City Services[d]	−.28*	−.28[f]	−.26*

[a] Four rank index.
[b] Five rank index.
[c] Three rank index using categories specified in Table 5.
[d] Three rank index using categories as specified in Table 6.
[e] All coefficients marked with an asterisk are significant using a Chi-square statistic at .05 level or beyond.
[f] This cross-tabulation has 15 cells (since the community control index has five ranks), and 8 df. Collapsing either or both of the indexes produces a Chi-square significant at better than .05 and a Gamma higher than .28. (See Table 8.)

munity control attitudes is replicated service by service. The more negatively a leader rates a particular service (say, police protection in his CPD), the more likely the leader is to favor local decision-making powers over that service.

Nevertheless, analysis of Table 8 (and examination of service-by-service relationships) also shows that the basic disparity in support for community control *between* racial groups is not eliminated when service evaluation is partialled out. Among the leaders with lower service evaluations, 64 per cent of minority leaders, but only 48 per cent of whites, indicate higher support for community control. This 16 percentage point difference within service-evaluation groupings is comparable to the differences within each racial group when service evaluation is a variable. Computation of correlation coefficients between race and community control for the higher and lower service-evaluation groupings produces Gammas, respectively, of .38 and .33, which are almost identical to those between community control and service evaluation within each racial group. (Table 9 shows similar results using the full indexes for the two variables.) We conclude, therefore, that the structurally rooted factor of race and the situationally specific factor of service evaluation are equally important as predictors of the dependent variable. Jointly, they explain a good deal of the variance in levels of operational support for community control.

Experience with programs of decentralization and community control. Since 1969 New York City has established a number of programs intended to produce administrative decentralization and mechanisms for local input or community control. The most significant programs involving to some degree both elements of institutional change are the Community School Boards and the Office of Neighborhood Government (ONG). The response of community leaders to each of these programs provides additional evidence about the way situational factors affect the basic racial cleavages in operational support for community control. Each presents leaders with a concrete institutional form and actual experience. In these instances, the operational orientation of leaders need not depend entirely on deductions from general propositions.

In actual practice, community control of schools in New York took a much less radical form than white critics had feared or than minority advocates had desired during the period of major interracial hostility in the 'sixties. The thirty-odd community school boards have been, in general, dominated by groups supportive of educational professionalism. This leads us to expect that, at the least, white opposition to community control of education would be lessened by contact with the new institutional arrangements, although it is not clear what effect these arrangements might have for minority leaders.

Table 10 presents data on support for community control of schools among self-identified specialists in educational problems. White educational specialists indicate much higher approval of community control of education than white non-specialists. Sixty-six per cent of the white specialists, as opposed to 37 per cent of other white leaders, endorse local decision-making powers over schools.[23] This suggests that familiarity with the actual operation of school decentralization has created support for its continuation.[24]

[23] The percentage of white specialists most supportive of community control of schools is identical to the percentage of all minority leaders in this category. There is no difference between minority specialists and other minority leaders, however. From additional analyses, we also know that white specialists and nonspecialists do not differ from each other in their support for community control over other city services. Moreover, the relationship between specialization and support for community control over the institution with which leaders are most familiar does not hold for other city services.

[24] It does not tell us whether our sample of white specialists has increased its level of support from what it was prior

Table 10. Orientation toward Community Control of Schools of White and Minority Leaders by Problem Specialization[a]

	Minority		White	
	Educational Specialists	Nonspecialists	Educational Specialists	Nonspecialists
Oppose Community Control of Schools or Favor Only Advisory Powers	33% (8)	35% (34)	34% (13)	63% (126)
Favor Decision-making Powers Over Schools	67% (16)	65% (63)	66% (25)	37% (75)
	100%(24)	100% (97)	100% (38)	100%(201)
Gamma = −.04 Chi-square = .03 with 1 df; *P* less than .80			Gamma = −.53 Chi-square = 10.65 with 1 df; *P* less than .01	

[a] Leaders were asked which one of a list of "problems" they had "the most experience dealing with" in their community planning district. Those who identified schools are designated educational specialists.

ONG presents a second example of a governmental program which provided a concrete stimulus for leadership attitudes. As we will discuss shortly, ONG constituted only a step toward community control, and the program was introduced in a way least likely to exacerbate latent racial cleavages. Probably as a result of these specific aspects of the ONG innovation, the response of community leaders in Bushwick, Crown Heights and Wakefield-Edenwald to ONG reflected no racial division.[25] Fifty-eight per cent of minority leaders interviewed expressed positive evaluations of ONG; 18 per cent gave mixed evaluations; and 18 per cent were negative (3 of the 60 minority leaders had uncertain opinions). The white breakdown was virtually identical, with 58 per cent positive, 16 per cent mixed, and 13 per cent negative (4 of 31 white leaders were uncertain). These findings underline once more the complexity of forecasting leadership responses to actual programs. The politics of implementation of community control does not depend on leadership ideologies and general attitudes alone. Predicting the impact of specific programs requires taking into account situational factors, such as the process by which institutional innovation is effected and the particular interests which leaders think are being served in the actual instance.

Types of communities. Several dimensions are involved in a typology of neighborhoods which would explain variation in the politics of community control. First, the social class of residents should indicate their level of dependence on governmental services and bureaucracies. Second, racial composition is obviously important given what we know about the general correlation between race and operational support for community control. Third, social divisions within a single neighborhood and the relative power of the various groups within the community affect their interests in institutional change. Such dimensions help identify how leaders measure the effects on their constituencies of alternative programs of administrative decentralization and community control.

Brief examinations of the Bushwick, Crown Heights, and Wakefield-Edenwald districts illustrate how community type affects orientations toward local control. Bushwick is the most ethnically pluralistic yet homogeneously poor of the three CPDs. It is divided among a shrinking white population of Italian and German ethnicity (25 per cent of the total), blacks (30 per cent) and Hispanics (45 per cent). Most people in Bushwick are working or lower class. The district had a median income in 1969 of about $6500, or $400 less than the New York City norm. In Bushwick, the primary concern of all groups of leaders seems to be community development, both in an economic and social sense. The relative lack of civic leadership is seriously compounded by the virtual desertion of the district by partisan political organizations. The main centers of community activity and of linkage with city government are the community corporation (originally a community action agency under the federal poverty program) and ONG.

to 1969, or whether there has been selective recruitment into the educational arena of whites who favor community control of schools. If viewed with caution, however, the data do seem to describe a cleavage which results from situational experience with, or vested interests in, actual programs.

[25] The following data are drawn from Fainstein *et al.*, "Community Leadership and the Office of Neighborhood Government. . . ."

Bushwick leaders emphasize the need to increase public services in the district and see community control as a means for doing this. But control in Bushwick must be advanced in spite of the inactivity of the population. Thus, leaders believe that new institutional structures should not be premised on widespread community participation. Rather, Bushwick needs more professionals who would act as its advocates within the city bureaucratic arena. According to this conception, community control in Bushwick might take a technocratic form, with ONG and community corporation professionals advancing the interests of the Bushwick community through virtual rather than mandated representation of the larger population.

Crown Heights falls between Bushwick and Wakefield-Edenwald in terms of both racial and economic composition. Blacks are in a numerical majority, comprising 75 per cent of the population, with the remainder divided between a small Hispanic group (5 per cent) and whites (20 per cent), most of whom are Jews. The Jewish population is dominated by a tightly knit sectarian community of Hasidim. The 1969 median income was $7,500. Both blacks and whites are divided along economic lines. Many blacks (approximately 50 per cent) are homeowners and thereby rooted in the district, while the Hasidim are also rooted, but for religious and cultural reasons. The politics of Crown Heights is defined by a sharp cleavage between homeowners and renters, which is reflected in splits within the Democratic party leadership. Crown Heights has a high level of civic activity among all social groups. The Hasidim, however, have political power far beyond their numbers in the district, both because they have religious ties with bureaucrats in the central city government, and because they have been able to vote as a disciplined bloc in local elections (something the blacks have not accomplished). As a result of their voting power, the Hasidim have considerable influence in one of the Democratic party clubs and dominate the board of the community corporation. The major vehicle linking the black majority with government agencies is a community board created by ONG. The board represents local civic organizations and is controlled by black groups.

Black leaders in Crown Heights strongly favor community control through the ONG community board. They feel they need a vehicle for resolving conflicts among civic and partisan organizations, so that the "community" can focus its attentions on collective development. They want representation on any local board, however, to reflect the interests of communal groups in proportion to their share of the population. Because the Hasidim dominate popular elections, black leaders prefer to have an appointed board. The Hasidim, for their part, would like to maintain the status quo. They are probably correct in seeing any form of community control as likely to be disadvantageous for themselves since they are a numerical minority in the CPD. In the context of Crown Heights, the politics of community control centers about maintaining unity within a popular majority beset by cleavages, and balancing democratic norms against the power of a unified minority fearful of being overwhelmed at the local level.

Wakefield-Edenwald is a relatively well-off district almost three-quarters white (primarily Italian). Most whites are homeowners as are almost half of the black residents. The district is politically conservative. Homeowners are concerned with maintaining property values and a high level of "hard" services (e.g., sanitation, fire). There are many organizations in the district, with a cohesive structure of civic leaders who tend to be alienated from the relatively active Democratic and Republican clubs. The black lower class (perhaps 10 per cent of the entire population) is segregated into a remote corner of the CPD where a public housing project is located. This part of the black community is politically disorganized. Black homeowners participate in civic organizations, but not in partisan ones; their interests differ little from those of the white majority, and racial agitation is rarely evident.

In Wakefield, community control is seen as a vehicle for giving this geographically remote CPD a greater share of city resources and a local say over how these will be distributed. The emphasis is on decentralization rather than community power. Few leaders desire the establishment of a local board with decision-making powers, though most would like to see the community consulted by city bureaucrats. The minority of leaders who are active in the political clubs want elected officials to have more power, while the civic leaders are suspicious of politicians and want any structures of local input to be nonpartisan. Wakefield does not suffer from the problems of Bushwick or Crown Heights, and neither does it present much of an indigenous force for community control.

These sketches of three very different types of communities suggest the ways in which local situational factors influence the politics of community control. The descriptions of the three CPDs also call attention to the dynamic elements which must be considered in making any predictions about community control. In the next section we further examine these dynamic forces, but this time at a citywide and national level.

Community Control: A Prognosis

The future of community control, as an issue and an ideology, will be determined by a combination of factors deriving from broad ideological currents, national and citywide policies, and specific

local situations. The continued dominance of the democratic model, and in fact the continuation of community control as a meaningful organizing concept around which to center discussions of local politics, depends on a variety of different inputs, some of them unpredictable. The phrase community control had no particular significance when Banfield and Wilson published their path-breaking text on urban politics in 1963;[26] its disappearance from the urban scene might be just as sudden. In this section we examine the variables at the citywide and national level which affect the debate over community participation in policy making and implementation, and which will determine its longevity as an issue.

Citywide Factors. New York City presents two contrasting cases of the implementation of experiments in community participation and administrative decentralization—one in school decentralization that culminated in a crisis, and the second, the Office of Neighborhood Government (ONG), which was accepted calmly. While a significant factor in differentiating the reactions to the two experiments was the difference in militancy of the times in which they occurred, an important contributing cause also was the strategy pursued by governmental policy-makers. Comparison of the city government's role in these two experiments should help to isolate some of the variables which can make community control into a more or less controversial issue.[27]

In 1967 the New York City Board of Education, in response to great dissatisfaction with the school system expressed by vocal black parents, and at the prompting of the Ford Foundation, set up three demonstration school districts (IS 201, Two Bridges, and Ocean Hill-Brownsville). Their declared purpose was to show the effects of placing limited control over school policy at the community level. The three demonstration districts quickly elected governing boards which interpreted their mandate as going well beyond the planning function visualized by the Board of Education. There was also hostility between the governing boards and professional school employees, eventually resulting in the transfer by the Ocean Hill board of a group of teachers out of the district and the lengthy teachers' strike of 1968. Intense emotion surrounded the conflict, and it came to symbolize a whole range of issues concerning the relationships between clients and public bureaucracies and between the races.

Throughout the school decentralization controversy the city administration played an indecisive role. No central office, either under the Board of Education or the Mayor, coordinated the decentralization effort. A research institute at Queens College provided the fledgling districts with what technical assistance they received. The Board of Education, although the nominal sponsor of the program, quickly lost control of it. The Mayor, while acting as an advocate of the program until the political consequences of doing so became too heavy, had no statutory power over an educational program. Many of the individuals associated with the experiment, including governing board members and some school personnel, believed that the programs could be meaningful only if their supporters were willing to confront the school bureaucracy directly.

In contrast, the ONG experiment was mounted with great caution. Its promoters, some of whom had been involved in the school dispute, devoted much attention to developing a program that would be politically viable. Thus, while many of them hoped to see considerable power transferred to community boards, their rhetoric concentrated primarily on administrative decentralization rather than community participation, and when they referred to participation it was in terms of democratic rather than race-conflict ideology. The program was set up so that the five experimental districts reported to a central Office of Neighborhood Government, which itself was directly under the Mayor. The Mayor issued a directive to the agencies under his control that ONG was vested with his authority. The director of the central office was diligent in keeping track of the activities of the neighborhood offices and selling the program to the various city bureaucracies. A key role was played by the local district managers who acted as intermediaries between neighborhood groups and the city service agencies. Some of the districts had community boards and others did not; in all cases the district manager worked actively to insure cooperation between community groups and the district service cabinet. He also worked especially hard to see that local elected officials did not regard ONG as usurping their role, and sought to provide staff services to these officials and give them credit for ONG activities.

A second important factor contributing to the nonthreatening nature of the ONG experiment was the composition of the district service cabinets. The establishment of cabinet structures enhanced the authority of district service chiefs, who while only occupying middling positions within their agencies, were at the top from the district perspective. Besides giving their egos a boost, the new structure permitted cabinet members to consult

[26] Edward C. Banfield and James Q. Wilson, *City Politics* (Cambridge: Harvard University and M.I.T. Press, 1963).

[27] A more extended analysis is provided in Susan S. Fainstein and Norman I. Fainstein, "From the Folks Who Brought You Ocean Hill-Brownsville," *New York Affairs* 2, No. 2 (1974), 104–115.

with their counterparts about district matters without going all the way up the agency hierarchy and back down again. As long as forces in the community were not viewed as hostile by the cabinet members, there was little reason for them not to welcome the new structure, and, in fact, of 82 cabinet members interviewed, 68 (83 percent) regarded the district cabinet as useful or very useful and only 4 members (5 per cent) evaluated it negatively.[28]

The fact that the cabinet bureaucrats were not seen as enemies by community leaders in the experimental districts results in part from the cautiousness of the ONG program in comparison with the far more ambitious school decentralization experiment. The rhetoric of some of the school decentralizers, including that of the Bundy Commission,[29] proclaimed that the educational system needed a thorough overhaul and that the experiments in community participation were a step in that direction. This overhaul was taken to mean major changes in the civil service rules which had long kept the administrative cadres of the system white and insulated from parental pressures. The goals of the school experiments thus were perceived as a direct threat by the administrative hierarchy and the teachers' and supervisors' unions, while the limited scope of the ONG experiment meant that it provided little threat to established interests.

Another important reason for the serenity surrounding ONG, however, was itself a product of the programs and activism of the 'sixties. One effect of strong pressures for bureaucratic change was minority-group recruitment to agency positions. Thus, 19 of the 82 district service cabinet members, or nearly a quarter, were nonwhite (only one was Puerto Rican). As a result, the client-bureaucratic cleavage was no longer so clearly reinforced by a minority-white division. Moreover, the presence of blacks on the cabinets created an ideological force within the bureaucracy supporting community control. This finding is particularly noteworthy since it indicates that blacks who "make it" maintain an ideological commitment different from their white peers (Table 11). The very high relationship between race and attitude toward community control among cabinet members (Gamma = .80) revealed in Table 11 is striking when compared with the relationship shown in Table 3 for community leaders, where Gamma ranges between .28 and .51.

Despite the presence of blacks on the service cabinets, and the preponderance of cabinet members of both races who support at least advisory powers for neighborhood groups, analysis of the cabinet interviews shows that the potential for racially polarized conflict between community activists and bureaucracies over local control has not disappeared. Further inspection of Table 11 indicates that the higher correlation between race and operational support for community control by cabinet members than by community leaders results almost entirely from the more negative attitudes toward community decision-making powers held by white cabinet members as compared with white community leaders. Only 18 per cent of white cabinet members favor decision-making powers for local boards, while above 40 per cent of white leaders favor local decision-making powers over at least some city services. Moreover, as Table 12 indicates, when the white group of cabinet members is examined by type of bureaucratic status, only 5 per cent of the 21 whites in the "hard services" support decision-making powers (just one black cabinet member held a position in the hard services). The implication of this finding is that intrusion by community groups into these service areas could well precipitate hostile reactions.

On the whole, the ONG experience suggests that the two citywide factors which most influence

Table 11. Relationship between Race and Support for Advisory versus Decision-making Power for Community Boards among Bureaucrats on District Service Cabinets

	Minority[a]	White
Favor Advisory Powers for Community Boards	33% (5)	82% (32)
Favor Decision-making Powers for Community Boards	67% (10)	18% (7)
	100% (15)[b]	100% (39)[c]

Gamma = .80

Chi-square = 11.92 with 1 df; *P* less than .001

[a] One Puerto Rican was included in this group.

[b] Fifteen of the 19 minority members interviewed responded to the probe concerning community boards.

[c] An additional 19 white members did not respond to the probe concerning community boards, and one white member opposed any form of community participation. While it is possible that the exclusion of 19 respondents may bias the results presented here, it is most likely that failure to answer points to a negative attitude toward community participation. In that case the table would understate the correlation between race and attitude.

[28] Fainstein and LaSpina, "District Service Cabinets and the Office of Neighborhood Government," part II.

[29] Mayor's Advisory Panel on Decentralization of the New York City Schools (Bundy Commission), *Reconnection for Learning* (New York: Praeger, 1967).

Table 12. Relationship between Service Area and Support for Advisory versus Decision-making Power for Community Boards among White[a] Bureaucrats on District Service Cabinets[b]

	Hard Services[c]	Soft Services[d]
Support Advisory Powers for Community Boards	95% (20)	66% (12)
Support Decision-making Powers for Community Boards	5% (1)	34% (6)
	100% (21)	100% (18)

P (Fisher's Exact) = .03

[a] There was only one black cabinet member in a hard service area.

[b] Nineteen white members did not respond to the probe concerning community boards, and one white member opposed any form of community participation.

[c] Hard services are sanitation, police, sewer, fire, water resources, traffic control, highway maintenance, and parks.

[d] Soft services are health, education, planning, human resources, aging, housing, youth, social services, welfare, drug addiction.

reactions to the introduction of decentralized governmental programs are the strategies followed by the program's sponsors and the responses of the affected bureaucrats. Community control could become an extremely divisive issue once again in New York if it is pressed as a redistributional program, particularly if it is interpreted as an attack on the still white-controlled hard service bureaucracies. In cities where racial integration of the service bureaucracies has proceeded less far than in New York, we would expect that programs for neighborhood participation, when neighborhoods are black and bureaucrats are white, would continue to produce interracial conflict.

National Factors. The policies of city governments will produce wide variations from place to place in the introduction of decentralized programs and the intensity of conflict surrounding them. The parameters, however, will be set by the national situation; urban conflict will be as much affected by federal programs and national currents concerning relations between the races as by particular events in any one city. Whether the federal government chooses revenue-sharing as its method of "returning government to the people" or reverts to the Johnson administration programs of maximum feasible participation will significantly influence not just the kinds of programs offered to city dwellers but also the extent of minority activism and white reaction.

The dismantling of the Office of Economic Opportunity (OEO), the demise of Model Cities, and the insistence that funding of organizations to benefit the poor must be channeled through regular governmental bodies have meant a decline in the resources available to ghetto residents in their battle against the status quo. Although few of these programs directly sponsored militant action,[30] they spawned militant leaders and raised the expectations of large numbers of people, thereby creating highly volatile situations. Reduced prospects of funding, a change in the national mood, and the routinization of organizations serving poor people have all served to reduce volatility. The strength of the counterattack following the urban disorders of the last decade made many black leaders wary of radical strategies. As a result, we have seen a nationwide decline in conflict organizations and militant rhetoric.

This decline, however, has not meant a return to the 1950s. There are a number of legacies of the previous era. Most important are the intermediate structures such as community planning boards, health boards, housing councils, block associations, and community corporations which arose in response to the urban programs of the 'sixties. These provided an arena for the development of a new cadre of civic leaders in areas of the city where, since the decline of the political machine, there had been almost a total absence of representative institutions. While the absolute number of participants in these structures is small and they lack authoritative power, such participants nonetheless act as attentive publics. The existence of a layer of even weak intermediate structures means some access, some patronage, and a reservoir of experienced individuals used to dealing with bureaucratic agencies.

A national Democratic administration would undoubtedly redirect attention toward the cities once again. Whether it would also foment the level of political activism which characterized the last period of Democratic ascendancy is an open question.[31] Fear of intense reaction by whites,

[30] See Fainstein and Fainstein, *Urban Political Movements*, pp. 31–36; Kenneth Clark and Jeanette Hopkins, *A Relevant War Against Poverty* (New York: Harper and Row, 1969), p. 65; James J. Vanecko, "Community Mobilization and Institutional Change: The Influence of the Community Action Program in Large Cities," in *Planned Social Intervention*, ed. Louis A. Zurcher (New York: Chandler, 1970), p. 270.

[31] Piven argues that coöptation of dissidents, increases in welfare spending, and the lessened political power of the cities vis-à-vis the suburbs all mean that the Democratic party in the future will not feel compelled to pay attention to the black urban masses. Frances Fox Piven, "The Urban Crisis: Who Got What, and Why?" in Cloward and Piven, *The Politics of Turmoil*, pp. 338–9. Her premise is that ghetto activism forced responses, rather than govern-

and realization that much of the earlier conflict was between deprived groups fighting with each other over limited resources, may make it less likely that minority leaders will again regard widespread mobilization as a useful strategy. J. Q. Wilson's prediction in *Negro Politics*[32] that black leadership would be primarily specialized and bureaucratically oriented is sustained, even though in 1968 it appeared outdated. Although the current dominance of the democratic type of community control ideology over the race-conflict type may diminish, the basis for a rapid shift is not at the moment obvious. Which of the two ideologies is more valid or would produce better tactics from the minority-group point of view is a different question.

As we have seen, within the broad type of the democratic model there is a split, correlated with race, over operational beliefs in community control. Blacks and Hispanics are continuing to push for community decision-making powers based on their position not so much as racial minorities but as a bureaucratic clientele. This pressure, combined with a recognition on the part of even conservative policy makers that too much centralization leads to rigidity and poor areal coordination, means that we will continue to see programs aimed at devolving authority to lower administrative levels and providing channels for citizen input into bureaucracies. These programs, however, have for the last six years been implemented without any large infusion of new resources. While they have created more flexibility and more responsiveness, as well as new neighborhood leaders and new bureaucrats whose social backgrounds more closely resemble those of their clients, they have not produced basic changes in the distribution of social benefits. Nor have they really had much effect on the dominant position of central bureaucratic authorities and unions of service providers.[33]

The various movements for community control and programs for decentralizing urban bureaucracies, then, have provided some new chips for the previously most disadvantaged players in the urban ecology of games.[34] Robert Dahl has commented that

> a central guiding thread of American constitutional development has been the evolution of a political system in which all the active and legitimate groups in the population can make themselves heard at some crucial stage in the process of decision.[35]

Decentralization and the creation of new linkage structures enlarge the number of groups participating in the policy-making process and increase the legitimacy and bargaining power of the relatively deprived. In other words, deprived minorities in many urban areas have now been absorbed into the pluralist bargaining system. Where once their impact on the political marketplace was no more substantial than that of the impoverished consumer on the economic one, they may now participate on a level analogous to the individual with some money to spend but little to invest. The predictable result is compromise, an occasional gain, but no major redistribution across social classes.[36]

The game, moreover, is limited to the municipal level. The greater power of racial minorities to control garbage collections or allocations in the city budget is not reflected in a commensurate ability to influence national priorities. In an era of rapid inflation and high unemployment, achievements at the local level often seem insignificant and diversionary, although there is no compelling logic to show that the energy spent on local causes could be easily redirected to more general issues.

The question of whether community control is a useful strategy for minority groups has been much debated.[37] Its general endorsement by whites as well as blacks, the lessening of its identification as a specifically black cause, despite the willingness of minorities to carry its implementation farther than most whites would, and its framing in democratic rather than group conflict terms, tend to validate the criticism by radicals that it is a moderate and coöptative strategy. Whether to sacrifice the limited but tangible gains that it

ment programs creating activism, as Moynihan has argued. Daniel Patrick Moynihan, *Maximum Feasible Misunderstanding* (New York: Free Press, 1969), pp. 134–5. An alternative view is that the two factors, programs for the poor and activism by the poor, are interactive and intensify each other, even while coöptative tendencies are also at work. Fainstein and Fainstein, pp. 231–3.

We provide a policy-oriented analysis in Susan S. Fainstein and Norman I. Fainstein, "Local Control as Social Reform: Planning for Big Cities in the Seventies," *Journal of the American Institute of Planners* (July 1976), 275–285.

brings in the hopes of larger redistributive goals is tied up with a number of political and normative judgments. These concern the possibility of radical black-white coalition, the virulence of majority reaction to militant strategies, the capacity of minority groups to constitute a revolutionary class, and the superiority of a direct system of income redistribution to one of service provision. The continued predominance among minority and white urban leaders of an ideology of community control based on the democratic model indicates a general acceptance on their part of the inevitability, although not necessarily the desirability, of the pluralist model of urban politics.

COMMUNICATIONS

What Gordon Tullock Really Said

TO THE EDITOR:

Now that there is a citation index for the social sciences, every footnote citation can be depended upon to increase the real wealth of a scholar. Under the circumstances, I am happy to be cited in the Arcelus and Meltzer article.[1] Unfortunately, what Arcelus and Meltzer say I said is almost the exact opposite of what I really did say.[2]

I suspect that Arcelus and Meltzer in fact depended on Riker and Ordeshook.[3] Riker and Ordeshook were working not from the final text of my book, but from a very early draft. Further, so far as I can see, they had somewhat imperfect memories of what was in even this early draft. However, because of the wide circulation their joint textbook has achieved, this particular misinterpretation of my views is becoming a widely cited part of my "works."

I should not like to close this comment without saying that this particular slip on the part of Arcelus, Meltzer, Riker, and Ordeshook does not, in my view, detract from the general excellence of their work. Indeed, I have used *An Introduction to Positive Political Theory* in teaching and intend to continue using it. But even Homer nods.

GORDON TULLOCK
Virginia Polytechnic Institute & State University

[1] "Tullock, p. 110–114, argues that in a typical election, there are many voters so P is small and R is negative. He concludes that voting is irrational. Riker and Ordeshook, p. 28–34 respond that P depends on the closeness of the election, not just the number of voters and also add D to the equation." Francisco Arcelus and Allan H. Meltzer, "The Effect of Aggregate Economic Variables on Congressional Elections," *APSR*, 69 (December, 1975), fn. 11, p. 1233.

[2] "The equation, if it is thought to be in any way descriptive of the real world, would imply that people would be more likely to vote in close elections, . . . since D would be larger . . . . The . . . hypothesis was tested by Riker and Ordeshook and found to be correct." Gordon Tullock, *Toward a Mathematics of Politics* (Ann Arbor: University of Michigan Press, 1967), pp. 110–11.

Whom Did Wallace Hurt in 1968?

TO THE EDITOR:

The possibility of a Wallace-As-Independent candidacy in 1976 raises anew the question of the effect of his candidacy on the 1968 election.

A great deal has been written about the roots of the Wallace vote and about the Wallace sympathizers who nevertheless voted for a major party candidate (see: Lipset and Raab, *The Politics of Unreason* [New York: Harper and Row, 1970], 338–427). But Wallaceites who remained hidden cannot have figured in Wallace's effect on the outcome in 1968. Wallace's impact must be measured by discussing actual Wallace voters and by figuring out how much the outcome would have differed if he had not run against Humphrey and Nixon.

If Wallace voters had strictly followed their ordinary party preferences, it would have been unambiguous that Humphrey paid the heavier price for the Wallace candidacy. Consider the data in Table 1.

But of course voters do not strictly follow partisanship, and knowledge of party identification will not help us predict the votes of "independents." According to Brody and Page ("Indifference, Alienation and Rational Decision," *Public Choice*, 15 [1973], 1–17) and Kelley and Mirer ("The Simple Act of Voting," *American Political Science Review*, 68 [June 1974], 572–591), voters appear to follow relatively simple decision rules. By using these rules we can examine the distribution of expected votes of those who voted for Wallace in 1968 under the counterfactual condition of no Wallace candidacy.

These decision rules are: (1)—Voters who say they favor[1] one candidate more than another are very likely—on the order of 95 per cent—to vote for their favored candidate. This rule holds regardless of how much they favor their favorite or even whether their most favored candidate is rated unfavorably. Americans appear to distinguish the lesser of two evils or the greater of two goods and vote accordingly. (2) Voters who are neutral or indifferent toward the candidates, i.e., those voters who give the candidates the same favorability rating, tend to vote for the candidate of their party.

Applying these rules to Wallace voters in 1968 we find that Humphrey was hurt more by Wallace's candidacy than Nixon was. But the disadvantage is not nearly as marked as the distribution of Wallace voters' partisanship would lead us to expect. Combining the two samples, the joint distribution on the two decision rules is shown in Table 2.

These data lead us to conclude that absent the Wallace candidacy, 55 per cent of the Wallace voters would have voted for Humphrey, 42 per

[1] Favorability is measured here by candidate "thermometer" ratings in the SRC sample and by a Likert scale in the ORC sample. Previous studies have shown that the two formats yield identical results as far as the decision rules are concerned.

Table 1

	Party Identification[a]			
	Democrat	Independent	Republican	N^b
Wallace Voters	58.5%	17.4%	24.1%	195
Rest of Sample	56.6	9.2	34.1	2211

[a] "Leaners" are grouped with their fellow partisans.
[b] Data are combined from the SRC/CPS, 1968 postelection survey ($N=1384$) and a postelection survey carried out by Opinion Research Corporation for the Stanford based Issues in an Election Project ($N=1153$).

Table 2

Balance of Favorability Judgment		Party Identification: Democrat	Independent	Republican	Column: N	Column: %
Pro-Humphrey		30[a]	19	24	73	37.4
Neutral		34	6	2	42	21.5
Pro-Nixon		50	9	21	80	41.0
	Row N	114	34	47	195	
	%	58.5	17.4	24.1		

[a] Entries are the number of Wallace voters satisfying the combination of conditions under the decision rules.

Table 3

Southern Region Balance of Favorability Judgment		Party Identification: Democrat	Independent	Republican	Column: N	Column: %
Pro-Humphrey		24	12	15	51	43.2
Neutral		19	1	1	21	17.8
Pro-Nixon		33	5	8	46	39.0
	Row N	76	18	24	118	
	%	64.4	15.3	20.3		

Non-Southern Region Balance of Favorability Judgment		Party Identification: Democrat	Independent	Republican	Column: N	Column: %
Pro-Humphrey		6	7	9	22	28.6
Neutral		15	5	1	21	27.3
Pro-Nixon		17	4	13	34	44.2
	Row N	38	16	23	77	
	%	49.3	20.8	29.9		

cent would have supported Nixon, and the remaining three per cent (the six "Neutral-Independents") would probably have abstained.

A coarse regional breakdown indicates that Humphrey was seriously affected by the Wallace candidacy only in the South. See Table 3.

These data yield the following distribution of expected votes:

Expected Vote	South	Non-South
Humphrey	59.3%	48.1%
Nixon	39.8	45.5
Non-Vote	0.8	6.5

These survey data will not permit us to examine the effect that Wallace's absence from the ballot would have had on the electoral vote.[2] But nationwide, the distribution of Wallace voters in accord with the decision rules would have affected the balance of the two-party popular vote very little. Instead of Humphrey's receiving 49% of the two-party vote in these combined samples, if the Wallace vote divided as expected, Humphrey would have received 49.85% of the two-party vote. Perhaps this change would have increased the suspense of an already tense election eve, but surely little else would have followed from the one and one-half per cent shift in the popular vote that is our best estimate of the effect of "No Wallace" in 1968.

RICHARD A. BRODY
Stanford University

[2] If we were willing to assume that the observed distribution of "second preferences" held throughout the region, in the South, Humphrey would have had popular majorities in all five of the states that Wallace carried in 1968 (including Georgia and Arkansas where Humphrey ran third). In the six southern states that Nixon carried, however, a combination of Wallace weakness and Nixon strength means that Humphrey would not have gained a majority of the popular vote in any of these six states. In the 26 states outside of the South that Nixon carried, Humphrey's slight lead as "second preference" to Wallace, would not have helped him at all. Even in Ohio, Missouri and New Jersey, (where distribution of the Wallace vote in accord with the division for the entire non-southern region gives Humphrey his greatest boost, he falls short of the requisite majority. Thus under the assumption of uniform distribution, Humphrey gains all of Wallace's 45 electoral votes but still comes up short in the final tally.

The States' Role in Public Policy: A Clarification

TO THE EDITOR:

In December, 1973, I presented three tables measuring the state share of the national variance in a *Review* article.[1] Since these tables have been a source of repeated misinterpretation and misuse, I would like to clarify their purpose with an example and to summarize why they cannot be used to evaluate the states' role in public policy.

[1] Douglas D. Rose, "National and Local Forces in State Politics: The Implications of Multi-Level Policy Analysis," *American Political Science Review*, 67 (December, 1973), Tables 1, 2 and 3.

At the time I wrote the article, researchers in state politics characteristically were basing their conclusions on methods which could not distinguish among three crucially different situations. In the first situation, which researchers usually assumed to be the actual state of affairs, state governments each made and implemented policy on the basis of what was possible and desirable for their state. Though states operated completely independently, they happened to follow a common pattern in their policy decision making, so we could discover the empirical laws describing state policy making by comparing states on their "inputs" and "outputs." The empirical law would be the rule linking resources and policy.

In the second situation, some national policy maker such as the federal government made policies, after considering what was possible and desirable, and applied them to individuals everywhere in the country; the policy resulted from a rule which linked an individual's resources to his policy benefits, so that we could discover the rule by comparing individuals on their resources and policy benefits. In the third situation, several levels of government made rules which all affected the policy; by examining the relationship of resources to policy benefits for states, we could only discover the net rule, not the separate rules at each level.

Researchers have three ways of knowing which of these situations is occurring: we can know who actually makes policy decisions, we can know what the different decisions would be if different actors made the decisions, and we can know the different patterns of variance at the individual level which would result from the different situations. Using any of these requires attention to more than one level of analysis; when researchers confined their data to the state level, they could not know which situation existed.

A Simplified Illustration. The Aid to Families with Dependent Children (AFDC) program illustrates the problem. Consider for illustrative purposes that the program rules describe a broad-gauge welfare program not limited to families with dependent children. It is a federal program: the federal government sets up the program, provides the basic money, and sets the basic rule, the famous "thirty and one-third" rule. Again, let us simplify the rule to the following:

(1) no welfare is received by an individual unless his income (I) falls below some standard (A);

(2) the amount of welfare received (W) is proportional (.67) to the difference between income and the standard.

In addition to being a federal program, AFDC is a state program; states implement the program with some discretion and can modify the basic rule somewhat (in the guarantee level, setting a maximum payment, treatment of child care, etc.). Thus we have two levels, federal and state, operating with different rules.

Let us ignore the impact of the program (redistribution of income toward equality) and just concentrate on describing the policy. The federal input into policy follows the rule and the distribution of income in the population. Measure the income distribution with two variables, a dummy variable R, designating whether a case is rich or poor by whether the case is above or below the standard income, and a graduated variable I, applicable only to the poor, describing income in dollars. The federal variance in welfare payments (W) is a function of the rule and the variance of these two income distribution measures. Statistically, the federal variance is

$$(.67)^2(A - \bar{I})^2\bar{R}(1 - \bar{R}) + \bar{R}\frac{\sum_{i=1}^{N_r} .67^2(I_i - \bar{I})^2}{N_r}$$

In words, the federal input in welfare variance is (1) the mean payment squared times the variance in poverty (recipients), plus (2) the mean poverty (recipients) times the variance of payments among the poor (recipients). If these welfare payments were regressed against the income distribution measures, we would conclude that the rule (regression coefficients) was: rich people get no welfare, poor people get two-thirds the difference between their income and some constant (standard) A. We would be correct.

Though, as described so far, the policy decisions have nothing to do with the states in actuality, the federal input into welfare will result in state differences in welfare payments if the states differ on income. The federal rule will translate income differences among individuals into welfare differences among individuals; if poor individuals tend to cluster in some states, then those states will get more welfare payments. Specifically, the between state income variances will translate into between state welfare variances by exactly the same formula (reflecting exactly the same federal rule) as do individual level variances. While the relationship at the state level is spurious, it will show a perfect correlation between income and welfare. If we looked at only the between state variances, we could deduce the payment rule from a regression analysis, but we could not know that it was a federal rule. Instead, we would be likely to conclude that states decided welfare payments, that the states' decisions were determined solely by economic considerations, and that poor states were making a greater "welfare effort" than were rich states. All these conclusions would be false.

Now consider an actual state input into welfare policy. Suppose states have to come up with some matching funds. States with many poor people will not have much of a tax base from which to collect the funds; so, let us assume, they come up short on matching funds, so people in their state will receive fewer federal funds than they otherwise would. For simplicity's sake, assume that the adjustment takes the form of reducing the payments; rich states do the opposite. State input into welfare policy thus adjusts the federal "two-thirds" rule by the proportion of a state's citizens who are poor ($\bar{R} - \bar{R}_s$). The net effect of these state adjustments is to decrease the between-state share of the welfare variance, as states are moving toward a common welfare payment per capita score despite the differences in poverty between their citizens. Suppose we now regressed between-state welfare variance on between-state income distribution variance; we would not come up with the federal and state rules separately but in confusing combinations. The deduced rule would be: (1) rich people get nothing, (2) poor people get $(.67 - \bar{R})$ times the difference between the standard and their income. Since in any particular analysis, $\bar{R}$ is a constant (.11 for instance), the only difference in results between the federal and federal-plus-state situations would be in the size of the coefficient, so the analyst would need to know the federal rule in order to understand that his results reflected the operation of two levels. As long as the analysis is confined to state level data and knowledge, the results do not give any clues to who is making what decisions.

If we look at both state- and individual-level data, we can deduce a great deal about the levels operating. The fact that the between state share of the variance on both input and output variances is more than zero and less than one indicates that two levels might be operating. The main clue lies not in examining income and welfare separately, however, but in comparing them. As the example has been given, if *only* the federal level is operating, the state share of the variance on income and welfare payments would be the same; with two levels operating, the state share of the variance on welfare will be much lower than the state share of the variance on income. It would be immediately obvious that two levels operate with two different rules. State characteristics on the aggregate would obviously be affecting policy at the individual level. Also, it would be obvious that while the

national rule was to translate income differences into welfare differences, the state input was, to the contrary, to negate these economic considerations and move all states toward a similar welfare payment per capita. In the original article, the illustrative results here were the characteristic results found empirically. The problem was real. States were only one of several levels making policy, and the state input into policy reduced the role of socioeconomic considerations, thereby producing highly similar policies in the states.

Legitimate and Illegitimate Uses of the State Share of the Variance. The comparison of shares of the variance on social and on policy variables indicated that state policies were in fact often the reverse of what we had thought and that we could not even measure state policies unless we considered the context within which they occurred. The intended effect was to encourage the study of states within a national and federal governmental context. To some degree this has been happening.

Just as frequently, the tables have been misused by being interpreted as summary measures of the importance of states in American politics. This misinterpretation ignores three aspects of the tables: (1) no reasonable standard of importance exists for the measure; (2) impacts which are common across states are not measured; and (3) policies which are redistributive within states are not measured. The problem of a standard of importance is normative and causal as well as statistical. On social variables such as sex, we do not expect governments to account for all the variance in the population; it is not clear that it is even possible for half the states to be all male and half all female as a permanent arrangement; I doubt that many would consider this a desirable distribution, and even fewer of us would consider it desirable for governments to mandate the arrangement. While the 100 per cent of the variance standard is important statistically in understanding what governments do, it is not a reasonable standard of the importance of governments. Standards of lesser magnitude, e.g., 50 per cent of the variance, appear to be equally unjustified without specific elaboration.

Similar problems obtain for politics and policy: Is it really possible or desirable to have all voters or all Democrats in a few states? Are states unimportant for policies when they lack a monopoly or, as in the electoral college, does their importance increase with internal diversity? If divorces only occur in Nevada, only Colorado allows abortion, or only New York regulates water use in summertime, does the variance accounted for make states more or less important than if policies and policy impacts are spread more widely within and among states? The lack of a reasonable standard is tied to the second problem: when states have similar policies, societies and impacts, the states do not account for much variance, yet the consequences within any state are not diminished merely because other states display similar characteristics. As many authors—Walker, Munger, Gray, Menzel, Eyestone, etc.—have indicated, similar policies often exist in the states. Yet both the causes and the consequences of the policies are important; as I have demonstrated, the similarity in policy often masks independent processes occurring within each state. Variance, by definition, deals only with what varies; when the important state policies are similar across states, variance does not measure the important policies. Finally, some of the most important policies of governments are not public goods shared by all citizens (and thus reflected in averages across individuals) but instead are redistributions among citizens, which may be zero-sum (and thus not all are reflected in averages across individuals) and are reflected directly only by measuring variance within a state. Prior to the 1965 Voting Rights Act, many Southern states redistributed voting power away from blacks and toward whites; surely this policy was not important merely to the degree that it lowered the overall turnout rate—yet that is the only aspect of the policy which shows up in between-state variance. While states do not at present appear to engage in redistributions of equivalent magnitude,[2] the problem cannot even be examined by relying on between state variance (without special transformations, a la Fry and Winters). The state share of the national variance thus simply does not measure potentially important state impacts which are redistributive or common across states, and of the impacts measured there is no standard of importance which is reasonable in normative or causal terms which could be used to evaluate states.

One of the main purposes of the tables was to indicate the inadequacy of treating variance of single variables as an adequate basis for studying states. It is therefore somewhat ironic that I now have to argue that the same variance figure on the same single variables (this time divided by the national variance) is neither an adequate basis for refusing to study states nor an adequate justification for restricting the study of states to case studies and global variables "unaffected" by the national society or individual level behavior. As students of American national government occasionally discover, states cannot simply be ignored;

[2] For an examination of state redistributive effects, see my "Comment: The American States' Impact on Voter Turnout," *American Political Science Review*, 69 (March, 1975), 124–131.

the complexities involved in studying them cannot be vanquished by letters to the editor.

Issue Areas and Differentials in Bureaucratic Power

TO THE EDITOR

As a student of state politics and bureaucratic policy making, and further, as one who learned that sometimes esoteric trade working with and for Professor Jack L Walker, I read "Variations in Elite Perceptions of American States as Referents for Public Policy Making" (Fred Grupp and Alan Richards, Sept. 1975, pp. 850–858) with the keenest of interest. To anyone who regularly reads the section of the *Review* titled Communications this will sound as hollow as it does obligatory, but I found the article to be stimulating, informative, and quite well done. I have already made classroom use of its Table 1, and I must confess that much of the *Review* does not find its way into my daily teaching performance. Still, I do have a complaint to register.

Grupp and Richards offer, and substantiate, the hypothesis that "the greater the inequality of esteem in a policy area, the greater the influence of administrators in that policy area" (p. 856). I have no quarrel with the hypothesis itself; indeed I am quite convinced they are right. My problem arises when they begin to tell us *why* they are right. In their conclusion they offer the following explanation for the observed relationship between consensus on quality state programs and administrative influence. In their own words, ". . . executives in those policy areas characterized by high levels of consensus about the better state programs have their influence increased because they are able to approach legislators or the governor's staff with specific policy proposals which are known to be working well in those highly esteemed states. This advantage does not accrue to executives in policy areas where there are no acknowledged leaders" (p. 858).

I find several objections to this path of explanation. First, does it not assume that the administrators are aware of whether or not consensus exists within their own field about who is "the best"? If knowledge of that consensus were not assumed, then why would the bureaucrat who saw in Maine the country's best welfare program feel he or she has "less to offer the other policy makers" (p. 856) than any of the 30 public works officials who felt California was the nation's leader in that area? Yet so far as I can tell from their article, Grupp and Richards asked each administrator to name the state he or she felt had the best program. They did not ask whether this was a view these administrators felt was shared by similar professionals in other states. I am not convinced that we can infer from Grupp and Richard's work, or even from Walker's earlier efforts, that these officials are really aware of the level of consensus on program quality that exists in their area of specialization. Until we can be sure of their awareness of that consensus (or its lack) I do not see how we can conclude that such an awareness influences the perceptions of program administrators of their influence in the policy process.

Perhaps even more important, the Grupp and Richards explanation assumes that politicians (governors, their staffs, and members of the legislature) are also aware of the extent of program quality consensus within the various policy areas and that politicians and bureaucrats tend to agree on who runs the "best show in town." If such an assumption is not being made, then what makes the public works official's argument that it works in California more persuasive than the welfare officer's statement that it was successful in Nevada or Vermont? Until we actually ask them, can we assume that governors and legislators are aware of bureaucratic perceptions of program quality, or that the assessments made by these political officials as to who runs the best program in a particular policy area will parallel the judgments made by administrators in that same area?

Finally, even if administrators are aware of "inequality of esteem" within their own policy areas, on what grounds do we assume that the administrator who perceived West Virginia as the nation's welfare leader would feel he or she "has less to offer" than one of the "gang" who saw California as "top dog" in public works? As one who has been close to the training of welfare professionals I can imagine no group more likely to believe in the validity of its proposed solutions. It seems to me that West Virginia's secret admirer, like Maine's, Vermont's, or Oklahoma's may well feel that he or she can "provide a proven solution to the problem"; the question is whether or not that solution will be accepted, and that is a question that goes far beyond the administrator's conviction that the solution proposed is workable.

Still, as I said at the beginning, I cheerfully accept the hypothesis that administrators will feel more influential (and probably be more influential) in policy areas characterized by considerable agreement on program quality. The reason I can accept it is simple: both program quality consensus and administrators' perceptions of their influence are reflections of a third variable, the nature of the policy area in question. If it is an area like welfare or business regulation that has long been a political battleground and affects deeply felt American values there is likely to be

little consensus, even among program administrators, on the "right" course to follow. Similarly, since these issues have intruded themselves into past races for the governnorship and the state legislature, and may be expected to do so again in the future, politicians are going to be reluctant to delegate their resolution to a set of officials who will not have to face the voters come November. Presumably, experienced bureaucrats will sense this attitude and adjust their perceptions of their own influence accordingly. On the other hand, executives in far less controversial areas like public works or public health administration (excluding the potentially explosive Medicaid program) would seem in a better position to arrive at some internal professional agreement on program quality and would face politicians far less concerned about exercising control over the final shape of policy outcomes. Once again, the bureaucratic executive will perceive this lessened concern and adjust his or her perceptions of agency influence on these policy decisions.

In addition to the differences in the level of political conflict surrounding various policy areas, some policy questions, on their surface, appear to require more expert knowledge for their solution than do others. In other words, some things just look more complicated than others. The governor and his or her staff almost certainly view the expertise of a public health epidemiologist talking about immunization programs in a very different light than they would view the expertise of a welfare administrator discussing eligibility requirements for AFDC. Though not unrelated to differences in the level of political conflict, this probably reflects an even deeper cultural perception about the nature of expert knowledge, as well as the need to use it. I can only speculate about why, but there are some areas of public policy in which the value placed on specialized knowledge is high and other areas in which it is low, and I suspect that bureaucrats soon become aware of which kind of area they are operating in and adjust their perceptions of their own influence on policy decisions accordingly. Our welfare bureaucrat enamored of Maine's excellence probably feels he or she can "provide a proven solution" but knows from years of trying that the political controversy surrounding welfare, as well as the politician's habit of downplaying the potential contribution of a welfare executive's expertise, will affect that politician's response to that "proven solution." It seems safe to conclude that administrators would take that realization into account when assessing their agencies' political influence. A public health administrator who knows that he or she works in a less controversial area and that specialized knowledge is seen as essential in that field will have far greater confidence about the agency's ability to influence policy choices.

If others agree with this objection to Grupp and Richards, as well as with my conviction that they have produced a truly important article, perhaps we will have a real world example of that always hoped for but ever elusive "building on one another's work" that is supposed to be the essence of a scholarly community.

DENNIS D. RILEY
University of Minnesota, Duluth

TO THE EDITOR:

We find Professor Riley's comments reasonable, even plausible. Our discussion (p. 855) of differences in policy areas is similar to the points he raises—i.e., we are aware that some policy areas, such as welfare, are controversial and that the expertise employed in some areas, such as public health, is apt to be accorded great respect by political leaders. We chose not to highlight these assertions in our concluding remarks because they remain suppositions; our findings were made within Walker's theoretical context.

Further, we are more impressed than Professor Riley with the capacity of the national, professional associations of state officials (p. 851) to inform the executive and legislative branches of state government of programs and policies which are working well in other states. It would be revealing to see how many persons serving on the staff of the governor, in the Legislative Reference Service, or in the state legislature regularly attend the meetings of these professional organizations and receive their newsletters or other publications. Should there be considerable interaction between the professional associations and these policy makers, our explanation of our findings would receive additional support.

We believe the issue is still open. Professor Riley's stimulating comments are, in our view, not an example of "building on another's work," but rather a call to further research. We did write that the state executives' "ability to influence policy outcomes varies by policy area, within as yet uncharted limits" (p. 858).

Finally, we are very pleased that he found our article useful in the classroom.

Critical Elections and the Supreme Court: Putting the Cart after the Horse

TO THE EDITOR:

In recent years, political scientists have increasingly come to appreciate the impact of realign-

ments of the American electorate on the making of public policy. A recent article by Richard Funston, "The Supreme Court and Critical Elections," *APSR*, 69 (September, 1975), 793–811, extends consideration of this mass-elite linkage to the actions of the Court in declaring national legislation unconstitutional. Funston is to be commended for attempting to explain Supreme Court behavior in terms of factors external to the Court itself, for the clarity of his exposition, and for his compelling assessment of the role of the Supreme Court in American politics. Yet, the principal theory which he advances remains untested. We cannot determine from his study what impact electoral realignments (in producing new legislative majorities) have had on the activities of the Supreme Court.

Funston has theorized that the Supreme Court is significantly more likely to declare laws unconstitutional when it remains the last bastion for the (old) national majority recently vanquished in realignment. This theory seems quite straightforward: During a period of realignment, one legislative majority is replaced by another. Later, after presidential appointments have changed the composition of the Court, the Court comes to reflect that same national majority. In the interim, when the Court reflects the vanquished majority, it confronts the new majority directly by declaring acts of that majority unconstitutional.

In his empirical analysis, Funston provides us with three different tests of his theory—concluding that each provides strong support for it. (1) He compares Court actions (i.e., striking down national legislation as unconstitutional) during the periods in which realignments took place with Court actions during the remaining non-realignment years. (2) He compares Court actions during "the total years of partisan realignment phases plus the total number of years necessary for a fifth or majority appointment to be made to the Court *after the beginning* of each of the realignment phases" with those in the remaining years. (3) He compares Court actions during "the total years of partisan realignment phases plus the total number of years necessary for a fifth or majority appointment to be made to the Court *after the end* of each of the realignment phases" with those in the remaining years. In each of these tests, the years in which he expects the Supreme Court to oppose the new majority include the eight-year period during which Funston contends that the realignment itself was taking place: 1820–1828, 1852–1860, 1888–1896, and 1928–1936.

None of these comparisons provides an adequate test for the theory Funston has advanced. The problem is that, by using the years in which the realignment is taking place, Funston has included many years in which the "emerging majority" had not yet become a legislative majority. The Jacksonian Democrats did not take power fully until 1829, Republican control began in 1861 and was later reasserted in 1897, and the Democrats did not become a legislative majority (i.e., control both Congress and the President) until 1933. In fact, of the 36 years in Funston's realignment phases, the Supreme Court "confronted" the old majority in exactly half and the new majority in only six (four during the New Deal period)! When we include laws declared unconstitutional which are at most four years old, the number of cases in which "old majorities" on the Court have overturned "old majorities" elsewhere may well increase.

No test of the Funston theory is adequate which includes these "realigning phase" years. Instead, attention should be focused on the first years after the realignment has been consummated by the installation of a new legislative majority—but before that "new majority" has been able to alter the basic composition of the Supreme Court. Thus, Funston at least should have studied the behavior of the Court from 1829 to 1836, 1861 to 1864, 1897 to 1909, and 1933 to 1940—in each case, the period from the new majority's seizure of control of both Congress and the Presidency to the appointment of a Court majority by "new majority" Presidents. To be even more precise, Funston should have taken into account the possibility that the "new majority" already had allies on the Court—i.e., McKinley "inherited" a Court in 1897 in which only three justices had been appointed by Democratic presidents. Finally, in order to be certain that old and new majorities are confronting one another, Funston should also examine the background of each case individually (there are not so many that the task is oppressive) instead of including all those in which the Court has negated laws four years old or less.

That Funston's theory has been supported with inadequate tests is not as puzzling as it may seem at first glance. A majority of the decisions to declare national legislation unconstitutional were rendered during the New Deal realignment phase. During the last four years of this period, a new majority was ensconced in Congress and the White House and faced a hostile Supreme Court. The confrontations between the Court and the more popular branches of government during this period alone may have produced the overall relationship. Thus, in order to demonstrate that a more enduring pattern of institutional conflict has been identified, a separate table for the non–New Deal periods should be provided.

The fact of the matter is that the observation made in the previous paragraph and Funston's are little more than speculation without the proper empirical tests. Funston should make these tests and report his results to the profession. His theory

is too interesting and too important for our understanding of policy consequences from realignments to leave the matter unresolved.

PAUL ALLEN BECK
University of Pittsburgh

TO THE EDITOR:

I think Professor Beck's criticisms very well taken. Indeed, they reflect certain caveats which I myself noted in my article. While his reservations about the analysis are appropriate, however, the vigor with which he presses them suggests that he has, in part, missed the point of the essay.

After three paragraphs which reasonably accurately summarize "The Supreme Court and Critical Elections," Professor Beck's central point (italicized, lest the unwary reader miss it) is made at the beginning of his fourth paragraph. I agree with that point. But I fail to see how it materially adds anything to what I wrote (p. 807):

> . . . The use here of some years before the elections which brought new coalitions to power as part of the realignment phases may very probably have artificially deflated the indexes for the critical periods. . . . Perhaps future research might attempt to determine the year of the ascendancy of the new coalition. . . . Such attempts to determine precise years of ascendancy, however, not only must contend with the scholarly contentiousness about which elections actually involved realignments but also will be liable to the charge that they have defined the critical periods so as to inflate the statistical results. . . . If the results reported here can be achieved by using realignment phases not inherently favorable to the thesis, they may perhaps be considered to be even more persuasive.

As for Beck's remarks concerning the New Deal period, I would simply refer him to my footnote 67.

"The Supreme Court and Critical Elections" was intended—and, I think, can and should so be read—as a synthetic rather than an original analytic effort. It was an attempt, as I stated in several places, to both integrate and test the assertions of certain leaders in our profession—most notably Dahl, but also Burnham—*on their own terms*. This effort at replication was dictated by my belief that we social scientists too little attempt to build upon one another's work as do our brethren in the natural sciences.

I could not more agree with Professor Beck that such an integrative statement as is represented by my article is but the beginning not the end of analysis, and I very much concur in his judgment that such an analysis must "examine the background of each case individually." I said as much in the article (p. 808):

> Ultimately, the subject calls for an extended, systematic, historical examination of the Court's decision making explicitly based upon the electoral classification scheme devised by the S.R.C. and elaborated by others, a treatment of the Court similar to that which Chambers and Burnham have done for the parties. . . . Any study such as this, based upon aggregate data, necessarily sacrifices situational focus for numerological standardization; but Supreme Court decisions are not fungible goods.

Indeed, my conception of what is required is apparently much more ambitious than Beck's; I think we need nothing less than a definitive intellectual history of the Court; something we do not now have. (See also my note 84.) I am encouraged that someone with Professor Beck's analytic skills also thinks the pursuit important.

RICHARD FUNSTON
San Diego State University

Alliance Behavior in Nineteenth-Century Europe

TO THE EDITOR:

In their recent analysis of nineteenth-century European alliance activity, McGowan and Rood allude to two separate dimensions of alliance aggregation—spatial and temporal. "If these [Kaplan's] rules are violated, either by a rigid enmity, such as existed between France and Germany after the annexation of Alsace Lorraine [spatial], or by a decline in the system alliance formation rate [temporal], then a loss of system flexibility will result and system-changing events are likely."[1]

Despite their repeated assertions that independence and flexibility in the matter of "whom the alliance partners are"[2] are vital to the maintenance of a balance of power system and their quoting Kaplan in the same vein ("the 'balance of power' system postulates that any alignment is as probable as any other alignment prior to a consideration of the specific interests which divide nations. Moreover, any particular alignment should not predispose the same nations to align themselves with each other at the next opportunity"),[3] the authors go on to ignore the spatial dimension of alliance aggregation in their data analysis. They test, instead, three hypotheses which concern the times at which alliances in nineteenth-century Europe were formed. These are

> H1: in a balance of power international system, the occurrence of alliances will be stochastically distributed (the number of alliances formed per unit of time is a Poisson random variable), and
>
> H2: in a balance of power international system, the time intervals between alliances are randomly distributed (the distribution of interalliance intervals is a negative exponential random variable).[4]

[1] Patrick J. McGowan and Robert M. Rood, "Alliance Behavior in Balance of Power Systems: Applying a Poisson Model to Nineteenth-Century Europe," *American Political Science Review*, 69 (September 1975), 862.

[2] *Ibid.*, p. 861.

[3] *Ibid.*

[4] *Ibid.*

and

H3: in a balance of power international system, a decline in the systemic rate of alliance formation precedes system changing events, such as general war.[5]

Past scholarship, however, hardly agrees with McGowan and Rood that the time at which alliances are formed is the most important aspect of their relation to the operation of balance of power systems. Edward Gulick's account of European alliances is generally accepted as a classic account of the operation of a balance of power system (Robert Jervis's observation that Gulick's subject matter is more properly to be considered a "concert system" notwithstanding). In citing an example of the requisite (especially for the "holder of the balance") "mobility of action" for the maintenance of a balance of power system,[6] he emphasizes the identities of allies and opponents at least as much as, if not indeed more than, the times at which the alliances were concluded. Richard Rosecrance argues that

the balancing system of Europe required states to ally or oppose each other according to the presumed distribution of power: if ideological bonds or animosities had arisen, states could no longer have charted their courses on power considerations alone; states would have refused to balance against their ideological *confreres* or to align themselves with ideological opponents, regardless of the configuration of power.[7]

Dina Zinnes assumes the importance of spatial flexibility when she constructs her analytic model of a "hypothetical world" of possible alliance combinations in such a way that "the labels of the nations are unimportant. The relevant factors are the number of alliances of various sizes and the placing and number of power equalities and inequalities."[8] Nicholas Spykman offers simply that "he who plays the balance of power can have no permanent friends. His devotion can be to no specific state but only to balanced power. The ally of today is the enemy of tomorrow. One of the charms of power politics is that it offers no opportunity to grow weary of one's friends."[9]

It seems likely, then, that if threats to a very polarized (spatially nonrandom) system occur randomly (or according to a Poisson distribution), causing alliance formation within the system, most students of the balance of power "theory" would say that the system itself is neither fluid nor flexible (i.e., it would be a rigid system responding to random stimuli). On the other hand, a system of spatially random alliances would usually be considered fluid and flexible whether it was responding to random or nonrandom (temporally) stimuli. Therefore, the more important of the two dimensions of alliance aggregation would seem to be the spatial one.

Although McGowan and Rood have given us an excellent analysis of the temporal randomness of nineteenth-century alliances in Europe, it would be far more interesting and important to know whether these same temporally Poisson-distributed alliances exhibit spatial randomness as well. If they do, then McGowan and Rood's analysis (not to mention balance of power "theory" itself) would gain much more credibility. If, however, spatial alignment during the period is shown to be nonrandom—and more especially if the resulting pattern of alliance partners is indistinguishable from that of the 1910–1914 period's rigidity (which has been said to have been the cause of the disintegration of the European balance of power system and its transformation to a more-or-less bipolar one), then not only might McGowan and Rood's analysis lose much of its credibility and theoretical usefulness but also the usefulness of structural theories for the study of international politics in general might be brought into question.[10]

McGowan and Rood's data consist of 54 alliances among European states during the period 1814–1909. Although other states occasionally are included in these alliances, most of the activity concerns only five states—Austria, France, Great Britain, Prussia, and Russia. Their alignments during the period can be summarized according to partners as follows:

State	Prussia	Russia	Aligned with France	Great Britain	other
Austria	20	12	3	13	12
Prussia		11	1	6	9
Russia			7	9	3

[8] Dina A. Zinnes, "An Analytical Study of the Balance of Power Theories," *Journal of Peace Research* 4 (1967), 273.

[9] Nicholas Spykman, *America's Strategy in World Politics* (New York: Harcourt, Brace, 1942), p. 103.

[10] Arthur L. Stinchcombe's ideas concerning theory testing should be apparent here, if only in some twisted form. See especially his *Constructing Social Theories* (New York: Harcourt, Brace and World, 1968).

From this table, the frequencies of bilateral relations within the system can be seen. These can then be listed according to frequency (starting with the most frequently-found partnership):

Austria-Prussia	20
Austria-Great Britain	13
Austria-Russia	12
Prussia-Russia	11
Russia-Great Britain	9
France-Great Britain	9
Russia-France	7
Prussia-Great Britain	6
Austria-France	3
Prussia-France	1

Since there are ten possible pairs of states in the data set, the probability that any one pair will occur, given that any one pair is just as likely as any other, is 1/10. Ninety-one bilateral ties occur in the matrix above. Therefore, an hypothesis of spatial randomness among the states under consideration would predict that each cell frequency would be 9.1. It is immediately apparent from both the matrix and the list presented above that this is not the case. The alliances which formed the McGowan-Rood data set are not spatially random.

One finds instead that Austria is allied with Prussia more than twice as often as random distribution would predict. On the other hand, a Prussia-France alliance almost never occurs at all and an Austria-France one is very little more frequent. Only the Great Britain-Russia and France-Great Britain ties occur as frequently as balance of power "theory" would expect.

If Austria-Prussia alliances predominated during the 1814–1909 period in Europe while Great Britain-Russia and France-Great Britain alliances occurred at least no less frequently than they would by chance, the modal alliance pattern for the system as a whole would seem very little different from the pattern which obtained in 1914.[11] Balance of power "theory" (and all structural theories of international politics) then faces the question of why pre-1910 European alliance rigidity did not cause international system transformation whereas post-1910 rigidity did. The only satisfactory answer to this question may have to be found at the individual-nation-as-actor level of analysis.[12] Although this is another matter deserving further empirical research, it should be noted that Kaplan himself considered balance of power systems to be "subsystem dominant,"[13] in other words, not amenable to systems (structural) theories and explanations at all: but rather dependent upon the actions and orientations of individual states.

Finally, an even more fundamental criticism can be made of both the McGowan and Rood analysis and this very brief one. Both analyses are in some fundamental sense after the fact of alliance, concerning themselves only with the point at which the "specific interests" of states have already shown themselves and the states in the system have taken up sides according to those interests. Kaplan's classic statement bears repeating: "the 'balance of power' system postulates that any alignment is as probable as any other alignment *prior to a consideration of the specific interests which divide nations* (emphasis added)." By the time alliances form, it is too late to determine this probability. Any study which concerns itself solely with alliances which have already come into being cannot adequately address itself to the task of testing balance of power "theory."

FRED H. LAWSON
University of California, Los Angeles

[11] If the grand coalitions which were formed just after the Congress of Vienna are dropped from the McGowan and Rood data set, then the general bipolarity of the European state system during the remainder of the nineteenth century becomes considerably more evident. With an hypothesis of randomness expecting identical frequencies of 5.3 for each bilateral combination, the following frequencies are actually observed:

Austria-Prussia	14
France-Great Britain	7
Austria-Russia	7
Austria-Great Britain	7
Russia-France	6
Prussia-Russia	6
Russia-Great Britain	4
Prussia-Great Britain	1
Austria-France	1
Prussia-France	0

[12] For a very precise delimitation of the two levels of international political analysis, see William B. Moul, "The Level of Analysis Problem Revisited," *Canadian Journal of Political Science* 6 (September 1973), 494–513.

[13] Morton A. Kaplan, *System and Process in International Politics* (New York: Wiley, 1957), pp. 27, 125.

TO THE EDITOR:

As we understand Mr. Lawson, he makes six points in his criticism of our recent study of balance of power alliance behavior in nineteenth-century Europe:

(1) the choice of alliance partner (and, by implication, opponent) is an important aspect of balance of power theory;

(2) we ignored this "spatial" dimension of alliance aggregation in our exclusively "temporal" study;

(3) if alliance pairings among the five great European powers in the nineteenth century are approximately random, then our analysis and balance of power theory "would gain much more credibility," but if "spatial alignment . . . is . . . nonrandom," then our study and other "structural theories" of international politics "might be brought into question";

(4) according to his presentation of our data,[1] alliances "are not spatially random";

(5) moreover, *ex post facto* research, such as our original study and his comment, cannot "test" balance of power theory;

(6) therefore, our study and balance of power theories are of dubious value.

We appreciate Mr. Lawson's interest in our paper and we welcome this opportunity to respond to his interpretation of our work and thereby to extend research in this important area of international relations theory.

Before we discuss each issue Mr. Lawson has raised, two general comments are in order. First, although he cites Moul's fine paper,[2] we do not think he has fully understood its relevance to his critique. The units of analysis and the treatment of time are completely different in our article and in his comment. We presented a longitudinal study of one international system, whereas Lawson works with a single aggregated cross-section of time (96 years!) and ten pairs of states. In Moul's language, for Lawson to claim that his critique says *anything* about the findings of our article is a clear instance of "confounding the ecological fallacy with a cross-sectional—longitudinal fallacy."[3] However, Lawson's presentation of our data is of interest in its own right, a point we shall consider. Second, Lawson has not reanalyzed our data, he has simply presented *without citation* and with several counting errors[4] information reported four years ago in Table 7 and Appendix A of Rood's dissertation.[5]

(1) Without question, *at the levels of states and pairs of states*, patterns of choice of alliance partner are a fundamental aspect of balance of power theory. However, to examine this issue in an entirely static, cross-sectional fashion as Lawson does obscures the dynamic, sequential nature of alignments, making it difficult to discuss in an intelligent manner alliance flexibility and also making more probable a spatially skewed distribution of the behavior between pairs of states, or any other interacting units for that matter.[6]

(2) It is obvious that we did not examine the *dyadic level* problem of alliance choice in our exclusively *system level* paper. It is also obvious that Mr. Lawson has not read carefully or has not understood fully our article and Rood's dissertation from which he obtained our data. To repeat what we said in our article,[7] Rood's study was an explicit test of the *dyadic level* proposition that "any alignment is as probable as any other alignment prior to a consideration of the specific interests which divide nations."[8] Rood was unable to falsify this proposition when a probabilistic model of agreement among pairs of actors developed by Brams and O'Leary was applied to the data.[9] Moreover, subsequent research has shown that deviations from this model may be explained statistically by the magnitude of war within each pair of states,[10] a violation of its assumptions that balance-of-power theory predictions should affect choice of alliance partners *and* opponents.[11]

(3) We strongly agree that if it can be demonstrated that alliances occur on both a spatially and temporarily random basis, then our study and balance-of-power theory will have their credibility enhanced. The problem with Lawson's critique is that skewed cross-sectional data *are not necessarily evidence of nonrandomness in statistical models*, particularly (a) when one works with a simplistic probability model, equal probability, (b) when the N is small, only ten dyads, and (c) when the author merely "eyeballs" the data rather than applying the appropriate statistical goodness of fit test. Lawson, in his "analysis" of our data, makes the same mistake Londoners did during World War II when they were sure that German rocket bombs fell in clusters in certain neighborhoods. A Poisson-based analysis of the spatial distribution of south London bomb hits indicated perfect randomness.[12] We would advise Mr. Lawson to heed Feller's conclusion regarding "the established fact that to the untrained eye randomness appears as

[1] We made these data available to Mr. Lawson at his request, a fact he fails to acknowledge.

[3] *Ibid.*, pp. 501–502.

[4] The errors are: (1) our alliances number 55, not 54; (2) the Austria-Prussia pair has 21, not 20 alliances, and (3) the Austria-Great Britain pair has 12, not 13. These correct figures are used in the new analysis we report in this communication.

[11] That is, the patterned relationships of international conflict (magnitude of war within dyads) certainly are "specific interests which divide nations."

[12] William Feller, *An Introduction to Probability Theory and Its Applications*, 3rd ed. (New York: Wiley, 1968), 160–161.

regularity or tendency to cluster."[13]

(4) In point of fact, alliance choice *is* randomly distributed in the five power nineteenth-century European balance of power system. Table 1 shows this when the spatial *t*-axis is defined in terms of pairs of states and grouped in units of four alliances. We have also calculated goodness-of-fit tests for cutting points of two and three alliance units with similar results. Substantively, contrary to Lawson's reading of our data, we can report that the hypothesis, *in a balaace-of-power system, pairwise choice of alliance partner will be stochastically distributed* (the number of alliances formed per dyad is a Poisson random variable), cannot be rejected and is independent of how the number of alliances is categorized. Methodologically, Table 1 is cross-sectional (spatial) with all the attendant problems we have discussed regarding such analyses, and the N is very small. Nevertheless, we appreciate Mr. Lawson's stimulus and we hope that this original demonstration of the spatial randomness of alliances leads him to find more credible our original study as well as balance of power theory and structural theories of international politics in general.

Table 1. The Pair-wise Choice of Alliance Partners in Europe, 1814–1914, as a Poisson Distribution

Number of alliances per dyad	p[a]	Number Observed	Number Expected
0–3	.0198	2	.2
4–7	.2924	2	2.9
8–11	.4709	3	4.7
≥12	.2068	3	2.1
		10	9.9

$\chi^2 = 4.48$, d.f. $= 3$, $p = .21$

Kolmogorov–Smirnov test[b], $p > .20$

[b] Calculated from Sidney Siegel, *Nonparametric Statistics for the Behavioral Sciences* (New York: McGraw-Hill, 1956), pp. 47–51.

[13] Feller, *Probability Theory*, p. 161.

(5) It is difficult to determine what Mr. Lawson means by his concluding criticism that balance of power theory cannot be "tested" by nonexperimental methods including historical research and quantitative international political analysis. If he is correct, then the "theory" is no more empirical than the statement "everything which happens is God's will." We think Professor Kaplan intends to say more than such truisms and that in making statements about possible alliance partners and opponents, one must include the specific interests which divide nations as part of the statement of initial conditions from which the explanation (postdiction) or prediction is deduced. Could Kaplan mean anything else by his "classic statement" and still claim to advocate a "scientific" approach to the study of international relations as he so often does?[14]

(6) For all of these reasons, including his changes in the level of analysis and temporal organization, we cannot accept Mr. Lawson's criticisms. We do, however, thank him for his interest in our work.

EDITORIAL COMMENT

The Election of 1972: You Read it Here Last. With each passing presidential election, larger and larger bodies of public opinion data are collected—and by more and different sorts of people. The *Review* has frequently published the results of election studies done by our colleagues at the University of Michigan which through the years has focused the efforts of academics from many institutions. David Broder of the *Washington Post* suggested to us that when we presented the Michigan Center for Political Studies 1972 findings, we might also gather up comments and analyses from students having access to public opinion data originally generated in behalf of the McGovern and Nixon candidacies. The result of our followup has borne the fruit visible in the current issue, a symposium unusually complex and difficult to put together analyzing the 1972 presidential election just in time for the 1976 election. Art may or may not imitate life; we couldn't say. We do note, however, that social science tags along after real life at a respectful distance—in this case, four years.

Good Advice Needed. Now is a good time to remind readers that if they have suggestions or ideas to improve the *Review*, the transition period between managing editors is a strategic moment to let fly. Our successors in Pittsburgh are far more receptive and open minded than the barnacle-encrusted current management is likely to be. If you write, please do not omit a word of good cheer and commiseration, since a good part of the energies of any new administration must go into cleaning out the cobwebs neglected by the old.

Already improvements have been made in the processing of manuscripts. Prospective contributors should attend to the new instructions, printed in each issue, which, if followed, will cut costs without attenuating service to authors or readers. Good ideas like that are what we are after.

On the *International Encyclopedia of the Social Sciences**

RALPH ROSS

Scripps College, The Claremont Colleges

The *International Encyclopedia of the Social Sciences* had its origin in a series of discussions about how to revise the earlier *Encyclopedia of the Social Sciences* (New York: Macmillan, 1930). It was decided not to revise it, but to create a new encyclopedia, because social science seemed to be growing and changing so rapidly that our generation, and perhaps each succeeding one, needed its own statement. There are so many new ideas about what social science is and ought to be in the *International Encyclopedia*, that revision of the older *Encyclopedia* would not have been able to incorporate them in its structure. Continuity between the two is not only evident in many articles but also in the overlap of some sixty contributors.

The *International Encyclopedia* is both narrower and broader than the *Encyclopedia*. It does not compete with general encyclopedias on topics they do well. It has less purely descriptive matter and sheer information than the *Encyclopedia*, but more on methods and ideas. Indeed, its emphasis is on analytic and comparative study (the *Encyclopedia* did not, for example, have an article on comparative politics), and its editors believe that historical and descriptive materials in the articles should be illustrative of concepts and theories; people wanting the materials themselves in greater detail can find them elsewhere. New scientific interests are revealed by more studies and more pages on such subjects as human biology and linguistics, and on the relationships between social sciences and other studies, including literature and the arts.

We may be misled by the title, *International Encyclopedia of the Social Sciences*, for it gives the impression that the work it presumably supersedes, the *Encyclopedia of the Social Sciences*, was only American, or at least not intentionally international in scope, and that is not true. American contributors to it were chosen, sheerly for the sake of convenience, if they were thought to be as able as their foreign counterparts; otherwise they were not chosen. Foreign contributors were asked to write in their own languages, which were translated. And all contributors were expected to be concerned with social science everywhere. Part Two of the Introduction (which alone covered about 118 very large double-column pages) was devoted almost entirely to the place of social science in Great Britain, the countries of Europe, Latin America, and Japan. The *International Encyclopedia*, despite its name, is chiefly American and English in its contributors.

The history of social science was more concentrated and had far more range in the older encyclopedia. Part One of the Introduction, which would make a stout volume in itself, dealt with the growth of social science from ancient Greece to its own time. The individual periods were discussed by such scholars as E. R. A. Seligman, W. L. Westermann, Tenney Frank, Harold Laski, Charles Beard, and Robert MacIver.

There was also a self-conscious attempt at unity which is lacking in the *International Encyclopedia*. There one must read widely to discover assumptions unstated by the editors. The *Encyclopedia's* editors were explicit; they found the social sciences justifying themselves as separate disciplines and continuing to exist in "water-tight compartments" (Vol. I, p. xvii, 1937 edition). Whatever virtue this had in the development of science the compartments should not be permanent, and the editors wanted to break them down. "The conclusions reached by the separate sciences were gradually recognized, therefore, as incomplete and provisional, and the demand went forth to attempt a better analysis through a more comprehensive synthesis" (Vol. I, p. xvii). The movement toward a science of society thus received an official cachet. The *International Encyclopedia* is quite unclear on the subject and, although some studies, like political sociology, combine elements that were once separate, water-tight compartments are found everywhere.

The *Encyclopedia* was less restrictive, more catholic, in what it surveyed. It designated ethics, education, philosophy, and psychology as semi-social sciences, and included articles under those headings with a view, perhaps, to completing that comprehensive science of society which shows the influences of common activities within the group on each of its members. Seligman, the editor-in-chief, even recognized "the sciences with social implications" (Vol. I, p. 3) as a class of social science. The *International Encyclopedia* treats psychology at length, including physiological psychology, as a part of social science, and contains articles on ethics and education, but it has no article on philosophy at all, in contrast to the *Encyclopedia*, which had a long, excellent article on the subject by John Dewey. Altogether, I must express a preference for the *Encyclopedia* as a

* *International Encyclopedia of the Social Sciences.* Edited by David L. Sills. (New York: The Macmillan Company & The Free Press, 17 volumes. 1968. $495.)

more coherent, more intellectual, better edited work.

Biographies of living persons were excluded from the *Encyclopedia of the Social Sciences*. Thus, for all the attention he attracted at the time, and although his work was completed, there was no biography of Gaetano Mosca. The *International Encyclopedia*, however, includes biographies of living persons assumed to have already completed most of their work, so their ideas and contributions can be judged; in practice, that amounts to including people thought to be important to social science who were born before 1891. It is a tribute to the choice of contributors to the *Encyclopedia* that more than one hundred of them were found worthy of being biographees in the *International Encyclopedia*.

In general, the articles in the *International Encyclopedia* are in alphabetical order, but where it seems reasonable they are placed under a more general subject. Thus the Rorschach Test comes under Projective Methods, and Balance of Payments under International Monetary Economics. The articles have useful selected bibliographies. The index lists, first, contributors, and then articles, in alphabetical order, and concludes with a classification of articles under appropriate rubrics.

Much of the academic community was involved in the preparation of the *International Encyclopedia*. David L. Sills was the editor; he was assisted by Associate Editors, Special Editors, and Editorial Staff. W. Allen Wallis was chairman of a distinguished Editorial Advisory Board and, a nostalgic note, Alvin Johnson, who was Associate Editor of the *Encyclopedia of the Social Sciences*, was Honorary Editor of the *International Encyclopedia* and gave time and counsel to the editors, although he was over ninety years old.

Before dealing with specfics, I should like to try to capture the overall character of the *International Encyclopedia*, the quality that gives it whatever coherence it has. The publication date is 1968, just yesterday in the world of scholarship, but the articles must have been written a little earlier, and ours is a time of rapid change. What I am suggesting is that the editors and contributors, people of distinction in the academy, made up a kind of Establishment of the social sciences, which is already being criticized, sometimes quite feebly, sometimes trenchantly and in essentials. I am not concerned here with the criticism of those younger, and occasionally older, scholars who were radicalized by the political atmosphere of the late '60's and want to politicize social science and scientific associations; I am interested in the kind of criticism that reconsiders the assumptions and general direction of the social sciences, and that may affect their future. It may prove useful to characterize the *International Encylopedia* by comparison not just with its predecessor, but with a great encyclopedic landmark of an earlier age, and for that I have chosen the *Encyclopédie* of the eighteenth century. The *Encyclopédie* was not intended just as a vast compendium of human knowledge in the Age of Reason, but as a synthesis larger and more ambitious than that aimed at in the *Encyclopedia of the Social Sciences*. The dreams of science are fitful, but recurrent, and although one aspect of the vision of Diderot and D'Alembert is still repeated by some philosophers of science, the reality, at least of the social sciences, is farther from the dream than it was in 1930.

The View of Knowledge

Evaluation and criticism get better and worse with the passing of time. Because we are not men of the Enlightenment, we do not breathe their air of ideas and values; we must, intellectually, reconstruct the climate of the Enlightenment, and we are prone to error. But we have new perspectives, which let us see past time from a vantage point that makes relations and patterns clearer, and some of our information is new. Thus what the philosophes took to be simply knowledge, we see as part of their age. In that respect, if not in others, we can write of Diderot's *Encyclopedia* with a confidence unmatched by Diderot's contemporaries. So it will be in the future with the *International Encyclopedia of the Social Sciences*. In the meantime, it is still rewarding to compare the *International Encyclopedia*, in its view of knowledge, with Diderot's *Encyclopedia*.

The French *Encyclopedia* embraced all knowledge, not just the social sciences, and classified knowledge under the general headings, Memory, Reason, and Imagination (see below). The *International Encyclopedia* less schematically classifies knowledge in the social sciences under the headings of subjects, or branches of study, like Demography, Econometrics, and Social Psychology (in the extremely useful Index, Vol. 17).

D'Alembert, in his *Preliminary Discourse to the Encyclopedia of Diderot*,[1] is concerned with the way knowledge arises, and holds much of Locke's (and Condillac's) epistemology. "We can divide all our knowledge," he says, "into direct and reflective knowledge" (p. 6). Direct knowledge comes from the senses; reflective knowledge is what we make of direct knowledge. The first thing we learn from our sensations is the fact of our existence. "From this it follows that our first reflective ideas must be concerned with ourselves, that is to say, must concern that thinking principle which constitutes our nature and which is in no

[1] Published in 1751. My references are to the Library of Liberal Arts edition, Indianapolis and New York, 1963.

way distinct from ourselves" (p. 8). Thus Descartes follows on Locke.

Unlike Diderot and his colleagues, the editors of the *International Encyclopedia* hold no philosophical theory of knowledge on which its contributors would agree, except for the scientific method of our day, whose victory over all rival methods is complete in these pages. Diderot's *Encyclopedia*, too, had a special concern with scientific method, but it was essentially the method of Newton and the Newtonians, with an assist from Locke (see D'Alembert, p. 16ff.). The *International Encyclopedia* attends to the history of ideas in each of its subjects, sometimes thoroughly, as in Dwight Waldo's "Public Administration," sometimes casually, as in "Taxation." The *Encyclopedia* of Diderot takes the position that history is the basic source of certain kinds of knowledge, especially of ethics, politics, and human nature. On human nature and ethics, D'Alembert is quite Hobbesian and makes much of self-preservation. Human nature, ethics, and politics are a kind of continuum, although D'Alembert offers a caution: he describes politics as ". . . a sort of ethics of a particular and serious kind, to which the principles of ordinary ethics can on occasion be accommodated only with much subtlety" (p. 36).

Although Memory, Reason, and Imagination are the general headings under which D'Alembert places all knowledge, they are not utterly distinct from each other. They are, indeed, all faculties of Understanding, and are closely related. History (in the large sense in which everything has a history) comes from memory, Philosophy (which includes natural philosophy, or science—even to veterinary medicine) from reason, and the Fine Arts (all capitals are D'Alembert's) from imagination. Yet "Imagination acts no less in a geometer [i.e., mathematician] who creates than in a poet who invents" (p. 51f.). And all the subjects D'Alembert names are branches of knowledge, including the Fine Arts, not so readily accepted in our day as yielding knowledge.

Underlying the whole enterprise of Diderot's *Encyclopedia* is a belief in the unity and ultimate simplicity of knowledge. It is a belief that sustained the fascinating diversity of work and interest so typical of the philosophes of the Enlightenment, a quality popularly associated only with Renaissance man. In studying and doing many different things, the men of the Enlightenment were still concerned with one thing, knowledge, as it was revealed in all the activities of mind. D'Alembert himself, whose talents were not perhaps so great and diverse as Voltaire's, or Rousseau's, or Hume's, was a distinguished mathematician and scientist, a student of philosophy and psychology, about which he wrote elegantly, and the author of a work on music (*Élémens de Musique*, 1792) that was much acclaimed. He did not, like Rousseau, write operas, but he collaborated with him on articles about music in the *Encyclopedia*.

The great theme of the French *Encyclopedia* can be stated simply, as D'Alembert did. "The universe," he wrote, "if we may be permitted to say so, would only be one fact and one great truth for whoever knew how to embrace it from a single point of view" (p. 29). This faith is sometimes called the unity of science, but it is not that in our sense of "science"; it is the unity of "knowledge," which is all that "science" initially meant. Today we have distinguished science from other kinds of knowledge, like legal knowledge, and from activities like art, whether or not they yield knowledge. Science, to us, rests on observation and culminates in general laws, and that rules out many things from our own faith (which many share) in the unity of science. D'Alembert held a larger doctrine. Typically, he said: ". . . it is readily apparent that the sciences and the arts are mutually supporting, and that consequently there is a chain that binds them together" (p. 5).

Today's belief in the unity of science is like D'Alembert's in one respect: its idea that to unify science is to "reduce" it to its fundamentals. D'Alembert's version of reduction is implicit in this passage: ". . . if it is often difficult to reduce each particular science or art to a small number of rules or general notions, it is no less difficult to encompass the infinitely varied branches of human knowledge in a truly unified system" (p. 5). Perhaps each subject was ideally to be "reduced" to a few general laws, and then connected to other subjects by "a chain that binds them together," and the whole finally seen "from a single point of view" as "one great truth." Current ideas, less widely accepted at the moment than the unity of knowledge was by the philosophes, give the basic physical sciences a high priority, and present an ideal "reduction" of science as the statement of all scientific knowledge in physico-chemical terms.

This "reduction" includes human behavior, and so psychology as well as the other social sciences, but it excludes the arts. Properly so, too, when knowledge shrinks to science, for it is hard even to image "reducing" *Macbeth* or Michelangelo's *David* in any way, let alone stating them in physico-chemical terms. In their heyday, the logical positivists held the unity of science to be a cardinal principle of their philosophy, and sponsored the relatively small *International Encyclopedia of Unified Science*, which contains some splendid articles, but neither that doctrine nor the Enlightenment's unity of knowledge are the central themes in the *International Encyclopedia of the Social Sciences*.

Let me try to state those themes, as I see them recur in many articles. Whatever the individual

contributors or editorial staff may have thought they were doing, the *International Encyclopedia* does not merely report the current state of each subject, but the current state of social science itself. With only minor disagreement among the contributors, social science is perceived as continuous in general method with physical science and, perhaps as a result of that, is understood by some contributors as value-free. The *International Encyclopedia* is the fullest statement of what a (perhaps value-free) social science, modeled on physical science, has accomplished in our time.

Some contributors, like Sheldon Wolin ("Political Theory: Trends and Goals"), think it naive to expect social science to be value-free, but many contributors simply take it for granted. The more theoretical among them are explicit, and distinguish fact from value in different degrees. The range starts with Arnold Brecht ("Political Theory: Approaches," Vol. 12), who wants to use the word "science" in such a way that "the validity of ultimate moral standards of valuation cannot be established through scientific means" (p. 308), but still permits "scientific political theory" to function "so as to make an informed choice [of goals and goal-values] possible" (p. 313). This may be a refusal to meet the issue squarely, because of the word "ultimate." An informed choice among values is a great deal; it goes a long way toward making facts relevant to values, and it may be *hubris* to expect more. Also, Brecht wants us to put the study of "goals and goal-values in the center of political theory, where it used to be" (p. 313), but on a strictly scientific base. Perhaps that, too, is *hubris*.

The range of opinion on fact and value continues throughout the *International Encyclopedia*, and one reads Felix E. Oppenheim saying bluntly ". . . normative principles cannot be derived from factual generalizations" ("Equality: The Concept of Equality," Vol. 5, p. 107), without Brecht's elaborate qualifications. This is an extension of the social-scientific claim to be value-free, as is the first statement I quoted from Brecht, going beyond description of science as containing facts which are value-free to a philosophical position in which values are fact-free. Perhaps normative principles cannot be derived (i.e., logically inferred) from factual generalizations *alone*, but Oppenheim's failure to qualify his principle in this way makes it seem that we cannot learn about our values from experience, that factual generalizations do not affect values. Experience leads us to facts and factual generalizations, and experience shows they do bring clarification and alteration of values; if they did not, we would all be doomed to dogmatism or caprice.

As for a value-free social science: what parts of it are value-free? There can be little dispute that values enter science in the selection of problems and the application of conclusions. Beyond that, matters are less clear. Do values enter in the choice of methods, for example? They may. The area of value-free science, then, becomes, first, the ways in which methods, however selected, lead to conclusions and, second, the actual statements within the body of social science, including particular descriptions and generalizations. Here, however, the values *of science* play their part. Data are selected because of their relevance to hypotheses, those aspects of experience which are thus relevant are described, other aspects are ignored, and the described aspects of experience are called "data." If only the *shape* of a snowflake is relevant to a hypothesis, its color and temperature are ignored. Generalizations are formulated so they are testable and, perhaps, relate clearly to other generalizations. Experiments must be replicable, and evidence must be honest.

To rule the values of science out of the general realm of values, which is a possible defense against what I have said, one must either qualify the statement that science is value-free by asserting that it is free of nonscientific values, or one must classify scientific values as procedure or method, thus denying they are values at all. Perhaps in the second case one can accept truth as a value and relegate all other scientific values to the category of means. Then one can possibly assert that science *ought* to be value-free and ask whether in fact it is.

Another justification for value-free social science might come from the perspective of use and application. The truth such science discovers would work when used. For some, that is itself a definition of truth. Again, this argument is all right, too, so far as it goes, but it leads quickly to an ethical quagmire, because of the ambiguity of the word "work." Should all the conclusions of social and behavioral science be spoken freely, or is it better to repress some conclusions in the interest of a just society, *whatever we mean by that*? If, for instance, it should turn out, in repeated studies, that ethnic group A falls far short, on the average, of other ethnic groups in the amount and quality of education its members can absorb, might not one consequence of such knowledge be an imposed inequality of educational opportunity, and might not that inequality lead to more and worse consequences? Such truth would "work," in a sense, but not as many people would want it to. Shall we then repress the utterance of some conclusions? And can we? If the conclusions are known, will they not be said? It is only a little step from granting that we should, but cannot, repress dissemination of those conclusions, to advocating that we should repress the research that might breed them.

Perhaps the social scientist wants to be above the social battle and simply proclaim that science its uses then falls on others. At once we are back to the initial argument about the physical scientists who discovered nuclear fission. Is a human being entitled to compartmentalize his life so that, as scientist, he forbids himself to know how his conclusions will probably be applied, even when that is obvious? As a matter of fact, mustn't he lie to himself sometimes, pretending he does not know what he does know? An unhappy situation for any scientist, but especially for the social scientist, because the probable application of scientific knowledge is a legitimate question in social science.

Then, what of the sentences within social and behavioral sciences? Are they all free of implied value? Max Weber, who wanted a value-free social science, said the state has a monopoly of legitimate force. Is "legitimate" a value-free word? Doesn't "illegitimate force" sound morally bad? And how about the current description of politics as "the authoritative allocation of values"? Isn't authority legitimate and good, as opposed to illegitimate and bad? Further, when a "social item" is called functional for the maintenance of a system, only those who oppose the system itself are likely to think of that item as bad; for others it is probably felt to be good. If we agree that something is dysfunctional, don't we want to be rid of it if we can? Being rid of it, or substituting something functional for it, requires purposive action, and purposive action is hard to conceive without some value or values to guide it. Even if we do not intend to act, a need for action is implied.

When the economist says that particular legislation will increase inflation or unemployment or will bring depression, his statement is more than prediction; it is also a warning that our values will not be served. When the political scientist asserts that some governmental action may cause civil disorder, there is no value-neutrality in "civil disorder." We may not only conclude that some sentences in social science are not at the moment value-free, but we may question whether social science can at any time be entirely value-free. The thrust of that question comes not only from the subject matter of social science, which is human behavior, but from the nature of language as it is developed in human cultures.

Ordinary language is drenched in values. Most people have trouble articulating their own values explicitly, but those values fashion their conduct and their words. The language of imaginative literature is even richer in values than ordinary language, while the language of natural science eliminates values as much as possible. The poet is always concerned with valuing, and shapes his language to reveal his values. The physicist may be obsessed with scientific values, but uses language in his scientific work so it results from, but does not reveal, those values. Yet even natural science, when it deals with matters that affect man, uses of necessity a less neutral vocabulary. Language about quasars can be quite neutral, but language about pollution cannot, at least in the same degree.

Social science may seek a technical language, but it can be utterly technical only here and there, usually in the use of mathematics. Otherwise social science is condemned to ordinary language and its heavy freight of value. It stands somewhere between common speech and the language of natural science; and however much it aspires to the latter, it is mired in the former.

There is still another point to be made about value-neutrality, apart from the individual sentences of social science. I have suggested considerable agreement about the importance of value in choosing a problem. As social science gains in prestige, one can anticipate mounting social pressure to work on problems that are not merely of scientific interest but bear on the problems society is facing. Successful work can then become a basis for public policy. Indeed, this is already the case. I cannot believe that a social scientist who knows that his work may influence public policy will regularly do that work with no hint of the policy he prefers, even when that preferred policy must be carefully based on the outcome of his research. And policy, of course, always involves value judgment. Even a study of the relationship between types of housing and the incidence of crime contains an implied preference for a type of housing that correlates with a low incidence of crime, unless other consequences of it are even more dreadful. Should such a study be undertaken when a public housing agency is interested in the question and clamors for more information, the policy implications of the study are likely to be overwhelming.

These considerations cast doubt on the possibility that a social science can be modeled on the physical sciences. And there is a reasonable chance that the idea of physical science in the minds of most social scientists is quite different from the idea of physical science in the minds of most physicists. I am thinking of the paradoxes of quantum mechanics, like those that come from holding both a wave and corpuscular theory of light, and of the primacy of the indeterminacy principle, at least in dealing with subatomic particles. If the ideas of physical science held by physicists and sociologists are indeed different, then many social scientists are imitating a model of their own construction, to which they ascribe the high prestige properly due to quite another model. But that is really of small consequence compared to the question whether the scientific model of social science, wherever it

comes from, is indeed appropriate to social science.

A completely obvious difficulty with the nomological pattern of physical science in its application to social science is consistently neglected: the creation of a great work of art. One can undoubtedly state general laws about painters and the conditions under which they paint. These laws might apply to Leonardo as plausibly as to any other painter, but how could they explain that, on one occasion, what he painted was *The Virgin and Child and St. Anne*. I don't mean the subject; I mean the picture itself which, whatever its relations to other pictures, is sufficiently different from them so that *it is a unique event* in the history of the world.

What happens when we constantly fit particular occurrences into the Procrustean bed of general law is that we eliminate individual differences and individual purpose. There is no great problem in treating atoms *of the same kind* in this way; they are not different from each other and they have no purposes. But dealing with people may very well be another matter. It seems entirely possible to explain some events individually and thus to include purpose, with all its value-components, in the explanation. Would such procedure destroy social science? I see no reason why it would. Its consequence, however, would be a new direction in social science, perhaps part of the social science of the future, and perhaps with a different name, in which exploration of purpose and value, with due regard to morals, held a central place.

Propositions about Administration

A large body of knowledge, well enough organized so that the information one wants is never beyond his finger tips, can be immensely useful. That is surely true of the *International Encyclopedia* although, as I shall try to show, there are problems of inconsistency throughout it. One use to which the *International Encyclopedia* lends itself is a summary of knowledge in a given area. Thus Howard R. Alker, Jr. and P. G. Bock published a piece called "Propositions About International Relations" in the *Political Science Annual of 1972*, basing their propositions on material in the *International Encyclopedia*. It is impressive work and, in an effort to see how readily it can be done, I tried my hand at the same sort of job for Administration and Public Administration.

My results were somewhat unsatisfactory, or I should record them here. In order to write such a set of propositions with any confidence that they represent the thought of the distinguished authors of articles on the subject, I would have to be sure they all agree, and that does not seem to be so, although here and there a subset of propositions is relatively clear. Herbert Simon, for example, takes some conclusions of human relations research to be unexceptionable, especially as they apply to blue-collar workers and lower supervisory levels of organization (Vol. 1, "Administrative Behavior"). Three such propositions follow:

(1) Employees who feel more free to set their own work pace prove to be more productive than those who lack this sense of freedom.

(2) Noneconomic motivations, especially in primary work groups, are more important determinants of human behavior than economists of scientific management suppose.

(3) Under many circumstances, moves to more nonauthoritarian and egalitarian management styles increase productivity, acceptance of change, and worker satisfactions.

All this has little to do with the motivations of executives; it is rather motivation induced in others by executives. It is about executives and administrators of the higher echelons that we know least. Also, Simon's concern with business administration, whose emphasis is on productivity and profit, does not always appeal to those students of public administration whose interest in public policy is quite different in nature. Dwight Waldo expresses it this way: "Simply put, students in Public Administration were inclined to feel that Simon's work did not describe the world of public administration as they had experienced and observed it. To a generation emancipated from the politics-administration dichotomy, Simon's separation of fact and value seemed but another artificial division of the universe into two realms" (Vol. 13, p. 155).

Even within public administration itself, the disagreements are serious; they begin with a question of definition. There is substantial agreement that administrators affect policy. They don't simply carry out decisions made by politicians. But administrators who are not elected must be distinguished from politicians who are. Herbert Kaufman defines administrators as appointed officers in governmental service who supervise others, and he distinguishes administrators from formal rulers who are, one assumes, elected or hereditary (Vol. 1, "The Administrative Function"). Norton Long defines administrators as public officials other than judges or legislators (Vol. 1, "The Administrative Process") and so differs from Kaufman by including all those in the executive branch of government as administrators, thus meaning what journalists do, or for that matter the man in the street, when they speak of "the administration."

Waldo finds no moment in history when the study of public administration began, but comments that an essay by the young Woodrow Wilson is often taken as a symbolic beginning (Vol. 13, p. 146). Wilson wanted to use European ways of

training civil servants and studying administration, not, of course, for their monarchical or autocratic ends, but to perfect our "republican-democratic constitutional system." The more one reads about administration the more one wonders whether we are not perfecting the double-edged means and neglecting the ends. Indeed, Waldo argues that among the areas inadequately studied today is "the tremendous expansion of 'government by contract and grant,' which has blurred the lines between the public and private sectors and between the federal and state spheres" (Vol. 13, p. 153). Perhaps, if the study of public administration becomes increasingly value-free, we may totally neglect such matters.

I hope Alker and Bock's propositions were based on greater agreement than I could find in the writers on administration, although international relations strikes me as a subject at least as controversial as administration. Of course, one is on fairly safe ground in dealing with international treaties and agreements, although much is hidden from us, and on even safer ground in dealing with the structure of administrative agencies, at least as they are described in organization charts; but process, behavior, and function are another matter. Let me cite one conclusion about the study of public administration in Waldo's careful and thorough article on the subject:

> That the political process reaches deeply into public administration and that the making of public policy is an important activity of public administration have . . . been all but universally recognized. But the response has been varied: there is still no general agreement on what conclusions follow, what the methodological implications are, what lines of inquiry are indicated as most appropriate and fruitful, what the implications are for programs of education and training. The discipline is presently trying to find its way through the tangle of issues. Many of the issues are posed in putative dichotomies and verbal antinomies: politics and administration, political science and Public Administration, science and art, pure science and practical science, fact and value, prescription and description, administrative science and administrative sciences, diversity and similarity, absolutism and relativism, universality and uniqueness, generality and concreteness. Whether in general or in any particular case the dichotomies are properly conceived, the antinomies properly opposed, is questionable, and they undoubtedly present a tangled skein to the student. In the last analysis, however, it must be universally conceded that important problems are involved (Vol. 13, p. 154).

Indeed, very important problems are involved, some of which, unlike most of Waldo's catalogue, are at the very heart of democratic government—problems like consent, representation, and responsibility. But these are problems that seem to slip through the net of Public Administration or were never in it because they were placed in still other nets. The treatment of administration in these articles is therefore as interesting for what is unsaid as for what is said. As a single instance, let us consider the disparity I have mentioned in the definitions of administration.

What is left unsaid is the enormous difference in consequences that follows from this difference in definition. Neglecting that difference means little for the description of the administrative process or administrative behavior, even for Public Administration as a study, but it means much for the study of discontent, dissent, and revolution. When the people assume that the government or the state is separate from the administration (and the government, as I have said, is usually equated with the executive), then discontent may lead the people to appeal to the king or president to save them from his corrupt and wicked ministers. Russians used to appeal to the Czar to replace the ministers who were in fact carrying out his orders, and American colonials begged George III to protect them from his own policy, but as usual in such behavior, to get the beauty of it hot one must go to Machiavelli. In *The Prince* he tells us that Cesare Borgia "took the Romagna," which "had previously been governed by weak rulers, who had rather despoiled their subjects than governed them . . . so that the province was a prey to robbery, assaults, and every kind of disorder."

"He, therefore, judged it necessary to give them a good government in order to make them peaceful and obedient to his rule. For this purpose he appointed Messer Remirro de Orco, a cruel and able man, to whom he gave the fullest authority. This man, in a short time, was highly successful in rendering the country orderly and united, whereupon the duke, not deeming such excessive authority expedient, lest it should become hateful, appointed a civil court of justice in the center of the province under an excellent president, to which each city appointed its own advocate. And as he knew that the harshness of the past had engendered some amount of hatred, in order to purge the minds of the people and to win them over completely, he resolved to show that if any cruelty had taken place it was not by his orders, but through the harsh disposition of his minister. And having found the opportunity he had him cut in half and placed one morning in the public square at Cesena with a piece of wood and blood-stained knife at his side. The ferocity of this spectacle caused the people both satisfaction and amazement" (*The Prince and The Discourses*, Modern Library, p. 27).

When, however, the public makes no distinction between government and administration, it blames the government for what goes wrong. This may

happen regularly at times of great public outrage, but it is probably fed by the arrogance of less Machiavellian rulers than Cesare, who do not hesitate to support their ministers openly. Then King Charles's head rolls, the Czar is shot, or an American president resigns. The president, in any case, is not so remote from the public that his political positions are utterly unknown, so he may survive some scandals like the Tweed Ring or Teapot Dome, but his complicity in Vietnam bombings and Watergate can destroy him. Thus the practical consequences of abstract or technical distinctions as they trickle down to the media, public opinion, and political action are unintended because they were not considered.

Consistencies and Inconsistencies

In turning to the specifics of the *International Encyclopedia*, one notes instantly a high level of individual performance and an excellent use of human resources. There are too many good articles to single out the best, and many articles are written by just the person one wants to read on the subject (although one misses people one has expected, Robert Merton, Paul Samuelson, Ernest Nagel, and others): Talcott Parsons, for example, contributes eight magisterial pieces. Current interests are thoroughly pursued: Systems Analysis gets 5 articles and 43 double-column pages; Information Storage and Retrieval gets 5 articles and 29 pages. The prose is all readable and was, presumably, carefully edited.

The inclusion, already noted, of much history of each topic, puts subjects in perspective and indicates the difference between the ideas and methods guiding current work and the ideas and methods of the past, including the immediate past. This virtue is enhanced by a wealth of biographies which point out contributions to social thought in both the past and the present. There is even a re-emergence of neglected work; Arthur F. Bentley is a case in point: his quite original book *The Process of Government* was published in 1908 (again in 1935, but little noticed) and not republished with any acclaim until 41 years later. Instead of the silence about him, which lasted far too long, there are many references in the *International Encyclopedia*, and a biography.

The selection of people for biographical inclusion is judicious, on the whole. Although they are often neglected in contemporary discussion, T. H. Green and Bernard Bosanquet are given a rightful place here. All the major figures are in evidence, but the cutoff point, as one moves down the scale in importance, is not always clear. That, of course, is an obvious complaint that any reviewer would make of any work like this. It is perhaps sensible, granted a limitation of space, to have biographies of Bentham and J. S. Mill, but not of James Mill. Is it equally sensible to include Grotius and Bodin, but not Pufendorf? And what was the cutoff point that excluded Plekhanov and Bukharin but included Harry Elmer Barnes and Samuel A. Stouffer?

The work of the editors is by no means on the high level of so many contributors, and where the contributors err, the editors are at fault, too, in not knowing it. Let us look first at some matters of organization. A question about the principle of selection, and that of classification, enters in the choice of topics, as well as in that of biographies. There are separate articles, for example, on alienation and integration, but none on anomie, which is treated under "Durkheim." A more serious question is whether there are genuine differences in the various disciplines that make up the social sciences, but that is not entirely a question of editorial decision; it is also a matter of nomenclature and work in the field. Thus there are separate articles on what may not be separate subjects, Political Behavior and Political Sociology, the former indexed under Political Science and the latter under Sociology, and separate articles on Cultural Anthropology and Social Anthropology. To mark a further difficulty, there is not only "Political Sociology," but also "Political Anthropology: The Field," and there is no "Political Organization" under "Political Science," but only under "Political Anthropology."

The distinction between culture and society, or between cultural systems and social systems, is sufficiently established that it may justify a distinction between anthropology and sociology or lead to a division of study in both anthropology and sociology. In fact, the articles, by their very names, intimate that such a division is made between cultural study and social study in anthropology, but not in sociology (whereas "culture" has seemed a key category of anthropology and "society" of sociology), although if the culture-society distinction yields two types of work in anthropology, it would seem reasonable that it do the same in sociology. Yet the names seem to mislead the reader into a distinction without much difference. Is it merely the case that when English anthropologists say "social," Americans say "cultural"? And must the *International Encyclopedia* duplicate articles because of such habits? It does so: when one examines the American David Mandelbaum's article, "Cultural Anthropology," and the Englishman Raymond Firth's "Social Anthropology," one is struck by a virtual identity of definition. Mandelbaum writes: "The central task of cultural anthropology . . . is to study the similarities and differences in behavior among human groups, to depict the character of the various cultures and the processes of stability, change, and development that are characteristic

to them" (Vol. 1, p. 313). Firth defines his subject thus: "Social anthropology aims at understanding and explaining the diversity of human behavior by a comparative study of social relationships and processes over as wide a range of societies as possible" (Vol 1, p. 320).

Further similarities under different names are hidden in other ways. In her article, "Political Anthropology: The Field," Elizabeth Colson distinguishes her subject from Political Science by calling attention to the mechanisms of control "in the seemingly amorphous stateless societies" (Vol. 12, p. 191). Such societies are apparently the meat on which anthropology feeds, but alien to the political scientist's diet. Yet in M. G. Smith's article, "Political Anthropology: Political Organization," not only stateless societies are treated, but medieval China and Japan, ancient Athens and Rome, and feudal France and Britain. In the very concept of political organization from the standpoint of anthropology, Smith shares the same ground as political scientists. He says: "Political organization has been defined structurally by reference to institutions that regulate the use of force and functionally with reference to social cooperation and leadership. Political organization can be described in terms of the processes of decision making found in a given population" (Vol. 12, p. 193).

The overlap (or identity) between subjects seems, if possible, even greater as one reads what is said of behavioral study in political science and of political sociology. Some universities recognize the difficulty of distinguishing the two clearly, if at all, by offering joint appointments in Political Science and Sociology to students of political behavior. In "Political Behavior," Heinz Eulau says: "The analysis of political behavior proceeds from the assumption that politics as a special form of human activity is not, and cannot be, independent of what is known or knowable about social behavior generally. The primary objective of such analysis, therefore, is to link what is specifically political with other aspects of social relations" (Vol. 12, p. 203). And in "Political Sociology," Morris Janowitz says of his subject: "Broadly conceived, political sociology is concerned with the social basis of power in all institutional sectors of society . . . in narrower terms, political sociology focuses on the organizational analysis of political groups and political leadership" (Vol. 12, p. 298). Although their subjects are similar, to say the least, the political scientist emphasizes the social basis of his work, perhaps to separate his subject from the rest of political science, and the sociologist emphasizes the political character of his work, especially when he writes "in narrower terms," perhaps to separate his subject from the rest of sociology.

Then, when writing of particular areas within their subjects, Eulau and Janowitz come even closer, as their treatment of elites testifies. Thus Eulau writes: "The systematic study of elites, particularly in terms of their social backgrounds, has long been a concern of political science, but more recently research has been directed to recruitment and career patterns, much of it conducted in specific institutional settings" (Vol. 12, p. 205). Curiously, the same type of study of elites went on in political sociology, and an identical change in emphasis has come recently, for Janowitz tells us: "Elite analysis has shifted from an exclusive concern with social background as a determinant of elite behavior to a broader concern with the processes of recruitment, career development, and patterns of interactions" (Vol. 12, p. 303). One wonders whether separate treatment of two subjects, political behavior and political sociology, is based on another distinction without a difference, and whether a number of subjects listed separately in the *International Encyclopedia* are kept apart, not by the demands of knowledge, which would unite them, but by the academic autonomy of university departments. Nonetheless, the separation of subjects in these volumes was an editorial decision, possibly an implicit one, and the editors must be held responsible.

A minor aberration that occurs too often in the *International Encyclopedia* is the slip, when suddenly something silly is said, and the minor error, which may be where the contributor nods, and where an alert editor would have intervened. The tendency to document everything, whether it needs documentation or not, is sometimes responsible for these follies, which almost approach the level of saying, "It sometimes rains, as Professor Robinson so sagely observed." Worth noting, too, is that some scholars invent names for well-known phenomena and then, because they are given credit every time one of their names is used, there is finally an assumption that they discovered each phenomenon they named or renamed.

There are many examples. In an otherwise sophisticated article on political theory, Sheldon Wolin describes a current development: "The contemporary conventions reject so-called grand or comprehensive theories and prefer to pursue testable hypotheses. According to one representative viewpoint, 'Whether the proposition is true or false depends on the degree to which the proposition and the real world correspond' (Dahl 1963, p. 8)" (Vol. 12, p. 327). This sounds as though Robert Dahl, in his *A Preface to Democratic Theory*, disclosed, along with other representative theorists of of our day, a new and rigorous demand of political study, which turns out to be only the hoary, bewhiskered correspondence theory of truth.

James C. Davies ("Literature: Political Fiction") writes about some political fiction with insight and admiration, and reveals very wide reading. Yet somehow he has characterized a great novel in an utterly unrecognizable way. "Franz Kafka in *The Castle*," he says, "has his protagonist, K., use sex to get ahead, to try to get the attention of the leader, the unseen chief in the castle. The wretch K fails because he is concentered all in self and at last can only throw himself on the infinite mercy that accompanies infinite power" (Vol. 9, p. 438). Incidentally, "the wretched K." would be more accurate than "the wretch K."

One article that might be singled out as especially cogent, Seymour Martin Lipset's "Social Stratification: Social Class," contains a sentence that an editor should have deleted or altered radically. After suggesting that stratification ought to be studied internationally as well as nationally, and that vast differences in per capita income and national wealth affect class relationships between nations as well as within them, Lipset adds: "A Chinese communist has already advanced the thesis that the significant class struggle is between the predominantly rural nations, which are underdeveloped and very poor, and the urbanized, wealthy ones (Piao 1965)" (Vol. 15, p. 314). The reference to Piao is to an article by Lin Piao in the Peking Review. Lin Piao, now vanished, China's Defense Minister at the time Lipset wrote, and expected by many Sinologists to be Mao's successor, deserved more of a description than "a Chinese communist," and since Lin was his family name, the reference should have been to Lin, not Piao. More important is the error of crediting to Lin Piao an idea that comes directly out of Lenin's *Imperialism; the Highest Stage of Capitalism* (1917), a regular source of Chinese communist thought—an idea, further, that was not even original in its basic form to Lenin, but borrowed openly from J. A. Hobson, whose *Imperialism; A Study* was first published in 1902; so that what is stated as a new development in the study of social stratification is, in nearly its current form, almost as old as the twentieth century. Everyone who has written a book has made such errors, but editors usually keep them from the printed page.

Should these slips have been caught by the editors and removed with a blue pencil? That question raises the whole issue of the editing of the *International Encyclopedia*. The copy editing is superb (e.g., there are almost no typographical errors) but who did the actual editing, copy editors or the contributors' peers? It is important to ask that question, because the contributors sometimes contradict each other, define the same thing differently, or come to opposed "definitive conclusions" about the same matter (this is an encyclopedia, after all, and its contents are readily taken as definitive). But, first, there are many small examples of what may be simple editorial carelessness. In his "Ideology: Concept and Function," Edward Shils writes about ideology for the most part as it functioned in Nazi Germany and still functions in the Soviet Union. He contends, for example, that no great ideology has ever been committed to the scientific pursuit of truth, and says further: "Ideologies which concentrate on politics do so because for them politics embraces everything else. . . . Thus, no sphere has any intrinsic value of its own. There is no privacy, no autonomous spheres of art, religion, economic activity, or science" (Vol. 7, p. 68). It must have been the editors, for it could not have been Shils, who wrote in brackets at the end of the article: "For specific examples of ideologies, see *Democracy*. . . ." Whoever wrote that either did not read the article or did not understand it at all.

Under the general heading "Interaction," Talcott Parsons has an article called "Social Interaction," which is immediately followed by Guy E. Swanson's "Symbolic Interaction." In his first paragraph, Swanson informs us: "Among sociologists it [symbolic interaction] is often called social interaction" (Vol. 7, p. 440). The articles are in fact not on the same subject, but the reader is easily misled into believing they are.

Should the editors have checked for diverse comments on the same matter? Should they have notified contributors who contradicted each other, and asked them to reach some agreement or at least make clear what their disagreement was, and with what other articles they were disagreeing? That would seem a simple assumption of responsibility, but it is not common here. The series of articles on evolution, for example, reveal a conflict about what has happened to human evolution as society and culture have developed, but the antagonists simply utter their own conclusions, with no indication that they are at all controversial or that other distinguished evolutionists disagree with them. S. L. Washburn and Jane Lancaster, in "Evolution: Human Evolution," state it as fact that man is not adapted biologically to the complex cultures he created. "Human biology evolved to be adaptive in a world of small society, great hazards, and personal skill. The human actor in modern society is too dominance seeking, too acquisitive" (Vol. 5, p. 221). Elman R. Service, in "Evolution: Cultural Evolution," views cultural evolution as transcending biological evolution, and gives the impression that we act in ways for which our biology is not adequate, though our culture is. He even finds contemporary cultural demands "*contra*biological" in repressing sexual behavior and in requiring that we share food, not simply compete for it (Vol. 5, p. 222).

Theodosius Dobzhansky, however, makes a

case for man's biological adaptation to modern society in his "Evolution: Evolution and Behavior," where he says that the chief determining factor in human evolution is culture. Human traits are characterized by genetic fixity and specialization or by genetic plasticity. As examples of these, genetic fixity occurs when natural selection favors mutant genes which in some climates make the inhabitants darkly pigmented, and genetic plasticity makes the pigmentation of other populations depend on exposure to the sun. Natural selection has on the whole, Dobzhansky says, favored plasticity of behavior; "Man's cardinal adaptive trait is his educability" (Vol. 5, p. 236).

In the article "Race," which is not under the general heading "Evolution," Marvin Harris cites and agrees with Dobzhansky, and states the position in a more extreme form: " . . . selection for behavioral plasticity, for freedom from gene-specific behavior, for high-order generalized learning receptivity, has been the most important source of biological control over the direction of hominid evolution during the last million and a half years" (Vol. 13, p. 267).

A last example: Seymour Martin Lipset holds (in the article cited) that alienation in Marx is essentially man's loss of autonomy (his truly human condition) because he is told what work to do, and how to do it, instead of being allowed a free and autonomous choice (Vol. 15, p. 300). But in his article, "Alienation," George Lichtheim says Marx believed that man's truly human or essential being exists in his labor, and that alienation arises from depriving man of the product of that labor, which is his own labor objectified, thus estranging him from both nature and himself (Vol. 1, p. 265f.). These are two quite different accounts of what Marx wrote in a few pages of his *Economic and Philosophic Manuscripts of 1884*, but they never mention each other.

Another matter that should be treated has nothing to do with editing or editorial policy, except indirectly, but with the degree of specialization of many contributors. That specialization is a hallmark of much contemporary scholarship, surely among Americans, and has brought a vast increase of knowledge, sometimes at the cost of breadth and an accurate perception of relationships between fields, a quality the editors particularly sought. The complaint itself is a commonplace which gains interest only through documentation, for there one can find the kinds of limits specialization imposes even on first-rate scholars.

In "Values: The Concept of Values," Robin M. Williams, Jr. deals of necessity with modern philosophers who write on the subject. The philosophers Williams discusses are Stephen C. Pepper and Ralph Barton Perry. Perry, in particular, had a considerable influence at one time through his characterization of values as any object of any interest. But that is not what Williams is really concerned with. He makes a distinction between the desired and the desirable, emphasizing the idea of values as the desirable, rather than what is merely desired. This he calls "one of the more widely accepted definitions in the social science literature" (Vol. 16, p. 283). It is a sophisticated definition, not easily used with simple scientific techniques, because the desirable is what ought to be desired in a given situation, and that cannot be discovered by, say, questionnaires, which can only ascertain what people do desire. The distinction and the definition are John Dewey's, part of his often unacknowledged influence on social science, but Williams does not mention his name. The reader is thus deprived of the chance of pursuing the idea in its fullest and most original form.

Val R. Lorwin, in his article, "Syndicalism," traces the syndicalist movements in Europe and America but, in his section on Italian syndicalism, omits any reference to its early role in the movement that led to fascism, probably its most disastrous mistake. Is this because Lorwin worked on syndicalism, but not on fascism, which might, if one did not study its development, seem another subject, with no roots in syndicalism?

Sometimes a contributor puts in material with which he has only a nodding acquaintance and then, if it is far away and long ago, may be supercilious about it. As an example, Leonard Berkowitz, in "Aggression: Psychological Aspects," comments, "Since the time of Aristotle, social science folklore has contended that an individual can be 'purged' of his emotions by displaying his feelings" (Vol. 1, p. 172). I assume the reference to Aristotle is to his *Poetics*, where he deals with purgation of the emotions. But, first, Aristotle is not talking about the purgation of all the emotions, but only of pity and terror which, in the *Rhetoric*, he describes as morbid. Secondly, it is the audience who are purged and the actors who arouse pity and terror in them, and not just by a display of emotion, but by incident and verse. As for the reference to folklore, one may agree or disagree with the *Poetics*, but he is bound to take it seriously if he has ever read it. If the reader of Berkowitz's article is innocent of Aristotle, he may be confirmed in the belief that his innocence is like that of Adam, not to be given up on pain of (social scientific) banishment.

The lack of sophistication that specialization can breed not only keeps it narrow, but on occasion simplifies in a way that violates the facts. Lorwin misses the full range of syndicalist possibility; one could not guess from his article that

Georges Sorel praised Lenin in 1919 and the Italian fascists in 1921. Berkowitz is deprived of understanding the development through time of Aristotle's doctrine of purgation, especially as it profoundly influenced the thought of Sigmund Freud. And Milton Rokeach dams the rich complexity of human values so that they flow into the straitened channel of egoism. In "Attitudes: The Nature of Attitudes," he writes, " . . . The function that seems to be served by all the values in one's value system is the enhancement of what McDougall has aptly called the master of all sentiment, the sentiment of self-regard" (Vol. 1, p. 457). That is a statement that can be defended only by the kind of ingenuity expended so lavishly to prove that all human action is pleasure-seeking, and like those arguments, its persuasiveness depends on begging the question.

While the editors are to be commended for the space given to the arts (Aesthetics, Architecture, Crafts, Drama, Fine Arts, Literature, Music, Primitive Art are general headings), a specialized preoccupation is noticeable in the articles themselves. They are written from the standpoint of social science, which is only right and fair in this setting. But they usually give no indication that there is any other standpoint, that literature, music, art, and aesthetics have their own warrant; and when a concession to other possibilities is made, there is no mention of what they are. Thus Irvin L. Child says correctly: "Although the term *aesthetics* has other specialized meanings, it has come to refer, in the context of social science, to the whole body of generalized inquiry especially relevant to the arts." Then, without hint of what the "other special meanings" are, he continues: "Aesthetics is the study of man's behavior and experience in creating art, in perceiving and understanding art, and in being influenced by art" ("Aesthetics," Vol. 1, p. 116). Yet, basic to the study of aesthetics itself is exploration of the creative process, of the nature of art, and of criteria which can distinguish good art from bad art, and better art from worse art. Child's article otherwise is sophisticated, and his range of reference properly includes Rudolf Arnheim's *Art and Visual Perception* (Berkeley: University of California Press, 1954), in which aesthetics penetrates the psychology of art, but the elimination of aesthetics from this article on aesthetics takes from Child and his readers any shred of personal judgment and evaluation and makes them dependent, as he puts it, on "the likes and dislikes of experts in an art, or their evaluative judgments" (*ibid.*, p. 120).

Harold G. McCurdy's "Literature: The Psychology of Literature" is, in general, most able and learned, yet it shares with Robert Escarpit's "Literature: The Sociology of Literature" an almost exclusive emphasis on literature as communication. However adequate such an approach is to expository writing, it is quite inadequate to imaginative writing (i.e., verse, drama, and fiction), in which experience is probed, shattered, and shaped, and a new experience is created which is shared, rather than merely communicated. Communication, of course, is an important element in society, and there is every reason why a sociologist should be concerned with literature as communication. But he should not therefore *conceive* literature exclusively as a pattern of communication, nor should his interest in communication lead him to forget the social and psychological importance of shared experience, which is a vital element in community. Escarpit does forget it; writing of literature as a pattern of communication, he says: "But this pattern alone is sufficient for the needed sociological investigation" (Vol. 9, p. 419).

Escarpit finally defines literature in terms of this pattern, thus converting what is "sufficient for the needed sociological investigation" into the very meaning of literature. "We are thus led to conceive of literature as a two-way communication in which an original message is broadcast by the writer to a community of readers, whose response to him takes the shape of thoughts, words, acts, and other messages, which react on one another and on the writer himself" (*ibid.*). Imagine how a first-rate literary critic would respond.

Beyond this Escarpit does not go, theoretically. He writes at length and informatively on such things as the nations and languages in which most books are published and read, the percentage of books translated, book selling, and the book market. All this is very useful, but it seems peripheral to the sociology of literature. What I regard as central is neglected, perhaps because it requires an interest in history that some sociologists do not have. The great questions, I believe, include: Under what social conditions is a great literature produced (e.g., the literature of classical Athens, of Elizabethan England, of seventeenth-century France)? Under what conditions are different forms of literature produced (e.g., why drama in Elizabethan England, lyric verse in the English Age of Romanticism, and fiction everywhere with the growth and triumph of the middle class?)? What are the social effects of literature of one kind and another?

These examples are sufficient, I hope, to illustrate the ways in which specialization, when not combined with other and related knowledge, narrows a focus and even misleads. There are many more instances of this narrowness in the *International Encyclopedia*, as there are many other instances of slips and of unmentioned disagreement and controversy. In the last case, I offered only a controversy about evolution as an example. Permit

me to add briefly, lest that seem isolated, two articles on prejudice.

For both Otto Klineberg ("Prejudice: The Concept") and J. Milton Yinger ("Prejudice: Social Discrimination"), prejudice is a prejudgment, existing before the relevant information has been examined. After that they disagree, without reference to each other. Klineberg thinks we can be prejudiced against either individuals or groups; Yinger that we are prejudiced against individuals *because* of their group affiliations. "Prejudice can be defined as an inner tendency to respond to persons on the basis of their group membership; it is a rigid, emotional prejudgment that gives an individual confidence that he knows all about a person when he knows his membership in a symbolically important group" (Vol. 12, p. 449). The issue is never joined. One assumes these contributors did not read each other's articles and no comment was made to them by the editors. Yet Klineberg allows what Yinger precludes, prejudice against a person, regardless of his group membership, because of his shifty eyes, clammy hands, or whatever, before there is any other knowledge of what sort of person he is. (Not that such knowledge always changes things; some prejudices are impervious to knowledge, despite Klineberg and Yinger.)

I should like to make two comments in concluding this review. For all the approval of the fact-value distinction among a group of contemporary social scientists, some topics trigger instant evaluations. Prejudice is, of course, one of these; social scientists are not likely to talk of healthy prejudices, especially as Klineberg and Yinger define prejudice. Edmund Burke had a different view of prejudice, but he also defined it differently. Nor are social scientists today likely to agree with Nietzsche that the weak and botched should perish. But perhaps nothing arouses so much open scientific commitment as democracy. Giovanni Sartori (Vol. 4, "Democracy") does much editorializing and utters many valuable value judgments. That might be expected, and the hardheaded may mutter something derogatory about political theorists. But value judgments about democracy also enter the very citadel of behavioral study.

In "Political Sociology," Morris Janowitz concludes his discussion with a straightforward avowal of the relation of his subject to values, and at the moment to democracy. "Political sociologists have been men of strong opinions, and they have been concerned with the value implictions of their work. But it is only since the end of World War II, particularly under the influences of the newer types of economic analysis, that some political sociologists have become interested in theoretical formulations which explore explicitly the conditions under which political democracy would be maximized . . . political sociology has come to be linked to the analysis of the economic, social, and psychological preconditions for political democracy" (Vol. 12, p. 306).

By and large, the contributors write about their topics calmly, neither starry-eyed about the future nor crying doom. But the *malaise* of our day can creep in, and then one hears a somber note, quickly muted, which may sound the end of an era. The late George Lichtheim was more explicit; he was not an academic social scientist and he operated with fewer restraints than they do. He argues that

> positivist sociology in the late nineteenth century fell heir to the unsolved problems of traditional metaphysics. . . . What appears at one level as the disintegration of traditional ways of life is reflected at a different level in the dichotomy of "facts" and "values." Since the intellectuals as a group form a stratum of society in which material tension is immediately experienced in theoretical terms, their role in developing concepts which reflect their own peculiar situation is obviously crucial. Provisionally it may be suggested that the intelligentsia's rejection of the modern world is central to the contemporary situation in philosophy. Yet this world is itself the creation of a rational science in which intellectuals have traditionally placed their faith. The paradox suggests that we may have come to the end of an important chapter in modern cultural history ("Alienation," Vol. 1, p. 268).

Lichtheim's judgment of our time includes, however inadvertently, the *International Encyclopedia of the Social Sciences* itself, but it derives, I am confident, from his knowledge of the literary and political intelligentsia and the journals where their work appears. Far fewer social scientists reject the modern world. Yet their work makes up a good part of the world that the intelligentsia reject and that is partly rejected, too, from within the ranks of social science.

An important conclusion about the *International Encyclopedia* is that it represents its time, and represents it very well, although in our day of increasingly rapid change, that time may already be the past. For this the editors and, especially, the contributors deserve enormous credit, although the editors did not do the coherent job they should have. Quarrels with articles in the *International Encyclopedia* (and my quarrels are evident enough) are quarrels with thought in our time, not just with social science, because much that can be said justly about social science can be said with equal justice about other branches of academic knowledge and about the nonacademic intelligentsia as well. Some criticisms apply especially to social science, though, and others to the rest of contemporary thought. Whatever new directions thought may take, social science as it appears in these pages will have made its mark and contribution.

Philosophy and International Violence*

TERRY NARDIN
State University of New York at Buffalo

The study of international politics has no established place in philosophy as an academic discipline. Professional philosophers who discuss the subject at all typically do so under the stimulus of external events, rather than as an outgrowth of other philosophical inquiry, and are likely to conceive what they have to say primarily as a contribution to public affairs. The fact that most of the attention among philosophers to international politics in recent years has been concerned with warfare, war crimes, and related themes pertaining to what might be called "international violence" bears this out. Violence is (or was) an *issue* of current affairs. As such, it is marginal to the more enduring concerns of philosophy, and the interest of philosophers in it is understandably a transient one. This is not to say that the scholarship produced under these conditions is without value; on the contrary, it is just because it does constitute an unusual contribution to our understanding of international politics that this work should receive wide consideration. Yet because the main stimulus underlying the recent growth of philosophical interest in the subject is one that arises outside of philosophy itself, that interest is likely to dissipate once the external forces sustaining it have diminished. It would therefore be good if the results of this interest could be assimilated and developed within the framework of continuing scholarship by those engaged in political and international studies.

In order for this to happen both the nature and limitations of this latest contribution of philosophy to the study of international politics must be understood. If one of its features is a tendency to abandon the field for greener pastures, another is the thoroughness with which the grass is cropped by this particular species of ruminant. Instead of the broad speculations about "the nature and causes of war" characteristic of so much of what passes for philosophy in the study of international affairs, the essays that constitute the books reviewed here contain knowledgeable and skillfully executed analyses of particular aspects of this highly organized form of human violence, such as strategic bombing,[1] genocide,[2] war crimes trials,[3] and conscientious objection.[4] Both the advantages and liabilities of the analytical style of philosophy pursued in these essays are related to this close attention to particular events, practices, and current controversies. The approach is one that *can* yield specific, fresh, and expert reconsiderations of fundamental problems. It can also go astray to become no more than a stale and inept rehashing of trivial problems. There is enough work of superior quality and interest, however, to reward time spent with these essays.

In a review of this kind it would be impossible to treat the results of each particular inquiry in detail, and in any case a broader assessment of the fundamental problems underlying the specific issues of contemporary debate might do more to advance the subject. I have therefore chosen to focus on four problems of general philosophical significance for the analysis of the various substantive topics currently receiving attention: (1) the nature and justification of the laws of war as an institution for the regulation of international violence, (2) the proper grounds for moral judgment of military conduct, (3) the dilemmas of attributing responsibility and blame for acts of military violence, and (4) the implications of alternative descriptions of such acts for both legal and moral judgment. These rubrics do not, however, exhaust the range of topics explored in these volumes.

* *Philosophy of War*, ed. Lewis White Beck (Special issue of *The Monist*, 57 [October, 1973]. Pp. 461–606. $2.25).

War and Moral Responsibility, ed. Marshall Cohen, Thomas Nagel, and Thomas Scanlon (Princeton: Princeton University Press, 1974. Pp. 182. $2.95).

Individual and Collective Responsibility: The Massacre at My Lai, ed. Peter A. French (Cambridge, Mass.: Schenkman Pub. Co., 1972. Pp. 207. $3.75).

Philosophy, Morality, and International Affairs, ed. Virginia Held, Sidney Morgenbesser, and Thomas Nagel (New York: Oxford University Press, 1974. Pp. 338. $3.95).

War and Morality, ed. Richard A. Wasserstrom (Belmont, California: Wadsworth Publishing Co., 1970. Pp. 136. $3.50).

[1] John C. Ford, S.J., "The Morality of Obliteration Bombing," in *War and Morality*, pp. 15–41, and Michael Walzer, "World War II: Why Was This War Different?," in *War and Moral Responsibility*, pp. 85–103.

[2] Hugo Adam Bedau, "Genocide in Vietnam?," in *Philosophy, Morality, and International Affairs*, pp. 5–46. Bedau's essay is an example of the helpful results that can be produced by the combination of analytical skill and substantive (in this case, legal) knowledge.

[3] The implications of "Nuremberg" are explored in many of the essays in these volumes, while the Calley trial provides the point of departure for those assembled in *Individual and Collective Responsibility*.

Violence Under Law?

Because violence is often thought of as the antithesis of rule-governed human activity, the notion that its initiation and conduct might be made subject to legal regulation strikes many people as self-contradictory. But the air of paradox thus generated is partially dissipated as soon as particular military practices and the legal rules that help to define and order them are brought into focus. For then, although there may be little agreement concerning the applicability, validity, or efficacy of particular rules, there can be little doubt that there *are* rules whose applicability, validity, or efficacy is being debated. Traditionally these rules have been divided into distinct bodies of law according to whether they sought to regulate the initiation of violence by states (*jus ad bellum*) or the conduct of hostilities once begun (*jus in bello*). The first seeks to establish a regime of law according to which the resort to armed force can be judged lawful or unlawful. The second seeks to limit the harm that belligerents can do to one anothers' armed forces, prisoners of war, and civilian populations; to facilitate diplomatic, medical, and humanitarian relief activities during periods of hostilities; and to regulate in numerous other ways the practices and relationships that arise under the special conditions of organized armed conflict.

With one or two exceptions, questions about the initiation of armed force have not occasioned particular interest among the philosophers represented in these volumes, although it is the principal question at issue in traditional discussions of the just war, and has provided the source of endless debates in legal circles concerning such matters as the definition of aggression or the legality of particular acts such as American intervention in Indochina. Insofar as there is presently a general legal attitude on this question, it seeks to identify lawful resorts to force with those that are undertaken in self-defense, and to rule out as unlawful the "aggressive" resort to force, aggression being identified with armed attacks against other states. Although the legal issues are in fact much more complicated, this distinction between lawful and unlawful war reflects a basic principle embodied in the United Nations Charter. It is similar to that contained in the Charter and Judgment of the Nuremberg Tribunal, with its category of "crimes against peace" according to which German leaders were prosecuted for waging aggressive war. Legally speaking, this conception of unlawful war replaced an earlier conception in which the resort to force was neither lawful nor unlawful, but rather (with certain qualifications and exceptions) a right whose exercise was left by international law to the discretion of individual states. As James Turner Johnson shows in his critique of it,[5] the newer conception of an unjust war as a war of aggression is one that has also infiltrated religious thinking on the just war; papal pronouncements, for example, have in recent years reinterpreted the traditional criteria for the just war (such as "just cause" and "right intention") so as to make them similar to those of the Nuremberg and United Nations Charters. The philosopher tends to regard this conception with much suspicion; as G. E. M. Anscombe puts it, "The present-day conception of 'aggression' . . . is a bad one. Why *must* it be wrong to strike the first blow in a struggle? The only question is, who is in the right?"[6] Johnson, too, urges a reconstruction of the *jus ad bellum* along traditional lines, but neither critic is explicit in suggesting how the traditional criteria such as just cause and right intention are to be incorporated in an effective *legal* regime.

Indeed, the difficulties are obvious. For all its defects, the criterion of "armed attack" is at least *relatively* clear. Naturally, there are continual pressures for existing legal criteria to be extended so as to legitimize almost any uses of force that states and other potential belligerents might wish to undertake; but it is just this problem that the legal process, as it goes on in United Nations debates, diplomatic negotiations and correspondence, judicial proceedings, and legal scholarship is designed to overcome. Thus, the criterion of armed attack is itself an attempt to limit the freedom of states to interpret the meaning of "aggression," a much more flexible notion. Similarly, over the years a relatively narrow conception of self-defense has evolved to distinguish this plea from the far more comprehensive justifications implied by notions such as self-preservation, self-help, and necessity. In contrast to the traditional just war criteria, which require moral agreement and the identification of intentions, the initiation of armed attacks and acts of self-defense against them are easier to identify and to define in an agreed way. One must therefore go further than merely noticing the moral deficiencies of present-day conceptions of unlawful war, which are in any case well known to international lawyers who have been struggling with these criteria for many decades, and try to weigh the costs and benefits of alternative principles according to which judgments of particular acts of violence in international disputes might be made. In doing so, it will be necessary to take account of the extremely diverse forms that violence can take and the circumstances under which it might occur, including such forms of action as blockades and "quarantines," interventions of various kinds, reprisals, and terrorist acts. The law can no longer, if it ever could, limit itself to regulating the movement of uniformed troops across clearly demarcated national boundaries.

[5] "Toward Reconstructing the *Jus Ad Bellum*," in *Philosophy of War*, pp. 461–488.

[6] "War and Murder," in *War and Morality*, pp. 43–44.

Any such more refined and particular examination of the forms and occasions for initiating violence will also call into question the point of distinguishing between *jus ad bellum* and *jus in bello*—the laws of war—which presupposes a clear distinction between war and peace as legal states that has been all but abandoned in current thought and practice. Perhaps the recognition of this fact is partly responsible for the concentration of most of the philosophical interest in law and warfare on the *jus in bello*, broadly reinterpreted so as to include civil as well as international armed conflicts.

The diversity of existing opinion concerning the laws of war is illustrated, in microcosm, by the various attitudes expressed in these essays toward the Nuremberg trials. They are merely the most recent of a long line of commentaries on the trials, and in the broad range of attitudes toward them that they display do not differ notably from their forerunners. Philosophical interest in Nuremberg can perhaps without too much distortion be made to conform to three stages in the reinterpretation of the Nuremberg events in the context of the Indochina War. In the first stage the moral dismay occasioned by the war and by American practices in it was uppermost. The Nuremberg principles offered a set of standards that were not only readily at hand, but possessed the particular appropriateness of having been inspired and applied by Americans, so that to judge by the Nuremberg principles was to judge ourselves by our own standards. Conscientious objectors soon began to express their position in the form of what became known as the "Nuremberg defense," and others wondered if there were not grounds here for identifying American military commanders and political leaders as war criminals. In this first stage, the moral and legal aspects of the Nuremberg principles were not clearly distinguished; a "war crime" could mean either a legal or a moral wrong, or both; and prominent writers, such as Telford Taylor, wrote as if the laws of war constituted a system of moral principles for judging acts of war.

The second stage consisted of greater discrimination and some disenchantment in the application of the Nuremberg principles. It was discovered, for example, that the law applied at Nuremberg left much to be desired, morally speaking, and commentators began to warn of the dangers of placing too much weight on the Nuremberg background as a basis for criticizing American military practices in Indochina. Thus, a writer like Richard A. Wasserstrom worried about the implications of a body of rules that appeared to him to equate military necessity with mere utility or advantage, or that employed legally and morally dubious notions such as those of criminal conspiracy and collective criminal liability.[7] Earlier criticisms of the Nuremberg trials from the point of view of fairness were resurrected. The Nuremberg precedent began to appear painfully complex and increasingly inapplicable from the legal point of view, as well as quite below standard from the perspective of morality. And this disenchantment leads directly to the third stage, in which the attempt to assimilate the Nuremberg experience becomes most fully philosophical. This stage is characterized by two sorts of inquiry. One is the careful analysis and criticism of the concepts employed or presupposed by the Nuremberg principles—concepts such as responsibility and guilt, or those which, like superior orders, embody particular understandings of the scope and limits of legal defenses. The other comprises attempts to articulate rationally defensible principles in terms of which the legal principles applied at Nuremberg could be judged, and upon which reconstructions of them might be founded. A similar evolution of ideas can be traced in attitudes toward other aspects of the laws of war such as the Geneva Conventions and related legal norms such as those of the Genocide Convention.

Underlying these changes is a deep interest, amounting almost to preoccupation, with moral issues; and although this is perhaps more to be commended than criticized, it has led to hasty judgments on the difficult issues of the relationship between morality and the laws of war. For example, Wasserstrom, whose doubts about the Nuremberg precedent have already been mentioned, finds the laws of war to be so morally deficient that we must cease to take them seriously as standards to be used in making judgments concerning military conduct. Instead, we should seek to articulate morally defensible standards upon which we might rely in judging war: "A preoccupation . . . with our legal responsibilities can tend to deflect attention from what is surely the central concern: that individuals, especially in time of war, try to do the morally right and obligatory things."[8] This rather blanket repudiation of a rich and well-established legal institution is surely an overreaction. As one of Wasserstrom's critics points out, to demolish existing institutions in order to clear the ground for the construction of new ones that

[7] "The Relevance of Nuremberg," in *War and Moral Responsibility*, pp. 134–158.

[8] Ibid., p. 158. The point is developed by Wasserstrom in a second essay: "The Responsibility of the Individual for War Crimes," in *Philosophy, Morality, and International Affairs*, pp. 47–70. Cf. Sanford Levinson in "Responsibility for Crimes of War," in *War and Moral Responsibility*, p. 109; "It would be better to focus clearly on the *morality* of warfare and to speak unequivocally of moral condemnation than to pretend that the category of 'war crimes' or 'war criminals' is meaningful."

more closely approximate a moral ideal is a dangerous tactic of political change.[9] Also implied in Wasserstrom's view is an argument for disobedience to the laws of war where they conflict with the requirements of morality; it is an argument of which we should be particularly wary. In this view the laws of war are seen as so bad, morally speaking, that the repudiation by governments and individuals of their obligations under them is scarcely thought to need justification. The anarchic implications of a principle according to which everyone—statesman or citizen, commander or corporal—takes "morality," not law, as the proper guide for both thought and action with respect to international violence are obvious.

Perhaps it is the uncertain content and legal status of the laws of war, together with widespread ignorance of how the system actually works, that explains why these issues have so far been debated with an imprecision that would be intolerable in discussions of political obligation and civil disobedience in the context of domestic law. It is, for example, important to discriminate among the various agents whose acts are affected by the laws of war, and to delineate the various ways in which they are affected. Its rules appear in a different guise to the young man facing induction and contemplating conscientious objection, the soldier in the field who is moved to reinterpret or disobey orders, or the policy maker choosing among alternative military strategies. Much more thought will also have to be given to the nature and purpose of the laws of war, which are variously presented in these essays as a coercive system of criminal law, as an impotent caricature of law properly so called, as a device for coordinating the pursuit of common interests among belligerents, and as a rallying point for principled opposition to morally atrocious policies and practices. The features of the laws of war as an institution and its place in the political order merit closer philosophical attention, not to mention the much more intensive empirical study from which philosophical criticism can be divorced only at the cost of impoverishing both.

Moral Puzzles

The unsatisfactory state of philosophical discussion of the legal dimensions of warfare reflects the fact that philosophers writing about it have been for the most part only peripherally concerned with the criticism and revision of law. The main task for philosophy, as they see it, has been to understand war as a subject for *moral* reflection and judgment. It is the attempt to solve the evident moral dilemmas raised in so acute a form by warfare that constitutes the principal interest of analytical philosophy in this area. With few exceptions, other philosophical tasks have been made subordinate to the pursuit of this goal. Thus, the criticism of law is motivated largely by a wish to articulate standards more adequate from the moral point of view than those presently embedded in the legal institutions affecting international violence. Similarly, the conceptual inquiries so characteristic of analytical philosophy are scarcely motivated by the intrinsic philosophical interest of the concepts particular to discourse about war, which is minimal, but rather by the wish to solve moral problems. There are different reasons for this interest in moral questions. It may occur as the result of an attempt to solve a practical problem, such as how to justify selective conscientious objection. Or it may be undertaken in a spirit of moral outrage and of determination to advance in public debate the standards of sanity and virtue. Sometimes the subject seems to be taken up as little more than a field for the application of moral theory, as a setting for the conduct of moral or meta-ethical debates originating outside the realm of warfare itself: a new theatre opened up in the Hundred Years War between the forces of Utilitarianism and Deontology. Whatever its motives, a preoccupation with moral questions is the leading characteristic of contemporary philosophical interest in war.

The sense of paradox is scarcely less apparent in moral controversies concerning warfare than it is in those concerned with questions of law. Force is sometimes justified to defend the community against those who would destroy it, but its employment is seldom able to avoid the infliction of harm on those who have done nothing to deserve it. It is possible to distinguish two contrasting approaches to the resolution of moral dilemmas of this kind. One is to accept them as unresolvable, and to note that on certain questions at least no conclusive answer exists. The other is to insist that, properly qualified and interpreted, such dilemmas can always be resolved in terms of some higher principle; that morality is not a system of static ideals, but rather a way of resolving just such dilemmas of human action; and that while to apply moral principles in practice may involve making assumptions, these need not be arbitrary but, on the contrary, are required by morality to be rationally defensible. To those that are drawn to the first approach, the second will appear dogmatic; those drawn to the latter find the first nihilistic. Whereas the second approach must emphasize the capacity of reason to resolve moral dilemmas (as suggested by the very name "reason of state" for the principles according to which the

[9] Marshall Cohen, "Morality and the Laws of War," in *Philosophy, Morality, and International Affairs*, p. 86.

apparent contradictions between Christian morality and the requirements of the common good as protected by the state were at one time thought to be resolvable) the first is apt to criticize this approach, not as wrong, but as impossible. It looks upon moral reasoning as something that can only be done *within* a given morality, that is, according to an ordered collection of principles. Within the system, it is thought, one can proceed deductively from premise to conclusion; and indeed rationality in moral judgment means, on this view, being consistent in the application of one's basic principles when making judgments about particular cases. It is the choice between apparently incompatible systems of principles that cannot be rationally defended. The impulse here is to say that each captures an aspect of the truth, and reflects a certain moral attitude. Such at least is Thomas Nagel's conclusion with respect to the systems he labels "utilitarianism" and "absolutism": "We must face the pessimistic alternative that these two forms of moral intuition are not capable of being brought together into a single, coherent moral system. . . ."[10] The philosopher who has arrived at this conclusion is of little help in seeking to reconcile conflicting moral claims—although, if he is right, this is no defect of his position.

It is interesting that Nagel refers to a theory of moral obligation such as utilitarianism as a "form of moral intuition." Does he mean to suggest that although one can rationally apply utilitarian principles in making moral judgments there are no rational grounds for or against being a utilitarian? A number of other contributors to these volumes have evidently taken him as suggesting something of this kind, and have sought to defend their own conceptions of moral obligation as applied to war against the implied charge of dogmatism. I shall mention two such replies that reveal characteristic and important themes in contemporary analytical moral philosophy.

In defending a non-utilitarian approach to the morality of warfare, Jeffrie G. Murphy argues that certain kinds of judgments are constitutive of morality as such; they are what distinguish it from other systems of principles such as law or etiquette. They are not the sorts of judgments that admit of further justification: "No reasons can be given for why it is wrong to kill babies." And: "The person who cannot just *see* that there is something evil about killing babies could not, I suspect, be made to see anything else about morality."[11] Nagel's suggestion is pluralist in the sense that it simply points to the existence of distinct moral attitudes, identifies them as different forms of moral intuition, and allows that with respect to certain questions at least the different conclusions to which they lead must be accepted as reflecting a state of affairs that moral theory is unable to rectify. Murphy's examples, however, would seem to require a single comprehensive moral system capable of accommodating apparent contradictions.

What distinguishes Murphy's view from dogmatism is a definitional move according to which a judgment such as that it is wrong to kill the innocent is presented not as a moral *conclusion*, but rather as one of the premises of any reasoning that could be called moral. Principles like this one help to define what is to count as a moral judgment at all; as Murphy puts it, they explicate what may be called the moral point of view. Therefore, to insist upon such principles as "absolute" is only to insist upon their relevance for moral judgment, and not to claim that they can never be overridden. If something is a morally relevant consideration, then of course it must be taken into account in reaching moral judgments in situations where it applies. The function of ultimate moral principles is not to distinguish the moral from the immoral—that would be dogmatic—but to distinguish the moral from the nonmoral. Once we have grasped what are to count as moral considerations, we can proceed to engage in discursive reasoning in which we assign different degrees of priority to various principles and arrive at particular judgments. This does away with the problem of irreconcilable moral absolutes. On the other hand, by itself it also fails to generate any determinate moral conclusions at all, for what are now required are additional principles according to which we can decide how much weight is to be given to the different and doubtless conflicting principles that will arise when a particular case is looked at from the moral point of view.

The second reply to the kind of view represented by Nagel tries not only to reconcile conflicting moral principles but to do so in a way that sidesteps an a priori definition of moral relevance. As developed by Richard Brandt, it amounts to a rather straightforward application of John Rawls's rational contract theory of justice.[12] According to this theory, the principles of justice are those that rational persons seeking only to maximize their own interests would choose in an imaginary "original position." These are the basic principles according to which the constitutional rules for a society in which they will all live are in turn to be decided. In order to guarantee impartiality, they are not to know their future positions in such a society, and must thus be imagined to be choosing

[10] "War and Massacre," in *War and Moral Responsibility*, p. 23.

[11] "The Killing of the Innocent," in *Philosophy of War*, p. 536.

[12] "Utilitarianism and the Rules of War," in *War and Moral Responsibility*, pp. 46–61.

the basic principles from behind a "veil of ignorance." Applying this theory to the problem of identifying the principles of justice for war, Brandt has imaginary national representatives deciding, under similarly abstract conditions, upon rules for the future regulation of armed conflicts among states, should such conflicts occur. The point of this thought-experiment is to uncover a single coherent set of nonarbitrary moral principles of international violence—a set of principles, that is, which does not merely constitute one form of moral intuition among others, but the unique set that rational, impartial contractors would choose under the idealized conditions of the original position. As Brandt himself notes, this is roughly the question that national diplomatic representatives faced in negotiating the first codified laws of war at the Hague Conferences of 1899 and 1907 (although the requirements of the original position, especially that of the veil of ignorance, are imperfectly realized). The principles that Brandt derives are in fact remarkably similar to those underlying the laws of war as they presently exist, and include not only humanitarian restrictions that do not impair military efficiency but also certain restrictions that would entail military losses. Assuming such losses were not decisive for the outcome of the war, and could be presumed to be evenly distributed among possible participants in a future war, the acceptance of such restrictions would correspond to the long-run advantage of each state. And in fact the least well-regulated practices of war are those, such as the use of nuclear weapons or the tactics of guerrilla terrorism, that appear to possess military utility for just a few members of international society. Virtually all states, on the other hand, have an identical interest in having their prisoners humanely treated by the enemy and in preserving the possibility of truces and reliable communications with one another.

Whereas Rawls presents his theory as an alternative to utilitarian conceptions of justice, Brandt suggests (without really arguing the point) that the rules of war generated by an application of the original position to the problem of regulating international violence are those that utilitarian considerations of a certain kind (namely those of the "rule-utilitarianism" defended by Brandt in other contexts as a general theory of moral obligation) would support. The merits of this proposal cannot be examined here, but it is worth pointing out that a number of other essays reflect the ecumenical tendency of Brandt's analysis.[13] Several echo the conclusion urged by Kant in *Perpetual Peace* that a means cannot be evaluated only in terms of its proximate end; its employment has other consequences in the short and long run, including the restriction of future choices. Although usually taken as an inspiration for attacks on utilitarian conceptions of justice (as in Rawls's theory), Kant's criticism of political expediency can also be seen as being based on a perception of its incompatibility with long-run utility: he reminds us that although present actions are limited by necessity, they also create the necessities of the future. We must act justly now in order to encourage the growth of conditions that will allow us to act justly in the future. If this Kantian perspective is correct, then the gaps between what is reasonable, what is just, and what is prudent are not as great as one might think when initially confronted with the paradoxes of morality in the midst of violence. On the other hand, the scope of this conclusion, even if it is warranted, must not be exaggerated, for the conduct that might be regulated by public rules of war is by no means coextensive with the diversity of ways that human beings can affect one another in situations of war, nor are judgments of what is right and wrong by any means the only judgments people make that might count as moral judgments.

Legal and Moral Blame

There is, for example, a distinction between doing something wrong and doing something that is morally blameworthy. Following Machiavelli, one might suggest that there are times when to do wrong should be praised: when, for example, the leader who breaks the laws to protect the public good should be regarded as a hero rather than a scoundrel. Against the impulse to say that in such a case the act was not really wrong, all things considered, it may be argued that the various forms of moral judgment involved in such a case cannot all be reduced to a common standard, and that the person who does evil that good may come of it is guilty of a moral crime even if his act is justified. Perhaps, as Michael Walzer suggests, as political actors we become legally or morally blameworthy whenever we break the rules of the communities of which we are members, whatever our motives, and remain—like the civil disobedient—under an obligation to pay the penalty even when violation of the rules is justified by other—for example, utilitarian—considerations.[14] Whether or not one accepts this particular account of doing wrong and

[13] Especially R. M. Hare's "Rules of War and Moral Reasoning," in *War and Moral Responsibility*, pp. 46–61.

[14] "Political Action: The Problem of Dirty Hands," in *War and Moral Responsibility*, pp. 62–82. Walzer distinguishes this attitude toward the problem of doing evil that good may come of it from two others: the Machiavellian, which despite its rhetoric of paradox actually disposes of the problem by deciding that the end justifies the means, and the Weberian, according to which to act politically becomes the vocation of those who accept the necessity of doing evil and suffering guilt for the sake of others.

being blameworthy, to retain some such distinction is to permit inconsistencies between different forms of moral judgment that systematic theories in ethics have always sought to overcome. For to judge an act is not the same as to judge its agent, and in many situations of moral judgment—of which the incidents of war provide excellent, but by no means the only, examples—the various judgments that we make about act and agent do not necessarily reveal the application of a coherent set of basic principles.

What is involved here can be illustrated by considering the various responses one could make to a charge of wrongdoing—say of participating in the artillery bombardment of military targets which are located in built-up areas, and which cannot be destroyed without also causing substantial destruction of civilian lives and property. One might seek to defend such attacks on the grounds that they are not prohibited by the laws of war, or that it is not wrong to attempt to hinder the efforts of those who are engaged in the attempt to harm you or your community even if innocent people must thereby be made to suffer. By such arguments, the attempt is made to justify the act as right, or at least as "all right," through the appeal to some legal or moral rule that requires or at least permits it to be done, or by invoking the good results that are supposed to result from its commission. But a moment's reflection shows that even if such arguments are successful in justifying the attacks in question, they do not necessarily justify a particular individual's participation in them: he may, for example, have been motivated solely by hatred or by a desire for personal advancement. On the other hand, although the attacks may turn out to be unjustified, it does not necessarily follow that his participation in them was wrong, for he may have been doing his duty as he saw it; that a military act is wrong should not preclude recognition of the courage, selflessness, and other morally praiseworthy traits of some of those who participated in it. In thus seeking to justify the individual's participation in a wrongful act, we are likely to try to distinguish what *he* did from what was done, and to argue that the former at least was not wrong under the circumstances. He is not to be blamed, either because the attack in which he participated is not wrong or because his participation in it can be shown to be justified even if the attack itself is not.

Both of these responses to the charge of wrongdoing may be contrasted with a third form of defense, one that acknowledges the wrongfulness of the act, but argues that the agent is nevertheless not to be blamed. This is a defense that is often advanced on behalf of soldiers who have committed atrocities, and it naturally receives close attention in the books reviewed here. Instead of justifying the act, this form of defense seeks to excuse the agent. One way of trying to do this is to show that he cannot really be held responsible for the act or its consequences. People are sometimes excused from responsibility for acts that are due to some accident, mistake, or incapacity; in our example, the accused may have participated under duress or been kept in ignorance of the fact that in bombarding the enemy he was also harming noncombatants. In such cases we may be unable to identify any defect in the agent for which he could be blamed. Indeed, the event may scarcely qualify as his act; under certain circumstances it may be more truly represented as something that has happened to him rather than something he has done. Alternatively, there are situations in which an agent may be excused even though there is some defect that renders him responsible, at least in part, for what has happened, because of some standard that applies to the judgment of action in situations such as that in which his act was done.[15] The soldier is often unable to trust his own judgment against the consensus of his peers and superiors, or is so overcome with exhaustion, fear, or rage as to cause him to become momentarily indifferent or hostile to the welfare of innocent people he knows himself to be injuring. While independence of mind and rigid self-discipline are virtues, they are not ones an individual acting in such extreme and trying circumstances can reasonably be expected to display. It would be wrong, so the argument goes, to blame him for succumbing to pressures that only an exceptional individual could resist. In contrast to the first sort of excuse, which qualifies the extent to which a given act can properly be said to have been done by the agent, excuses of the second kind qualify the extent to which an agent is properly censurable. To excuse in this sense is to try to show that his act does not fall below the standards applicable to a particular situation because anyone, or almost anyone, would have acted as he did under the circumstances. We might praise the exceptions, but cannot regard such exceptional behavior as obligatory.

Such judgments are influenced by the fact that the acts of international violence we criticize, justify, or excuse are often collective acts and their agents often collective agents.[16] It is not only that judgments of acts and agents must recognize that in war individual action occurs in a collective context that transforms the significance of elementary acts like killing, and places new and different constraints upon human behavior. Equally

[15] Peter A. French, "Morally Blaming Whole Populations," in *Philosophy, Morality, and International Affairs*, p. 273.

[16] See the volume of essays on this topic edited by Peter A. French, *Individual and Collective Responsibility*, as well as his essay cited above.

important, and usually more puzzling, are the issues raised by the actions *of* collectives. Can "acts" be ascribed to collectives? Are there "collective agents" that can be held morally or legally responsible for wrongdoing? Both the traditional doctrine of the just war and the Nuremberg charge of "waging aggressive war" which we have seen contrasted in theories of moral obligation appear, in the context of discussions of blame, to share a common framework of assumptions about collective action: in both, war is an act which can be judged in terms of conceptions of responsibility, blame, excuse and other categories of individual action. As has often been observed (for example, by defenders of "methodological individualism") this way of conceptualizing collective action encounters difficulties insofar as it seeks to present a descriptive or causal account of complex human interactions. Even so, we might still wish to retain such conceptions for the purposes of moral and legal judgment. For example, we might—as is done in making the charge of criminal conspiracy—wish to blame particular individuals for the acts of other members of a common collective, or to distribute blame for a collective act over many individual participants in it, each of whom made only a partial contribution to its completion.

Despite the complexity of the issues involved, questions of responsibility and blame raised by acts that are the outcome of organized collective processes are in fact among the more easily defined and intelligibly discussed aspects of the subject of collective responsibility. It is in connection with such organized collective acts that relatively definite, if objectionable, legal principles such as superior orders, command responsibility, and criminal conspiracy have been articulated and applied; here, at least, is grist for the philosophical critic's mill. But situations of organized collective action do not exhaust the possibilities for ascriptions of collective responsibility for acts of international violence, as is suggested by the common opinion that Germans in general were responsible for the crimes of the Nazis, or that Americans in general should be blamed for the atrocious acts of members of the United States armed forces in Indochina. Here we enter an area of thought in which legal principles are virtually nonexistent and moral notions primitive, unarticulated, and confused. Yet even those who reject the notion that all members of large and loosely defined collectives can be held responsible for such acts might allow the need for a conception of moral responsibility applicable to a wider circle of persons than those involved in some immediate and recognized way. How should the boundaries of the *unorganized* collectives whose members are jointly responsible for a particular act or outcome be delimited? According to one suggestion, collective moral responsibility is properly ascribed to all those who would be willing to participate in the act if they were placed in the same circumstances as those who did actually perform it.[17] According to another, it is the members of the class of those who should have constituted themselves into an organized group and sought to prevent its occurrence that are morally responsible.[18] What such suggestions have in common is the aim of identifying the elements that would justify blaming some and excusing other members of an unorganized collective linked with wrongful violence. There seems, however, to be a confusion in these accounts between whether people are to be blamed for the violence itself or for the fault of falling short of other standards, such as those requiring that they not be willing to participate in such acts or even that they actively oppose their commission. Further analysis of the related concepts of responsibility, blame, fault, liability, culpability, and guilt, together with explorations of the applicability of principles such as negligence or vicarious liability borrowed from civil and criminal law, might contribute to the clarification of the obscurities surrounding the notion of collective responsibility. Yet such an approach also has its limits. In particular it is no substitute for inquiry explicitly aimed at clarifying those moral obligations of citizens that are presupposed by various conceptions of responsibility. These are in part obligations derived from standards of citizenship, and therefore perhaps more progress would be made if collective responsibility were to be understood in this way, as a problem of political philosophy, and not approached through the back door as an appendage to the problem of allocating blame for past horrors. It is just because they are so closely connected that blame cannot be profitably studied apart from the study of those standards of law and public morality from which our obligations as members of collectives are derived.

The Interdependence of Descriptions and Judgments

Judgments of violence may be influenced by the terms in which the acts to be judged are described and interpreted. To call an act a "reprisal" or an "accident" is not only to identify but also to describe it in terms that imply some evaluation of it. The outcome of such evaluations will often depend upon which description of the act is accepted as the "correct" description. There is thus an interaction between descriptions of acts of violence and judgments of them. Certain excuses, for example,

[17] Haskell Fain, "Some Moral Infirmities of Justice," in *Individual and Collective Responsibility*, p. 32.

[18] Virginia Held, "Moral Responsibility and Collective Action," in *Individual and Collective Responsibility*, p. 115.

apply descriptions that in some way question the "actness" of the violence for which a defense is being offered. They describe the violence as something other than the agent's act, as something that happened to him rather than something he did, or as not exactly what he did because in fact he was really doing something else. Other descriptions dispute the wrongness of the act, emphasizing features of it that would tend to justify rather than accuse: he was simply "obeying orders" or "defending himself." In this way, disagreeable forms of violence are assimilated to more acceptable categories of action; conversely, if one's objective is to criticize, then acts favorably described may be redescribed in terms that suggest their unacceptability. Because one so often encounters alternative descriptions having different implications for legal and moral judgment, one must understand the various forms of act-description used in talking about international violence, as well as the criteria according to which the limits of permissible descriptions are drawn.[19]

Because the description we apply to an act can affect our judgment of it, there must be some way to winnow descriptions that are correct, relevant, or appropriate from those that are not. To vary a familiar sort of example: a man firing in combat may be said to be clearing a landing zone, obeying orders, wasting ammunition, defending his country, overtaxing his heart, and violating the laws of war—all at the same time. Depending upon the context, we may select out one or more such descriptions to characterize his act. Some acts have a significance according to a social rule that provides the criterion for their identification as an act of a certain kind, according to which—for example—moving two pieces of ivory in a certain way across a patterned board counts as "castling," or entering another's house at night with the intent to commit a felony constitutes "burglary." In other cases, an observer may provide the description appropriate to his particular interests or responsibilities: the field commander, quartermaster, medical specialist, and military lawyer each have a professional perspective on acts like firing in combat according to which different descriptions become relevant. The description may also involve the interests and intentions of the agent himself: we have not got it quite right when we describe a terrorist taking a letter-bomb to the post office as just "mailing a letter." These differences of interpretation arise in part because what we call acts are constructed of other acts related to each other in various ways. One act may constitute a temporal phase of another, more extended, act (as running the first lap is one phase of running a race). Or the act may be a species of a more inclusive genus (reading Locke's *Second Treatise*, as opposed to just reading), or a means to an end (breaking eggs in making an omelet).

Of particular significance for judging acts of violence is the relation between an act and its consequences, for often instead of criticizing or defending an act by pointing to its consequences, we may judge the act indirectly by characterizing it in terms of those consequences. If I observe a person (A) firing a gun at another person (B), who is in turn about to kill a third (C), what I have observed is a chain of acts and consequences involving, among other things, the tensing of a finger on a trigger, the functioning of a trigger mechanism, the detonation of a gunpowder charge in a cartridge, the propulsion of a bullet out of the barrel of the gun, the impact of the bullet on its victim, his death, etc. One description of the act that might be made is to say that the person firing the gun killed another person (that is, that A killed B). Another, more favorable to the agent, is that he saved a third person's life (A saved C). If one feels inclined to protest that the latter description is not really a description of the act proper, but rather an attempt to justify it by appealing in a veiled way to its (putatively) good consequences, he should be prepared to answer the argument that the description "A killed B" is not really a description of the act proper, either, for what really happened was that A fired a gun, with the consequence that B was killed. Or that A tensed his finger, with the consequence that the gun went off—etc. And once one embarks on a train of reasoning of this kind, it becomes possible to discover many different act-descriptions, many different ways of dividing a series of events into "act" and "consequences." Hence the need for rules according to which some ways of making the division will override others that might in another context prove decisive. It is because we are applying such a rule that we judge, in the preceding example, that the formulation "A killed B" constitutes the appropriate description of what happened. Which rule is to be applied depends upon the context of judgment. Thus although the interests of various observers might result in divergent descriptions of an act for which someone is being tried in a court of law, it is the description arrived at by the court applying legal categories and principles that is "correct" in that context, and not those possibly favored by plaintiff, defendant, or spectators. Similarly, moral rules place limits on the freedom with which the acts judged according to them can be described.

The application of these distinctions to judg-

[19] This problem is explicitly considered by two contributors to *Philosophy, Morality, and International Affairs*: Joseph Margolis, "War and Ideology," pp. 246–265, and Kai Nielsen, "Social Science and American Foreign Policy," pp. 286–319. It is, however, implicit in each of the controversies we have examined, as I hope will soon become apparent.

ments of international violence is well illustrated by the problem, raised in many of these essays, of distinguishing legitimate killing in war from murder.[20] War involves the killing of innocent people, but it would be mistaken to regard all innocent deaths as murder; the problem is to distinguish those that are appropriately described as murders or war crimes from those that are not. Clearly it is no solution to this problem to describe an act involving the deaths of innocent persons in terms of its other consequences, intended or actual, that are more defensible and according to which the deaths of innocents might be justified. The relevant distinction, it has been suggested, is between deliberately bringing about the deaths of innocent persons either as an end in itself or as a means to an end, and acting in such a way in the pursuit of a legitimate end that innocent people suffer injury and death as an incidental and undesired side effect. It is on the basis of this distinction that one can understand the moral difference between, let us say, participation in precision bombing attacks on German operated railways in northern France prior to the Normandy invasion, in which the deaths of French civilians occurred and could be foreseen, and participation in the obliteration bombing of German cities with the express purpose of demoralizing their civilian inhabitants. In the first case one could say that to participate is not to murder (that is, deliberately kill) civilians, for doing so constitutes neither the purpose of the attacks nor a means to the realization of their purpose. But the infliction of injury and death upon civilians is, in the second case, if not the main purpose of the attacks at least a necessary means to the end of undermining civilian morale. To describe both attacks as attempts to weaken German military resistance is not mistaken, but it is a description that hides a legally and morally relevant distinction between alternative means to this end. Causally speaking, the participant in one form of attack is in the same relationship to the deaths accompanying it as the participant in the other; if we excuse or justify the first and blame the second, it is on the basis of criteria that require the two acts to be described in such a way as to permit the relevant distinction between them to be made.

[20] See the essays by Ford, Anscombe, Nagel, and Murphy already cited.

The problem of act-descriptions also has implications for inquiry aimed at the explanation of international violence. Like legal and moral judgments, the explanatory accounts devised by historians and social scientists are influenced by the descriptions employed in the interpretation of the phenomena that they seek to explain. Here both doctrines of method and substantive theories provide the source of criteria for choosing among alternative descriptions, and those in turn often reflect the application of distinctions derived from legal and moral discourse. Often, of course, the observer is insufficiently aware of this fact, and in selecting or in simply using without question a particular set of descriptions he may be unwittingly engaged in the perpetuation of judgments embedded in them. The analysis and criticism of explanatory theories of international violence would therefore appear to constitute an interesting and fruitful field for philosophical inquiry, one as deserving of attention as the study of its legal and moral dimensions. Yet this aspect of the subject is almost entirely overlooked by the contributors to these volumes.[21]

A rich diversity of questions, both cultivated and neglected, thus awaits those who are drawn to explore the regions in which philosophy, war, and international politics are joined. The body of work we have considered here provides both a reconnaissance of these regions and some tools for further exploration. Yet we shouldn't forget that the subject has been investigated for centuries, and that new tools alone are unlikely to produce significant results. Like other ways of thought, those of the analytical philosopher are sometimes unimaginatively exercised upon ill-chosen problems, with negligible results. Discernment is necessary in the choice of lines of inquiry, and in the study of international politics this requires an appreciation of history, institutions, and the empirical substance of policy. The philosophy of war and international politics presented in these volumes is interesting precisely because it does combine analytical skill with substantive knowledge to a degree unusual in recent philosophical commentary on the subject.

BOOK REVIEWS

Montesquieu's Philosophy of Liberalism: A Commentary on *The Spirit of the Laws*. By Thomas L. Pangle. (Chicago: The University of Chicago Press, 1973. Pp. 336. $10.00.)

The Spirit of the Laws is a puzzle. Its organization and its purpose have been as great a mystery as some parts of it have been clear. Thomas Pangle proposes an answer: Montesquieu is a liberal who advocated the establishment of commercial republics, as far as circumstances permit. Montesquieu's book is a gradual unfolding of that teaching. In Part One, according to Professor Pangle, Montesquieu exposes the inadequacy of the traditional regimes, among which the small republic based on virtue and equality is the most attractive. In Part Two, Montesquieu proposes liberal republicanism, based on freedom as the guarantor of the security of the individual. This proposal, Pangle argues, is grounded in Montesquieu's view of the English regime. In Part Three, Montesquieu examines the natural difficulties and facilitating aspects of climate and terrain. Pangle says this argument moves Montesquieu perilously close to modern historicism and sociology. Part Four pursues a description of modern commerce and its advantages, and the possibilities it creates for the arts and for legislation, if not philosophy. Religion is argued to be essentially different from politics and Christian natural law is argued to be pernicious for politics. In his final chapter, Pangle considers Books 26 and 29 and the final books on France. These form the concluding discussion of natural law and legislation. The political purpose of freedom, expressed as the moderation of the legislator, must find its way between the low universals of the natural law and the peculiar circumstances of any particular polity. France is

This view of *The Spirit of the Laws* is persuasive because it takes into account the depth of because it takes into account the depth of Montesquieu's understanding of the political alternatives, particularly liberalism, exemplified by the English commerical republic. However, the political and intellectual climate in which Montesquieu lived and wrote was not one of unrelenting censorship of admiration for England, particularly its commerce, or of great distrust of modern philosophy. Rather, provided a formal respect was paid the king and the church, the situation was the opposite. French admiration for England was increasing, and, as Rousseau was soon to note, the intolerance of the Enlightenment for any but its own rivaled that of the Church. In view of this situation, Montesquieu's reticence about England could easily have had as much to do with the enthusiasm of England's followers as his fear of having the authorities think he joined them.

One must, therefore, be careful about Montesquieu's treatment of the ancients. Pangle complains that Montesquieu treats Plato's *Republic* and *Laws* as "serious practical proposals" (p. 65), implying that such treatment could never have been that of the ancients. Montesquieu follows Aristotle's lead in Book II of the *Politics* in this. Similarly, Pangle complains that Montesquieu lowers music from the peak of the citizen's education (p. 65). The clearest teaching of the *Republic,* however, is that music and gymnastic together were to establish a balance within the souls of the guardians. Montesquieu says that music aroused something in the spirit of the citizens other than the political virtue of dedication to their common existence (Bk. 4, ch. 8) which did not lead to the savagery of the speculative sciences. That the place of music was intermediate between philosophy and political life understood as common existence, and even that philosophy is not easily domesticated to political life—these ideas are not clearly outside Plato's understanding. If Montesquieu needs to be as subtle about his view of the ancients as of the moderns, these passages, which lead Pangle to see a radical distinction between Montesquieu and the ancients, do not lead easily to that conclusion.

Pangle's treatment of monarchies is as questionable. Monarchy, as Montesquieu describes it, is a curious regime, characterized not by its ruler, the monarch, but by the honor of the nobility. This structural difference between regimes is pointed out again by Montesquieu's emphasis on the size of monarchies (Bk. 8, chs. 16-20). Montesquieu repeatedly refers his reader back to these chapters. Monarchies are essentially different from republics, democratic or aristocratic, and from despotisms. Montesquieu, then, has not set up the regimes of Part One as a simple alternative to the liberal republicanism of Part Two. Rather, he has proposed some different regimes which the reader must pursue through *The Spirit of the Laws* in order to grasp the spirit of those distinctions and of yet another regime.

Although I would neither begin as Pangle did, nor proceed in his manner in a consideration of the *Spirit of the Laws,* his book is fascinating to read. It is the sort of book one reads arguing every step of the way, but emerging with a much

clearer understanding of what the questions in Montesquieu are and how one ought to understand him. This is because he takes Montesquieu's interest in politics and its improvement seriously and follows Montesquieu's argument as he sees it through *The Spirit of the Laws*. I would advise anyone interested in our liberal republican regime or in Montesquieu to read this book and to pursue the argument grounded in the text and in serious political questions where Pangle put it and where it belongs.

ANNE M. COHLER

Chicago, Illinois

Bentham's Political Thought. Edited by Bhiku Parekh. (New York: Barnes & Noble division of Harper & Row, 1973. Pp. 340. $15.00, cloth; $4.95, paper.)

Bentham scholars will welcome this book because the 280 pages of extracts that it contains (arranged by the editor in twenty-two chapters and five appendices) make available some material that has not yet been printed in the volumes so far published of the definitive edition of Bentham's writings that is being prepared by the Bentham Project housed at University College, London. They will also welcome it because, in the previously published work that is included, not only are the tamperings of the earliest editors avoided, but in addition, some of the transcriptions of more recent editors are amended. They will be interested, too, in the rationale of the selection procedure adopted that is given by the editor in his short (37-page) preface and introduction. They may ask themselves, however, whether Dr. Parekh has not perhaps rather over-trimmed Bentham's thought in order to fit it into his own conception, stated in the preface, of "what is expected in a work on political philosophy" (p. 7). As applied to Bentham, this involves starting with an ontology, proceeding to a theory of man, and, in particular, the place in this theory of pleasure and pain, moving next to analysis of key political concepts, then to an account of ideal political society, and finally to a discussion of the nature of political argument. Bentham scholars are likely, too, to wish that Dr. Parekh had given fuller references in his introduction which would have guided them to all the parts of the extracts on which the main points in his exposition of Bentham's political thought are based.

A degree of unease may also occur when one notices that the editor gives few indications in the introduction or elsewhere of changes in Bentham's positions, apart from rather general allusions to his earlier nonradical and late radical standpoints. Since in most cases the dates of the various extracts are to be found in footnotes, the unwary reader might be led to suppose that, except on radicalism, Bentham's positions remained unchanged from 1773 to 1829. The very unwary reader might be even more misled by an odd lapse on the part of the editor when he says in his preliminary note to the extracts presented in Chapter 2 (p. 51): "Having examined the nature of fictitious entities in the previous chapter he [Bentham] now goes on to develop a technique of analysing them by relating them to some real entities." The previous chapter (which, of course, is the editor's chapter, not Bentham's) consists of extracts, for which dates are not given, from mss. U.C.L. box 102, and Chapter 2 consists of extracts from mss. U.C.L. box 101, written in 1814, 1826 and 1813, (p. 330, chap. 1 note 1, chap. 2 note 1).

In his preface Dr. Parekh says, "If the book gives a reasonably coherent account of Bentham's political philosophy and inspires students of Bentham to go to the original works, the labour will not have been in vain" (p. 11). But it is clear that the book is not at all suitable for unaided beginners and that it will be useful for students only if they are given considerable guidance. The preface and introduction, indeed, assume previous knowledge of Bentham (including acquaintance with the significance of "Panopticon"), and little there or in the notes links Bentham with earlier and later thinkers. There are some passages in which Bentham's views are set out in relation to those of others, but they are unlikely to help the beginner very much. At least one passage will seem distinctly puzzling in its reference to "the classical liberalism of Hobbes and especially of Locke" (p. 42), unless the reader is already familiar with some other literature, such as Dr. Parekh's own contribution "Liberalism and Morality" in *The Morality of Politics* the collection that he edited with R. N. Berki. (London: Allen & Unwin, 1972).

Nonetheless, it is useful to have the various extracts together in one volume, and the introduction, short as it is, does draw attention to certain themes in Bentham that do not appear to have been emphasized by others, especially Bentham's elaboration of the rendering of services as a central feature of his theory of government, and his treatment of the power of the sovereign in terms of the sovereign's dependence upon the extent of a disposition to obedience on the part of subjects. The last point, however, might well have led to a consideration of yet another interesting theme, Bentham's discussion of indirect legislation; unfortunately that topic is not touched on.

It should be mentioned, however, that *Ben-*

tham's Political Thought is not to stand alone. The publishers announce on the jacket that Dr. Parekh "is currently working on a critical study of Bentham," and therefore some of the gaps I have mentioned may be filled by that work. If they are, then Bentham scholars will be better placed to assess the interpretation that is summarized in the present volume.

WILFRID HARRISON
University of Warwick, England

Dynamische Demokratie: Zur konkreten Utopie gesellschaftlicher Gleichheit. By Anton Pelinka. (Stuttgart/Berlin/Köln/Mainz: Verlag W. Kohlhammer, 1974. Pp. 148. DM 18.80.)

Anton Pelinka, professor of political science at the recently founded *Gesamthochschule* at Essen, says in his new book, *Dynamic Democracy*, that he is primarily concerned with the process of democratization, from the perspective of what he labels "dynamic democracy" (p. 7). From his discussion of the relation between societal and political practice, Pelinka also arrives at a model of democracy.

He curtly dismisses the political conceptions of democracy set forth by Locke, Montesquieu, the authors of the *Federalist Papers*, and Rousseau and the juristic conception set forth by Carl Schmitt because, he claims, they are based on abstract postulates. He finds himself in partial agreement with the thought of Robert Michels, Vilfredo Pareto, Gaetano Mosca, Joseph Schumpeter, Anthony Downs, Gabriel Almond, Sidney Verba, and Robert Dahl, among others. He compliments these writers for focusing on the actual practices of democracies, but is, nevertheless, ultimately disappointed with the writings of Michels, Pareto, Mosca, Schumpeter, and Downs because, he says, they see "democracy" only as a "method," a "procedure" devoid of specific content (p. 15). But Pelinka welcomes the dynamic element inherent in the notion of active "political participation" as developed by Almond, Verba, and Dahl, though here too he laments the absence of a definite content (p. 18).

One may thus understand why Pelinka thrusts to the forefront those who have ascribed to the concept of "democracy" a norm he considers to be positive (e.g., Peter Bachrach—no mention is made of John Rawls and Christopher Jencks). For Pelinka, a dynamic democracy is, first of all, an operational procedure. As such it is in a constant state of flux, and in a constant state of development perpetually attempting to draw ever more people into the democratic process (p. 116). Equality and freedom are the goals. In the words of the author:

> Democracy is the realization of as equal a measure of freedom for all as possible. Freedom and equality are not opposites. Equality is nevertheless the variable quantity, which in its entirety can be maximized and also minimized. Equality is the concrete, the real utopia of dynamic democracy. It is utopia because its complete realization cannot be anticipated in the foreseeable future. And it is concrete and real because a given society can be judged according to the extent to which it has achieved partial equality; and because this observable measure of equality can be intensified in the direction of utopia, of total equality of power (p. 74).

Pelinka's discussion of both the process of moving toward the goal and the end product itself reveals one of his fundamental assumptions, namely, that man is now more or less rational and that in the course of history he will develop into an almost or even fully rational being. In this context one may understand Pelinka's argument that in the developmental process toward the hoped-for goal, power has to be made ever more "visible," "measurable" (p. 40), and "controllable" (p. 42), until it need no longer be based on "coercion" (p. 43). To achieve this diffusion of power, the author hopes, at least implicitly, to help the course of history along by educating man politically (pp. 101-102).

Pelinka's discussion gives rise to many questions, including the injecting into politics of an ideology considered to be true and absolute. But his fundamental weakness is his failure to integrate his conception of a developing democracy into the actual world of political reality, i.e., into the framework of a politically pluralist world.

Pelinka is silent on how a dynamic democracy, in the process of developing, can and should cope with political emergencies, whether internal or external. He does not solve anything by merely stating that a dynamic democracy in the process of developing is not only cognizant of, but also encourages conflict, and then equating conflict with domestic unrest (p. 57). What if such unrest were to become so sharp that a distinction must instantly be drawn between friend and foe? In a society in which political power is constantly divided, subdivided, and torn asunder, who will decide that an emergency exists? Who decides how it is to be resolved? Does this sort of developing democracy make any provision for emergency situations, and hence for emergency legislation to which individuals can be forced to conform?

Had Pelinka not skirted fundamental questions, his otherwise interesting discussion would not have been left hanging in the air. In the construction of a political system whose starting point is the actual world, reality must not and can not simply be ignored and wished away.

The City University of New York

The Nature of Human Values. By Milton Rokeach. (New York: The Free Press, 1973. Pp. 438. $13.95.)

It is the business of political (and other) philosophy to explicate the nature of values, to contrast them to each other, to argue the case for some preferred set, and to relate these to the practices of institutions and societies. Some portion of this work could be expanded and, I think, improved, if we had some way of finding out who has what values, what behaviors follow from holding some set of values as contrasted to another, how values change, and how societies and social groups differ in their value preferences. The study of ideology, of public opinion, of electoral behavior, of decision making would similarly gain. (Of course the question of which values *should* be preferred is properly a philosophical question, although the cost/benefit problem is also a social scientific one.) In *The Nature of Human Values,* Professor Rokeach has come forward with a measure of values and some interesting, provocative research.

The concept of value is elusive: should it be divided between concepts of the desired and of the desirable, as Clyde Kluckhohn has argued? Rokeach says "no" because the desirable is "nothing more than a special kind of preference" (p. 11). Is it another word for "need," or can needs be translated into values, as Robert White has argued? Rokeach says they are by no means the same, for if they were the same, rats would have values; rather values are cognitive representations of needs. A value is not an attitude, for attitudes require objects or situations, and values do not. Values are more flexible than traits; they subsume interests. Thus, "A value is an enduring belief that a specific mode of conduct or end-state existence is personally or socially preferable to an opposite or converse mode of conduct or end-state of existence" (p. 5). It is enduring (but Rokeach can manipulate them), it is a belief (true-false, good-bad, and also prescriptive), and is to be divided into "modes of conduct" (instrumental) and end-states of existence (terminal).

The measurement or identification of values has always run into the problem of method; basically there are two: (1) ask people directly, (2) infer from behavior or expression, oral or written, the underlying value informing these expressive acts. Rokeach adopts the first of these. After wide scanning of many lists (but not Lasswell's) Rokeach develops his own list of 18 terminal values (a comfortable life, a world at peace, equality, freedom, inner harmony, etc.) and 18 instrumental values (ambitious, clean, forgiving, polite, intellectual, self-controlled, etc.). He presents these lists to his respondents and asks them to rank them. Test-retest reliabilities on the final form among different samples are .74 on the terminal values, and between .65 and .70 for the instrumental values. The validity is a different matter; in general, Rokeach's measure predicts not only attitudes but also behavior, and the relevant values are modestly correlated (.25 to .35) to McClelland's measurements of need. After some initial skepticism, I am persuaded by the research findings of those who have used the instrument that it is sufficiently valid to become a useful tool in an area that desperately needs one.

What does Rokeach find out? In a national survey he discovers that Americans (in 1968) value most "a world at peace, family security, freedom" and value least "pleasure, social recognition (!), and a world of beauty." They want people to be honest, but are indifferent about their being intellectual or logical. Three years later (see *Public Opinion Quarterly,* Summer, 1974) the valuation of "a comfortable life" and of being "clean" had declined, while "equality" and "a world of beauty" had increased, but there had been a general stability over that short time period. Since values are both elements of personality and reflections of social norms, information on the sources and content of change—about which much vapid material is written—may be one useful advantage of Rokeach's measure.

By social class: in the working class, compared to the middle class, there is no evidence of a Banfield-type culture of poverty (hedonism or present-time orientation), but there is much more conformism and religiosity. With income controlled, blacks show generally the same pattern as whites, except for their higher valuation of equality. There is no special black culture—so far as Rokeach's values go. By age: as one matures, "loving," "a world of beauty" and hedonism decline; "self-realization" values are highest in the college years. By political party there is no difference, but by candidate preference the ranking of "equality," from low to high, is as follows: Republican candidate supporters generally, McGovern supporters, then Kennedy/Johnson supporters. (More trouble for the interpreters of McGovern support.)

But the excitement in this study lies elsewhere. Two chapters on ideology find first that a thematic content analysis focussing on the two values that Rokeach believes to be most relevant—freedom and equality—in the writings of Lenin, socialist humanists, Goldwater, and Hitler, reveals a neat pattern: Lenin is high on equality and low on freedom, Goldwater is high on freedom and low on equality, Hitler is low on both, the socialist humanists are high on both, and these differences are such that the evalua-

tions of these concepts are at the poles of their value scales. Students who themselves have these relative value patterns reveal, through a variety of questions to test their ideologies and identifications, that such value preferences predict (determine?) ideological preferences. The "socialist" value types (high on both freedom and equality) are most "accurate" in their perceptions of the ideological implications of these values. "Communist" value types (high on equality and low on freedom—a small group) do prefer Communist symbols, slogans, personalities more than others, but they prefer fascist symbols even more. This anomaly, if that is what it is, is interpreted by Rokeach as reflecting a common misperception of ideology which limits it to one dimension on which all four ideological types are ranked, rather than the two dimensions he finds actually describe them better. Further, he discovers a "law of activism": extreme (high or low) valuation of freedom or equality is a necessary condition for sustained political activism.

The values can be manipulated rather easily: a casual mention to those who ranked freedom high and equality low, to the effect that they might be interested in freedom only for themselves, induced changes in attitudes and such behaviors as joining new civil rights groups and changing careers. The finding disturbs Rokeach, as it does me.

In spite of some methodological imperialism, the book and method illuminate some dark corners of politics, even if they do not light up the sky. We will be hearing more about Rokeach's value measure.

ROBERT E. LANE
Yale University

The Heirs of Stalin. Dissidence and The Soviet Regime, 1953-1970. Edited by Abraham Rothberg. (Ithaca and New York: Cornell University Press, 1972. Pp. 450. $14.50.)

As the title indicates, the book deals with that phenomenon in Soviet society which is now commonly though inaccurately designated in the West as "dissidence," while the parallel term in the Soviet Union is *inakomyslie* or "another way of thinking." One of the most prominent "dissidents" and a highly qualified scientist, Dr. Khodorovich, recently protested in one of her *samizdat* essays against the term as a politically loaded misnomer. The term, she wrote, presupposes those who think in one way and those who think otherwise. But in fact *samizdat* today is the only forum of thought in the USSR, for thought cannot develop when it is subordinate to dictates of an ideology which has lost all credence, dictates of a dead ideology. Two types of thought presuppose a real or implied dialogue between them, but what dialogue can there be between two chess-players, continues Mrs. Khodorovich, when one chess-player, every time he loses a figure, mops all the adversary's figures physically off the board.

Although the above generalization can be somewhat questioned, for in the field of, say, mathematical and natural sciences, advances in thought can (after the fall of Lysenko) be expressed in the official press; some original writing can still be found in *Novy mir* and other literary publications, and historians can write quite truthfully about the less controversial and more distant topics of historiography and get their findings published. But on the whole, particularly in the spheres of *Weltanschauung*, philosophy, religion, social and political thinking, Dr. Khodorovich's statement is correct. Furthermore, when one speaks to the so-called "dissidents" recently arrived in the West, one discovers that most of the more original historians, scientists and literary figures who continue to have their works published in the official press are personal friends of many of the well-known "dissidents." In other words, they are the "silent majority" of the so-called "dissidence" and potential *samizdatchiks* themselves. In fact, despite the increased pressures and more severe punishments, with every departure to the West and with every new arrest there appear in the Soviet *samizdat* new names to replace those who left; e.g., the Moscow-based mathematician, member of the Armenian Academy of Sciences, Yurii Orlov, the writers V. Kornilov, Voinovich, etc.

Mr. Rothberg's book itself should convince the Western Sovietologist how far behind the times he is in his continued concentration on the official Soviet press and his almost total disregard for *samizdat*, hypnotized by the quantitative disproportions between the two and by the external weight of Soviet foreign policies. Western intellectuals seem to ignore their own intellectual cradle of individualism and minority opinion.

Unfortunately, *The Heirs of Stalin* is a predominantly descriptive work, and not an analytical one. His chapters are individual case descriptions, either of individual "dissident" personalities or of fates of individual "controversial" works of art. There are extensive quotations. Documents and relevant writings are cited, much conscientious footnoting is done. So, the book leaves no doubt as to its realiability and factual accuracy. But there are no serious attempts at conceptualization, at an analysis of the whole phenomenon of "dissent" and "samizdat," no real thread or connection between the individual chapters and cases individually cited, stated, and

even analyzed to some extent. Consequently, the reader is left with fragmentary impressions, with considerable information on individual cases, but no appreciation of the whole post-Stalin development of Soviet society. Even if Mr. Rothberg had only reproduced Siniavsky's "On Socialist Realism" and some parts of his *Trial Begins* he would have given the reader a much more synthesized and overall understanding of Soviet society since 1953, than by all his fragmented chapters, which on their own only serve as an excellent illustration. But of what? Of Siniavsky's thesis (written as early as 1956-57) that ever since the death of Stalin, "we have entered a cycle of destructions and reassessments" (*Fantasticheskii mir Abrama Tertza,* New York, 1966, p. 455).

One could question the author's method of subdividing the book into "professional" sections: "Artistic Dissidence," "Political Dissidence," "Scientific Dissidence." Much more representative subdivisions would be according to schools of thought; e.g., "Neo-Marxism," "Neo-Slavophilism," "Neo-Liberalism," "Christian-Socialism," "Democratic Socialism" "Neo-Fascism," etc.; for one finds scientists as well as artists among all these ideational groupings and trends, while divisions by professions are just as artificial as the Marxist attempts to squeeze schools and trends of thought into frames of class origins.

There are some minor errors and misspellings of names (such as on pp. 174, 177, 185, 190, 210, 214, and elsewhere), some repetitions, some misleading labels of "liberal," "dogmatist," "more liberal," slapped on individual Soviet literary *apparatchiks* and other "with-it" figures. Why, for instance, is the super-subservient literary *apparatchik* S. Mikhalkov claimed to be more liberal than a similar *apparatchik,* G. Markov (p. 141)? Both have become "famous" in their campaign against Solzhenitsyn in the period from 1969 to 1974, and both now occupy key positions in the Writers' Union.

Nevertheless, it should be repeated, the book is a very valuable "first" in the English language on the "unofficial" or "unapproved" part of the post-Stalin Soviet intelligentsia and society and should be widely read and popularized in the ranks of thoughtful Western readers.

D. Pospielovsky
The University of Western Ontario

Science and Politics. By Jean-Jacques Salomon. (Cambridge, Mass.: The MIT Press, 1973. Pp. 277. $15.00.)

At least until the Second World War, the history of the relations between science and politics was represented often as the story of the struggle between the forces of reason and unreason. The atomic blasts at the end of World War II blurred the distinction by making science appear as both a more credible instrument of public policy and a less credible contributor to the promotion of rationality in public affairs. During the 'fifties and 'sixties, as the growing role of science in public affairs was increasingly accepted as a fact, the questions which were raised centered less on whether science should enter the political domain than on how this process, which was regarded as inevitable, should be effected without the politicization of science or the delegitimation of politics.

As a question bearing not only on the mechanics of government but also on the nation's deepest values and commitments, the relations between truth and power have remained a favorite theme for the philosophers, moralists, ideologists, martyrs and seers of the age. Don K. Price, moving from government to academia, was perhaps the first to treat the question about the place of science in democratic politics systematically (in *Government and Science* [New York: New York University Press, 1954] and *The Scientific Estate* [Cambridge, Mass.: Harvard University Press, 1965]). Even though Price was concerned primarily with defining an American solution to this problem, his book raised some fundamental theoretical questions whose significance for understanding the relations of science and politics goes beyond the specific contingencies of the American system.

This promising beginning, however, remained without a follow-up. By and large the wealth of accumulating historical material in this field has not been subject to conceptual regimentation and has not been illuminated by ongoing theoretical discourse. Instead the preoccupation with the subject has given rise on the one hand to moral and ideological literature on the social responsibilities of scientists and the obligations of the state to science and, on the other hand, to pragmatic literature on questions of science policy.

Salomon's book has not altered this intellectual landscape. In combining a discussion of the practical problems of science policy with a discussion of the responsibility of scientists in politics, it is in fact fairly representative of much of the literature which has evolved around this subject since World War II. A long-time participant-observer from his strategic position as head of the Science Policy Division of the Organization for Economic Cooperation and Development (OECD) in Paris, Salomon tries to bring together what he calls "philosophical discourse" and "realism" in a study of "the irrationality of the institution which most strikingly embodies the rationality of the West" (p. xv).

His book consists of three parts: Part I, "The New World" (pp. 3-68), presents a brief and schematic history of the relations of science and politics from the seventeenth century to the present, emphasizing the growing interpenetration of scientific knowledge and political power in the modern state. Part II, "Politics in Science" (pp. 71-144), consists of discussions of problems of science policy, such as planning and forecasting the development of science and the allocation of resources among different parts of science. Part III, "Science in Politics" (pp. 147-253), raises questions about the moral and political implications of scientists' roles in public affairs.

The general result is disappointing. Even though Salomon is a sophisticated observer with wide experience as well as an admirable mastery of a vast literature, his book lacks both the kind of documented evidence that could make it significant for the historian of science and politics, and the analytical rigor and theoretical depth that would make it useful for the social scientist. Instead, this volume takes on the characteristics of that special genre which has produced the business executive's "philosophy of the economy" or the practicing diplomat's "theory of international relations"—a cluster of worldly common-sense observations made by thinking participants who bring from their eventful odyssey into the "real world" some precious insights, some moral teaching, and some visions or warnings of what is in store for us in the future.

This kind of literature, however, is not entirely without its own value insofar as it furnishes insights into the symbolic constructs with which participants organize and systematize their experience. Of particular interest in Salomon's book is the underlying tension between the commitment to the ethos of science and to the cultural diffusion of scientific knowledge on the one hand, and the disenchantment and skepticism generated by the encounter with the "logic" of politics on the other. This book can be read at least in part as a description of the political education of scientists, a process through which they discover the limits of the power of knowledge and rationality in public affairs.

Salomon's main argument seems to be that since World War II a process of convergence of science and politics, whose signs were already manifest after World War I, became widely recognized and progressively institutionalized. He suggests that the fusion of the scientific and the political activities has altered the role of the scientist in society, that it has turned him from a "savant"—a definer of truths enjoying the status of a "cultural figure"—into a lower-grade technician, a sort of "production agent" in the service of political power (p. 251). In advancing this argument, Salomon adds to a discourse already overburdened by neologisms the term "techno-nature" (p. 174) to indicate this convergence between science and politics—where perhaps it may have been the better part of wisdom to heed Occam's great dictum that "entities ought not to be multiplied except out of necessity." Even though, as Salomon suggests, the interpenetration of science and politics is the dominant feature of the state of science in contemporary society since World War II, his discussion of this phenomenon is handicapped by a frame of reference within which it is defined as another phase in the Manichaean history of the struggle of science "against the spirit of authority" (p. 73). He views politics primarily as the cultural manifestation of the irrational and the growing centrality of scientists in public affairs as threatening the glory of science as the cultural expression and symbol of truth.

This perspective obviously is not congenial for a study of the interrelations of science and politics as distinctive cultural activities involving the interaction of different languages, modes of action and institutions.

An investigator uninhibited by a demonological "theory" of politics and unconfined by the narrow concerns of science policy could, perhaps, direct the inquiry on the interrelations of science and politics toward a host of strategic questions which remain largely untouched by Salomon and others in this field. It might be fruitful, for instance, to raise such questions as: what are the political significance and uses of the social authority of scientists in political contexts aside from their intellectual skills? How does their professional role as men of knowledge interact with their roles in the larger society as popularizers, advisers, critics or legitimators? How is the selective reception of scientific knowledge in the public domain affected by the prevailing ideologies, the distribution of political power, the nature of political authority, the procedures of public policy and other such characteristics of political systems? Does science influence public perceptions and evaluations of government performance? What are the differences in the ways the scientific enterprise is socially organized in relation to political authority among different political systems, and what is their significance for comparative studies in politics and culture?

From the perspective of political science, the interrelations between science and politics ultimately fall within the boundaries of such classical topics as "rationality and politics," "truth and justice," "knowledge and authority." The potential contribution of modern political

science to these traditional debates is not confined, however, to the novelties introduced by the historical specificity of modern forms of knowledge, politics or their interrelations. It may perhaps lie no less in the conceptual innovations which would open the way for studying knowledge and rationality in the dynamic context of political interaction and public policy and integrating the related scholarly tradition of political theory with modern theories of organizational and political behavior. Even though Salomon's book does not represent a significant step in this direction, it is a good representative of the present state of the art and may help clarify the limits which must be transcended if our understanding of relations of science and politics is to be enhanced.

YARON EZRAHI
The Hebrew University of Jerusalem

Psychoanalysis and the Law. By C. G. Schoenfeld. (Springfield, Ill.: Charles C Thomas, 1973. Pp. 285. $13.75.)

After a brief flurry of interest sparked by Harold Lasswell, few political scientists made any effort during the 1930s and 1940s to apply psychodynamic categories to the study of political behavior. Psychoanalytic insights were used by sociologists and anthropologists during the 1940s and 1950s, primarily for "national character" studies, and Talcott Parsons attempted to incorporate psychodynamic categories into the theory of action. By the late 1950s, however, interest had dropped off. The one enduring monument of the whole period was *The Authoritarian Personality* which, despite its flaws, has continued to influence and serve as a research guide for social psychologists, sociologists, and political scientists.

During the late 1950s and early 1960s, a few political scientists such as Lucian Pye continued the effort to interweave dynamic concepts of personality with the study of politics, but the bulk of the work in the area was left to psychologists and psychoanalysts with social concerns such as Kenneth Keniston, Robert Lifton, and Erich Fromm.

More recently interest has gradually revived. Following the lead of Erik Erikson, increasing numbers of historians are turning to "psychobiography," and a spate of books and articles indicates that political scientists dealing with problems of socialization are attempting, once again, to bring psychological (if not always psychoanalytic) insights to bear on their work. Thus far, however, the approach has barely gotten off the ground. There are many reasons for this, but at least two are immediately relevant with regard to psychoanalysis. First, psychoanalytic theory remains highly reductionist. Quite naturally, political scientists are not attracted to a discipline which treats the political world as epiphenomenal, i.e., as consisting of acts which are merely a projection and rationalization of primitive urges. Second, psychoanalytic theory is still based largely on clinical insights. Thus little effort has been made to develop propositions which can be tested at least in part, and instruments which can test them in some way or another.

By and large, then, books and articles which attempt to develop psychoanalytic perspectives still tend to be highly speculative and fail to offer the kind of approach or evidence which might commend them to working political scientists. Too many are still of a type which (a) review basic psychoanalytic hypotheses for a lay audience, (b) speculate about the inter-relationships between unconscious motives and social processes without offering any evidence for these speculations. Often such volumes promise much, if the research could be done, but after reading four or five which traverse the same ground with the same promise, one begins to become impatient.

The above comments apply to classics like Lasswell's *Psychopathology and Politics,* Kardiner et al., *The Psychological Frontiers of Society,* and Fromm's *Escape from Freedom* as well as to such lesser known works as Money-Kyrle's, *Psychoanalysis and Politics* and Ranyard West's, *Conscience and Society.* They also apply to the many psychoanalytically oriented "national character" studies which were supposedly to open the way to understanding the politics of particular nations.

Unfortunately Schoenfeld's book is of this type. The author is a lawyer trained in psychoanalysis, and it is clear from his writing that he is a serious scholar. But his attempted marriage of psychoanalysis and law fails for the reasons noted.

Essentially the volume consists of a very elementary discussion of psychoanalytic hypotheses followed by (1) propositions which are so ambiguous that they add nothing to our knowledge; (2) propositions which are so outrageous on the face of it that one is tempted to dismiss them out of hand; (3) propositions which are interesting, and which might conceivably be of some value but for which little or no evidence is offered. Let me offer some examples chosen at random:

In discussing the role of the Supreme Court in American society, Schoenfeld asks why so many Americans were shocked and dismayed by Roosevelt's "Court packing" plan. The answer is obvious to the author. The Court was a parent

surrogate to Americans, and Roosevelt's plan was perceived as an attack upon this surrogate. The author never asks why Roosevelt was not also a parent surrogate, nor (although he is aware of the fact) does he ever ask why most other nations do not have supreme courts which are regarded as parent surrogates. The Court's role, he suggests, stemmed primarily from the trauma of the Civil War which led to its elevation to the position it came to occupy, and other traumas confirmed this position. Yet many nations have faced comparable traumas without creating a "parent surrogate" court of this type. There may be something to the author's contention, but *only* if placed in a social and cultural context which explains the relevant differences between the United States and other nations, and supplies some evidence for the propositions offered.

Elsewhere Schoenfeld suggests that police brutality may be the result of the police acting upon unconscious sadistic impulses, but that those who "overemphasize" police brutality may unconsciously be trying to undermine the ability of the society to control aggression. Either or both propositions may be true, and reminding academic intellectuals that police chiefs and "hard hats" are not necessarily the only people behaving irrationally may serve some purpose, but the mere statement of the issue in the form in which Schoenfeld puts it leads us nowhere. The volume, incidentally, offers a rather lengthy discussion of unconscious aggression and the law, but aside from some references to Lorenz, the general discussion of the issue consists primarily of quotations from Freud and other psychoanalysts stressing the importance of the problem.

Just one final example. Schoenfeld reviews at length the problem of judicial "activism" versus judicial "restraint." His conclusion is that the arguments in favor of both are partly valid from a psychoanalytic perspective and therefore he can really come to no conclusion, unless it be that individuals should recognize that both judicial activism and judicial restraint are legitimate and necessary. The discussion hardly helps us with the problems we face in this area, and even the sympathetic reader is likely to conclude that reading it was something of a waste of time.

We do not need books which tell us how important it is to investigate unconscious mental processes as they apply to law or politics. We *do* need studies which demonstrate that we can reasonably do so in ways which enable us to have some confidence in our results. *The Authoritarian Personality,* with all its weaknesses, pointed in the right direction. One article which throws some light on our actual political experience by making use of psychodynamic hypotheses (and testing them) will convince more scholars to take such hypotheses into account than will dozens of volumes which, like this one, merely urge us to do so, and add little, if anything, to our understanding.

STANLEY ROTHMAN
Smith College

Voluntary Associations: Perspectives on the Literature. By Constance Smith and Ann Freedman. (Cambridge, Mass.: Harvard University Press, 1972. Pp. 250. $8.00, paper.)

The political scientist, having paid $8.00 for this paperback, is likely to feel further annoyance at finding the familiar subjects of interest groups, pluralism, and elitism dealt with from the perspective of scholars interested in voluntarism. As such it has a superficial quality which borders on the misleading, through some may find the very distinctiveness of its viewpoint suggestive in its implications.

This volume is indirectly related to David Horton Smith's Center for a Voluntary Society. The annual collections issued by this society (*Voluntary Action Research:* 1972, etc.), however, reflect a tone which the organization theorist will probably regard as more sophisticated than the present volume. Even the bibliographic function of these collections is in some ways superior, though neither they nor the present volume can match in usefulness Ralph Stogdill's related survey of the literature *Handbook of Leadership* (New York: The Free Press, 1974).

Smith and Freedman (Constance Smith was Dean of Radcliffe Institute prior to her death in 1970; Ann Freedman is Associate Professor of Political Science at Roosevelt University) begin their volume with "A Theoretical Overview" focusing on organizational typologies. Here the typologies of Clark and Wilson, Blau and Scott, and others are very briefly outlined. Organization theorists will be dumbfounded by the omission of famous constructs which belong in such a review, such as the typologies of Talcott Parsons, Amitai Etzioni, or James Thompson. On the other hand, several lesser-known contributions are outlined. No attempt at critical evaluation or synthesis is made here or in the following section on "Small Group Theory," which surveys the reviews of the subject, again without critical comment.

Chapter Two presents "The Pluralist Thesis." First "The American Tradition" is outlined, treating Tocqueville, Bryce, the social historical work of the Handlins, and a few minor contributions, and omitting discussion of the Federalists,

Calhoun, and the conservative theorists of the post-bellum period. Classical pluralism receives somewhat better coverage, though the discussion is so superficial one gets no feeling for the issues involved or the differences with those in the pluralist tradition who preceded or followed. Contemporary American pluralism is treated in a conventional section outlining ideas of Rose, Kornhauser, McConnell, Truman, Latham, Bentley, Key, Banfield, Lindblom, and a few others.

Chapter Three on "Pluralism: Attack and Defense" briefly treats Schattschneider, Lowi, Mills, Hunter, Schumpeter, Lipset, Polsby, Dahl, and Walker. A few discussions, such as that on Kornhauser, are extended enough to be of substantive interest. Some, like that on community power structure research, are so superficial they could better have been left out entirely. The radical elitist position is portrayed in stereotyped and dated terms, ignoring authors who followed Mills (e.g., Domhoff).

Chapter Four outlines writings on "Voluntary Associations and the Political System: Data." Here we find a survey of Milbrath, Lane, Almond and Verba; Berelson, Lazarsfeld, and McPhee; Prewitt, Stouffer, Rossi, Rosenau, Cutright, and others. Chapter Five surveys literature on participation in politics. Chapter Six surveys sociological literature on the relation to voluntary association memberships of class, race, ethnicity, sex, age, and attitudes. After this a much better treatment of community studies ensues. Two final chapters discuss "how-to" literature, studies of particular voluntary associations, and studies of VISTA and other government-related voluntary programs.

All these chapters, like the ones earlier, serve the useful purpose of providing the interested scholar with a concise overview of selected literature in the various related fields of interest. Throughout the discussion is bibliographic rather than critical, and hence the level is necessarily elementary. The surveys are neither comprehensive nor up-to-date, even for 1971. Omissions are striking, to the point of misleading the uninformed user.

In sum, Smith and Freedman have cast a wide net and have pulled in much that is of interest—some conventional, some important, some trivial. Their material is presented under headings no more arbitrary than the next, and while the presentation seems rambling because no critical argument is being made, researchers may find useful the orderly listing of more than six hundred sources pertaining to voluntarism. If the net result is less than compelling, this is less attributable to the authors than to the intellectual confusion which seems to surround the formation of new subdisciplines, whether urban studies or voluntary action.

The Baku Commune, 1917–1918: Class and Nationality in the Russian Revolution. By Ronald Grigor Suny. (Princeton, N.J.: Princeton University Press, 1972. Pp. xxviii, 412. $15.00.)

This study, characterized by good scholarship, proceeds to set the record straight before an official interpretation of the history of the Baku Commune in Soviet historiography which was maintained for reasons of political necessity. Professor Ronald Grigor Suny's work has the additional merit of focusing on a period and a place that have received only limited attention in Western scholarship. This is all the more welcome as the case of the Baku Commune condenses in time and space the major questions and problems the Bolsheviks were eventually called to deal with throughout the tsarist empire. And if Baku had not been threatened by and eventually fallen to the Turks in mid-September 1918, Stepan Shaumian, Prokofiia Dzhaparidze, and their Bolshevik colleagues might have given Lenin and the others in Petrograd an example of Bolshevik power based on worker class-consciousness and cohesion where terror was virtually nonexistent. Shaumian might have even shown how to avoid interethnic warfare in Transcaucasia. As Suny writes: "More moderate than their Petrograd comrades, they had deep roots in the city, long training in the economic struggle, and a sensitivity to the dangers of interethnic warfare" (p. 344). External factors were however not the only ones to plague Baku, for the city was a microcosm of the nationality problems the Bolsheviks had to face in Russia. The author deals with these problems with great sensitivity and care.

Suny has left few stones unturned in his research, and his study is as thorough as it is fascinating. He has not only brought to light a literature on Baku written in the U.S.S.R. in the 1920s, which, even if it is pro-Bolshevik, had not yet suffered the later Stalinist deformations, but through his own research, he has given Western scholarship an analysis of the problems created in Baku by class and especially by nationality during the Russian Revolution. In fact, the two variables were inextricably connected: "Most of the skilled workers, office employees, and administrators were Armenians and Russians, while the Azerbaijanis and Daghestanis formed the bulk of the drillers and field workers. Nationality tended to accentuate differences of status

within the working class" (pp. 13-14). Its oil fields made Baku a vital city in the power struggle waged throughout Russia in 1917 and 1918. Shaumian and his comrades were able to rise to power despite the seemingly unsurmountable nationality problems partly because of the inability of other parties, especially the Mensheviks and the Right Social Revolutionaries who held power in the Soviet after the February Revolution, to respond to the anticapitalist mood of the workers which the Bolsheviks knew how to exploit. They successfully led the September strike, and throughout October it looked as if they might carry themselves to total power, given the cohesion the working class manifested around them. This was not to be, however, for Shaumian was no Lenin, as Suny writes: "There was no Lenin in Baku who combined a resolute will to power with the necessary influence within the party, no one to argue that 'to wait is a crime against the revolution' " (p. 349). This class cohesion was short-lived and under external pressures gave way to national warfare which proved the undoing of Bolshevik power and resulted in the loss of Baku to the Turks.

On the question of political power, the Baku Commune and especially its chairman, Shaumian, stand out as examples of tolerance and democracy. Political parties were allowed to function and publish their newspapers; all Shaumian required was that they recognize Soviet power. Their participation in the Sovnarkom depended on this recognition. The rules of democracy were observed and when the Bolsheviks lost the confidence of the Soviet, they withdrew. This was indeed rather un-Bolshevik and un-Leninist behavior and within the context of the Revolution in Russia, where tolerance was the exception rather than the rule, it led to the undoing of the Baku Bolshevik leadership. When Baku fell to the Turks, twenty-six of the leading members of the Soviet who had fled the city, including Shaumian and Dzhaparidze, were captured by the Ashkhabad Committee, then in the hands of the Social Revolutionaries, and executed. Bolshevik power in Azerbaijan returned only in April 1920.

Although there is no theoretical model or lesson to be drawn from the Baku Commune, its history as presented by Suny is a valuable addition to the history of the Russian Revolution.

Flucht in den Mythos: Die Deutschnationale Volkspartei und die Niederlage von 1918. By Annelise Thimme. (Göttingen: Vandenhoeck und Rupprecht, 1969. Pp. 195. DM 7.80.)

In the complicated political spectrum of the Weimar Republic, the principal conservative role was assumed within days of the November, 1918 revolution by the newly created German National People's Party (*Deutschnationale Volkspartei*—DNVP). Intended to group various right-wing elements that otherwise despaired of survival in a democratic republic, the Party from the beginning was troubled with organizational and leadership difficulties, seriously hampering its political effectiveness. Having to satisfy East Elbian Junkers of the old German Conservative Party on the one hand, Christian Socialist workers in Westphalian industry, white-collar workers in Hamburg (members of the active *Deutschnationaler Handlungsgehilfenverband*), and remnants of the superpatriotic wartime German Fatherland Party among others, a satisfactory Nationalist platform was never easy to put together even at the best of times. There need be little surprise, then, if the Party demonstrated striking inconsistencies in its day-to-day activities and, in its basic programme, tended to those vague generalities identified by historian Annelise Thimme as a flight to myth.

Professor Thimme of the University of Alberta attempts to explain the essential character and motivation of the Nationalist Right in a relatively short study covering the whole period of the Republic. Although not intended to be a party history, the work is useful to those who want quick access to information on the platform, basic ideas, leadership, and tactics of the DNVP. But it remains an exercise in interpretation rather than research.

Essentially hostile to the new regime, the DNVP was never able to make the transition of Gustav Stresemann's German People's Party to reasoned support of the system. At best the Nationalists were ambivalent, as Professor Thimme ably demonstrates. They cooperated positively on aspects of the constitution in various committees of the National Constituent Assembly, and later twice joined government coalitions. The latter experience proved unfortunate for the coalitions as well as the Party itself. Its essential nature was not only to be negative under existing circumstances, but also to serve as an opposition: the disloyal opposition, for the most part, of *enragés* whose ire could be expected to rise at the prospect of even momentary successes of the hard-pressed Weimar Republic. If the Party could not command the votes needed to give it power, still it helped shape a public opinion that did much to nullify the liberating effect of Stresemann's imaginative foreign policy. The Dawes and Young plans, the Locarno Treaty, even Germany's entry in the League of Nations were denounced with constant vitriol. Stresemann had sought refuge in Bis-

marck's dictum of the primacy of foreign affairs. It was countered, with no little success, by a Nationalist line of vilification that endured through the Republic's fourteen years, with no genuine truce. The irresponsible, obstructionist tactic was to be adopted and pushed even further by the National Socialists whom the Nationalists attempted to use. In the end the Nazis were able to use and discard the Nationalists with ease.

Thimme follows others in showing the Nationalist juxtaposition of myth against myth: that is, the stab-in-the-back legend versus the November revolution. Nor is there much new in her description of the discomforts of the authoritarian, Nationalist personality in the environment of a democratic society. More difficult, and less successful is the author's attempt to characterize the Nationalists psychologically. Where hate prevails, she notes quite late in the book and almost parenthetically, there are also feelings of guilt and *Angst*. These in turn create the characteristic elements of frustration and aggression in the Nationalist style. The subjective chaos among these conservatives then would appear to be much greater than the objective chaos caused in Germany by the revolt against the Empire. That may well be—but Thimme's writing abounds in too many such unproved or only half-demonstrated surmises from different strands of social science. And there the suggestions remain, thought-provoking sometimes or merely irritating and misleading, for the most part unintegrated with the historical phenomenon under consideration. The result, then, is to create mystification about a group perhaps not really all that difficult to comprehend.

The Right has been amply studied in other countries, but overshadowed in Germany by the Fascist experience. Certainly the German version of the Right after 1918 is worthy of study on its own, if only to show how the conservative side undermined itself as a credible political alternative even as figuratively it dug the Republic's grave. While the subject has not attracted many writers, the outlines are now in place. We must now await further efforts to put it all together.

LEWIS HERTZMAN
York University, Toronto

Utopia and Reform in the Enlightenment. By Franco Venturi. (Cambridge: Cambridge University Press, 1971. Pp. v, 160. $8.50.)

The Shape of Utopia: Studies in a Literary Genre. By Robert C. Elliott. (Chicago and London: The University of Chicago Press, 1970. Pp. xii, 158. $6.50.)

In the publication of his 1969 G. M. Trevelyan Lectures Franco Venturi has made available to a wider audience a series of essays that are stimulating, richly suggestive, and as impressive in their thesis as in the range of their scholarly reference. They are also frustrating and unnecessarily difficult.

Venturi is initially concerned with the way that intellectual historians tend to see their task. He protests that they have been excessively preoccupied with finding the roots and sources of ideas at the cost of slighting the question of how various ideas function in their immediate social and political context. "Evidently we must not follow the ideas back to their origins, but examine their function in the history of the eighteenth century. Philosophers are tempted to push upstream until they arrive at the source. Historians must tell us how the river made its way, among what obstacles and difficulties" (pp. 2-3).

As a model of that approach Venturi seizes upon the circumstances that influenced the meaning of the republican ideal in eighteenth-century political discourse, showing how a republican model initially associated with reform eventually played a decisive role in utopian thinking. In his view, ideas of political reform were generally articulated as restatements of a republican theory of politics, a republican theory owing at least as much to the example of contemporary republican institutions as it did to the history of classical antiquity. The first group of enlightened intellectuals to come to grips with immediate political problems linked the problems of greater intellectual liberty with the question of an enlarged political liberty. Toland, Molesworth, Collins, Moyle, Trenchard, Shaftesbury and their colleagues held that the struggles for a genuinely rational religion (deism) and a truly rational politics (republicanism) were, in fact, simply different aspects of the same endeavor. They were important as transmitters of the idea of a moral republicanism to enlightened thinkers on the continent who, in the troubled times around the middle of the century, were in need of a rational reform ideology.

By the middle of the century the existing republics had declined to a point where they existed at the sufferance of the great powers. It was clear, Venturi tells us, that their problems of endemic political instability and financial crisis were practically insoluble. As the existing republics became manifestly inadequate as models for the reform of the institutions of the large nation state, republicanism became increasingly a matter of an ethical idea. Hence, as Venturi shows, a thinker like d'Argenson could speak of the ideal French king serving as the protector of his people, making France a sort of monarchical republic. The republican ideal in the minds of

thinkers as diverse as Montesquieu, Diderot, and Rousseau essentially meant moral government free of the caprices of absolutism. Furthermore, influenced by the change in moral thought, the republican ethical ideal lost its classical association with the virtue of frugality and assumed overtones which tied morality and prosperity together. Venturi suggests, correctly it seems, that it is more useful to think of political thought in the late eighteenth century in terms of modifications of the republican tradition than in terms of an unfolding democratic theory.

As a moral ideal, the prospect of a republican monarchy served to animate the reforming efforts of men such as Turgot and many lesser figures. But in the 1770s and 1780s the possibility of reform seemed increasingly remote and the philosophers wearied of talk of it. Venturi chooses to discuss this process and the radicalization of the reform impulse by considering the nature and fate of Becarria's ideas on the right to punish. Becarria came close to advancing a utopian critique of social and political institutions, but he would not go beyond the suggestion that property rights might perhaps be unnecessary. He offered a reforming, utilitarian program designed to abolish unnecessary barbarity in the system of justice. In his discussion of the French responses to Becarria's views, Venturi makes it clear that Voltaire had little interest in Becarria's theoretical principles, but much interest in his ideas as practical weapons to be used in the war against palpable injustice. Diderot, considering it impossible to preserve the social order while also saving the criminal element, could not even make pragmatic use of the Italian's book. Others, Mably and Linguet for example, argued that the necessity for punishment derived from the unequal distribution of property and that unjust laws were required by an unjust society. Thus, Venturi argues, reformers were led to the conclusion that the only path to genuine justice led beyond reform to the abolition of the immoral social, economic, and political order. Reform was merely cosmetic, a change in appearances which would only hide the fact of radical institutional injustice. Only a society without sharp social and economic divisions, ideally a society without property, would allow the republican moral ideal to become reality.

This brief summary scarcely does justice to the scope of Venturi's perspective which embraces a host of minor figures in western Europe and the development of political ideas in Poland, Italy, Spain and elsewhere. Valuable as these references are, however, it is regrettable that Venturi has occasionally sacrificed clarity for the sake of breadth. Lectures cannot be expected to be as exhaustive or definitive as a monograph. Nonetheless, even within the limits imposed by the lecture format, Venturi's ideas could have been put forward more clearly. The central theme of the work is obscure on a first reading, a defect that could be remedied easily with a paragraph sharply establishing the focus. Central terms are sometimes used in very special senses that are not adequately discriminated. The reader is too often left following Venturi into remote areas without a solid sense of purpose. Yet this splendid book sheds much light on a critically important topic, and it suggests a multitude of issues requiring further investigation. As a seminal work it ought to be read by anyone concerned with the political thought of the eighteenth century, but to be comprehended it will have to be read more than once.

Among the seven previously published articles brought together by Professor Elliott at least three ought to interest specialists in intellectual history and the history of political theory. In the first, "Saturnalia, Satire and Utopia," he focuses on the way in which both satirical and utopian literature create their effect, at least in part, by implicitly or explicitly establishing a standard in terms of which existing society is found defective. In utopian literature this criticism is the most positive argument in favor of the proposed utopian model. In early modern utopian literature utopia was offered as a nonrealizable standard in terms of which the faults of the present could be better seen and thus reformed.

In the essay on "The Fear of Utopia" Elliott shows that in modern times utopian theories have tended to function as descriptions of a "nowhere" which is to be brought into historical existence. As utopia has lost its association with reform and become the basis of radical political action and governmental policy, the term has come to suggest fanaticism and unrealistic expectations. Nonetheless, the terrors and frustrations of twentieth-century history would seem to provide adequate background for a flourishing utopian literature. Yet as the potential of behaviorist psychology, mind-altering drugs, and social engineering seem increasingly ominous, it has been difficult to create esthetically and morally attractive radical models of society. In his discussion of recent "Anti-Anti-Utopias" Elliott considers the ways in which B. F. Skinner in *Walden Two* and Aldous Huxley in *Island* have tried to elaborate postmodern utopias. In this insightful and stimulating brief book the author is sensitive to the continual interplay between writer, text, and society in a manner that makes his comments valuable to others besides students of literature.

RODNEY W. KILCUP

Foundations of Political Action: An Exchange Theory of Politics. By Sidney R. Waldman. (Boston: Little, Brown and Company. 1972. Pp. 256. $3.95.)

In *Foundations of Political Action*, Professor Waldman, building on the work of George Homans, constructs a model of political exchange, fortifies it with propositions from learning theory for realism, and demonstrates that many broad- and narrow-gauge social theories can be brought within its terms. He has written an interesting book.

Waldman is at once confident of the wide explanatory power of exchange analysis and critical of the psychological assumptions with which it has so far been infused by economists, sociologists, and political scientists. He sets out to refine the assumptions with data about the ways in which people seek rewards from one another and reinforce each other's behavior patterns. The result is a reduction of old and new lines of thought in the study of the individual and society to statements about the exchange of human activities.

Illustrative chapters on political culture, modernization, legitimacy, political parties and interest groups, and conflict resolution follow the general arguments. To regard political behavior as give and take is less commonplace in some of these areas than in others, and therefore the chapters are not equally provocative. But on the whole, they are a mine of ideas. The strength of the book is in these chapters. They can be consulted separately by those with matching interests.

At the end of the volume, Waldman goes on to suggest other applications:

> The theory could be applied to an examination and analysis of electoral politics (the exchanges between parties and voters, between competing parties, between would-be officeholders and their following, between party activists and voters, between candidates and the media, etc.). It could be used to analyze the rationales underlying party and voter activities and, for that matter, to analyze the exchanges between legislative parties. It could be used to examine the relations of the mass media to the public, the government, and the business community, to analyze the relations between various interest groups, and to explain the bases of power in various institutions. It could be used to analyze the dynamics of revolutionary and radical movements . . . (pp. 205-6).

And so on, at some length.

Waldman's forte is the manipulation of ideas. He is as often as not content to establish the equivalence of exchange and other theories, describing many things with a single model rather than concentrating his resources to describe a few things better. It is suggestive, for example, but not clearly advantageous to translate Peter Blau's idea of the growth of trust between those who exchange into the reward-and-reinforcement language of learning theory.

And Waldman is conspicuously more interested in putting theories together than in making sure they work, for all of his criticism of unchecked *a priori* reasoning in the social sciences. He sometimes falls into a categorical mode of expression—notably that X "explains" Y—that obscures an underlying commitment to empiricism. His statements should read as hypotheses to be tested, or further tested, whatever the nuances of his style.

Foundations of Political Action is not the best introduction to exchange theory for undergraduates. The writing is unnecessarily difficult. The general reader will still find Blau's *Exchange and Power in Social Life* more to the point. Waldman's book is to be recommended instead to those with a serious interest in the elaboration of exchange theory or in one or more of the topics he has selected for illustration.

The publisher includes this volume in its series on comparative politics only by stretching the term some.

ROBERT J. SICKELS
The University of New Mexico

Systems Theory in International Relations: A Study in Metaphoric Hypertrophy. By John J. Weltman. (Lexington, Mass.: D. C. Heath and Co., 1973. Pp. 99. $12.00.)

This book is a critique of the systems-theory approach to international relations. The author begins by suggesting that the roots of the approach are in general systems theory and sociological functionalism, both of which are characterized as "holistic" and overly abstract. He then focuses on the works of Morton Kaplan, Ernst Haas, and Richard Rosecrance.

Professor Weltman performs a valuable service in the second chapter by condensing the main features of *Systems and Process in International Politics*, and Kaplan's subsequent revisions of that work, into nineteen pages of quotations and commentary. Weltman discusses problems raised by Kaplan's notions of stability, equilibrium, regulation and disturbance. For example, he says, "In what sense a change involving change in the system itself can still be indicative of a form of *stability* is unfortunately not made clear" (p. 16). Weltman criticizes the "six essential rules" of the balance of power or multipolar system and the rules of the loose bipolar system as tautological or logically inconsistent or both.

In the third chapter, the author takes aim at *Beyond the Nation-State*. Weltman criticizes

Haas for using the systems approach to relabel old concepts without adding to their usefulness, for classifying states into ideological types, for talking about the motives or objectives of states and international organizations as if they were not "complex, ambiguous, and resistant to description" (p. 41), and for "the ease with which the approach is employed to give a pejorative characterization to one group of states" (p. 46). His main concern, however, is that "Haas is unable to demonstrate the necessity of the systems approach in arriving at his substantive conclusions" (p. 48). This is the weakest chapter in the book.

In the fourth chapter, Weltman criticizes Richard Rosecrance's *Action and Reaction in World Politics*. This chapter is much more on the mark than the previous one, emphasizing as it does that the main explanatory variables, the "disruptive" and "regulative" factors in Rosecrance's nine historical systems, are not defined precisely and are not measured independently of the dependent variable, international "stability." He also criticizes Rosecrance for overemphasizing the effect of ideology on cooperation and conflict in international systems.

The fifth and sixth chapters are devoted to a review and critique of works on "regions" or "subsystems" and on bipolarity and multipolarity. Although it is a fair review, the criticicisms are neither original nor convincing. Weltman fails to discuss any of the empirical findings of scholars like Bruce Russett, Steven Brams, and Michael Haas.

Weltman reserves the final chapter for a summary and his ideas for an alternative approach. He criticizes systems theorists, especially Kaplan and Rosecrance, for "reifying" the concept of a system (p. 78). He criticizes them for not providing testable hypotheses or quantifiable variables. He suggests that even if quantification were possible, the systems approach would still be unable to provide novel hypotheses. I disagree. It seems clear to me that this approach already provided novel hypotheses. Hypotheses linking the "stability" (peacefulness) of international systems to bipolarity and multipolarity are novel. They are much more precise and testable than traditional "balance of power" formulations. Using international systems as units of analysis is novel. Indeed, it is one of the perhaps unanticipated effects of systems theory that we are now talking about hypotheses at all.

The alternative which the author proposes begins with Weber's fourfold typology of conduct: 1) goal-oriented conduct, 2) value-related conduct, 3) private, emotional conduct, and 4) traditional conduct. Weltman suggests that political action is primarily goal-oriented and tradition-oriented activity. Social relationships are the results of interactions between individuals are therefore highly complex. "A state is not an organism, but a bundle of individual action" (p. 87). Nevertheless, the state may die if essential "behavioral orientations" are changed. These essential behavioral orientations are the product of tradition-oriented behavior, sometimes originating from goal-oriented activity.

Given this epistemology, Weltman suggests four "levels of analysis" for the study of cooperation-conflict in international politics: 1) the state, 2) "discrete interstate social relations," 3) a map of these relations in a given period of time, and 4) the "typological evolution of this map" (p. 90). What these levels mean is not entirely clear from the two pages which are devoted to them. Nor is it clear what the author means by saying that "in the abstract" his approach "would appear promising" (p. 91).

I found this book to be difficult to read, primarily because it condenses into such a small space the arguments which originally occupied several thousand pages. But that is also one of its primary attractions. It would be useful for graduate assignments, in conjunction with the original works. Nevertheless, Weltman is not consistently careful in his criticisms, and he shows very little awareness of the field outside the works cited in the book. This is particularly unfortunate since several writers have attempted to extend or modify the systems approach in ways which answer some of Weltman's criticisms. For example, Steven Brams attempted to replace the systems approach with a "structural" approach, based on mathematical theories which allow quantification of variables and hypothesis testing. The fact that these theories are "holistic" requires some rethinking on the part of critics of systems theory. Herbert Simon, in his *Sciences of the Artificial* and articles on decomposable systems, extended the range and applicability of systems theory far beyond the limits imposed by Bertalanffy or Talcott Parsons. A more satisfactory critique of systems theory would have to take into account a wider range of works than are discussed in this book. An exploration of the theoretical similarities between systems theory and "structuralism," although a very difficult undertaking, would be extremely valuable.

JEFFREY A. HART
Princeton University

System and Structure: Essays in Communication and Exchange. By Anthony Wilden. (New York: Barnes and Noble, 1972. Pp. 540. $23.75.)

This volume collects the numerous essays in which Anthony Wilden has developed some

aspects of communication theory and applied these insights to a selected group of thinkers and topics in the social and psychological sciences. Principal attention is directed to "structural" anthropology and psychoanalysis. The reader will encounter an extended critique of Levi-Strauss, the anthropologist, and Lacan, the psychoanalyst, who is credited with driving his French audience to reread (or, more likely, to read) the collected writings of Freud. Creative use is made of Gregory Bateson's "double-bind" principle and also of Bateson's theory of mind.

Wilden is at home with "the complex epistemological reorganization" now taking place, which he succinctly, if technically, characterizes

> in a number of different but related ways: from stasis to process, from entity to relationship, from atom to gestalt, from aggregate to whole, from heap to structure, from part to system, from analytics to dialects, from closed systems to open systems, from causality to constraint, from energy to information, from bioenergetics to communication, from equilibrium theory to negative entropy—in a word, from atom to system and thence to ecosystem (p. 241).

Political scientists will be disappointed to find that power outcomes are not given explicit systematic treatment, although many of the intellectual tools required for such an undertaking are packed in the bag. However, one of the principal theses put forward by Wilden is expressly "political." The author endeavors to connect some features of the prestructuralist epoch with the class system. An example of this mode of approach is the discussion of Piaget in Chapter 11. The argument is that Piaget's conception of development is not truly contextual. Rather, it remains rigidly, not flexibly, systematic. This is attributed to the influence of a middle-class environment on Piaget's outlook. Such an environment is asserted to be incompatible with the acceptance of drastic change pursued by drastic methods.

Among the most rewarding chapters is Chapter 7 which examines analog and digital communication. Analog conceptions are continuous, Professor Wilden reminds us. Therefore, in a world of continual interaction (or process), these conceptions are more fundamentally oriented than digital frameworks can be. Chapter 12 discusses "Ecosystem and Metasystem," setting forth "a morphogenic model of emergence in open systems." Closed systems reiterate past patterns of relationship. Open systems, by contrast, are able to establish new ways of relating themselves to energy sources. The problem is to account for, and to provide programs for directing the crystalizing of new, if inveterately provisional, structures in open systems.

In future work it is to be hoped that Wilden will demonstrate how his approach can be used to obtain more innovative results than the revival of hypotheses about the rigid perspectives of the middle classes. The analysis of exchanges among valued outcomes can be fruitfully carried much further. As employed in the present essays the distinction between "symbolic" and "imaginary" exchange is one of the many promising leads.

Policy Sciences Center, New York

Congressmen's Voting Decisions. By John W. Kingdon. (New York: Harper & Row, Publishers, 1973. Pp. 313. $8.95, cloth; $4.50, paper.)

John Kingdon is a reasonable man. His earlier study of the beliefs and strategies of political candidates investigated a reasonable subject by reasonable means and with reasonable conclusions. His new book on the House of Representatives more or less follows suit. Little here contradicts or departs radically from the recent tradition of legislative research, nor are many of the ideas or conclusions particularly startling. But neither are there glaring problems with what he has done. To be reasonable, however, is to risk being forgettable. I suspect that legislative scholars will read this book without any perceptible effect on their blood pressure, and come away without much more than the satisfaction of having made another attempt, however futile, to keep up with the work in their field.

Professor Kingdon focuses on congressmen's voting decisions on the floor of the House. While paying properly footnoted obeisance to the many studies which correlate (at a minimum) roll-call votes with everything imaginable, he recognizes that such analyses do not confront the human problem of an individual representative making a specific voting decision. His emphasis, therefore, is on how individual congressmen decide to vote under pressures of time and information. To find an answer, he turns to the members of the House themselves, asking them not about their approach to legislative decision making generally, but about why they voted as they did the week before. In multiple interviews with a stratified sample of congressmen, he asked them how they had made up their minds on recent votes which were somehow prominent, if not highly divisive. If his sampling and interviewing techniques do not permit exact replication, Kingdon's approach meets a more demanding standard—gathering useful information without confirming politicians' worst prejudices about political scientists.

The first half of Kingdon's analysis is devoted,

chapter by chapter, to a discussion of who and what might influence how a congressman votes. In order, he considers the impact of constituency, fellow congressmen, party and committee leadership, interest groups, the administration and executive branch, staff, and the media. In brief, he concludes that the first two are by far the most important, that the other possible sources of influence range in independent impact from marginal to negligible, and that, to the extent the others are important, they operate indirectly by influencing the attitudes of constituents and colleagues. Kingdon's enthusiasm for his subject seems to diminish somewhat in rough proportion to the importance of the influence he discusses in each chapter. His opening chapters are especially appealing, combining a relatively graceful style with a cogent synthesis of his own data and the literature from which he draws his inspiration. Unfortunately, his discussions of interest groups, congressional leaders, and the executive branch are somewhat more perfunctory, presumably because his data generally minimize their direct impact on individual decision making.

In his second set of chapters, Kingdon attempts to draw his disparate threads together into a model of congressional voting which he describes as "the consensus mode of decision." Without doing too much damage to the complexity of the argument, it may be summarized as follows: (1) when all or almost all of the potential sources of influence point in the same direction, that is the direction the congressman will take; and (2) this is what usually happens. Whether this argument appears reasonable or merely trivial depends ultimately, I suppose, on the knowledge that each reader brings to it. It certainly conforms with David Mayhew's recent emphasis on political self-preservation as a guiding principle of congressional behavior.

Kingdon avoids the danger of portraying the congressman-as-billiard-ball by emphasizing the extent to which the Congress and each of its members can create at least the appearance of a consensual decision-making environment. For example, the tendency for many committees to avoid conflict on the floor also eases the decision-making burden for the non-committee member by resolving or submerging the conflict he might otherwise confront. Even when conflict exists, however, it is mitigated (or avoided altogether) by a natural propensity to perceive and associate selectively, thereby constructing a decision-making environment which is apparently consensual and in harmony with the congressman's own predispositions. In Kingdon's terms, such "preconsensus processes" enable congressmen to remain within the comfortable confines of the consensus mode even on matters of high controversy.

In this book, Kingdon combines elements of a monograph and a text, imbedding the results of his own research in a synthesis which draws effectively on earlier work. It will be of some interest to specialists, but of greater value to teachers who descend from the heights of systems analysis to confront the question of how a congressman can vote for billion dollar bills without knowing the first thing about them.

STANLEY BACH
University of Massachusetts

A History of Regulatory Taxation. By R. Alton Lee. (Lexington: The University Press of Kentucky, 1973. Pp. 228. $15.25.)

This book is not primarily for the public-law scholar nor for the student of Congress. The author is a historian, and his book is likely to be of greatest interest to economic historians and to those interested in the extension of the national police power through efforts of Congress to regulate or outlaw products or activities through the taxing power. For more than a century Congress has occasionally chosen to use its taxing power to eliminate such diverse products and activities as state bank notes, oleomargarine, adulterated flour and dairy products, phosphorus matches, drugs and narcotics, child labor, gambling, guns, and grain and cotton futures. In the case of agriculture and mining, Congress tried in the New Deal period to assist these occupations through the use of taxes that would help to regularize wages and prices through reducing supplies.

Regulatory taxes, Professor Lee tells us, were frequently chosen when Congress questioned the constitutionality of its police powers in regulating interstate commerce. And, of course, industries regulated through taxes sought to overturn such legislation through the courts. Since the Supreme Court tended to find acts to tax to be purely revenue measures and within the power of Congress until 1914, Congress continued to use the taxing power for regulating interstate commerce. From 1914 until well within the New Deal period, the Supreme Court justices found tax measures that raised little or no revenue unconstitutional because (1) they interfered with the rights of the states in their exercise of the police power, or (2) taxed some sectors of the public for the special benefit of others (agriculture and mining). The court thus restricted congressional regulation of interstate commerce whether directly or through the taxing power for a period of almost 25 years. Subsequently Congress usually has regulated business directly under the

interstate commerce clause. When Congress has used the taxing power in more recent years for regulation as in the case of narcotics and gun control, Professor Lee believes the results have been unsatisfactory.

Occasionally statements or assumptions of fact in the book are intriguing and suggest interesting further studies. For example, in chapter seven, the summary of the abolition of phosphorus matches through the taxing power includes the information that the Diamond Match Company, on request of President Taft in 1911, made its patents on the safety match available to its competitors and even sent men from its factory to other factories in the nation to assist in initial manufacture of this new match. I wonder whether this action was motivated purely by the altruism of the firm's president or board, or by concern to avoid further public outcry against the unsocial behavior by trusts, or what? How is such behavior stimulated? What about the recent addition of women and minorities on boards of directors of some of our major companies? Do such acts provide a more positive public image of the companies, of women and minorities? Are there policy consequences for the companies in employment? In other ways?

This is a short, useful, but not distinguished book, with a price tag that will limit its sales almost entirely to libraries. I wonder whether this and many other such books might not come out exclusively in quality paperback at a substantially lower price than $15.25 announced for this one.

CLARA PENNIMAN
The University of Wisconsin, Madison

Programs in Aid of the Poor for the 1970s. By Sar H. Levitan. (Baltimore: The Johns Hopkins University Press, 1973. Pp. 146, index. $6.00, cloth; $1.95, paper.)

This book, which updates an earlier volume, contains a compact though detailed appraisal of U. S. government programs undertaken on behalf of the poor. Its author, Professor Sar Levitan, divides such programs among four categories and for each presents a concise description and evaluation of its ability to alleviate poverty at its present level of funding. (See pp. xi-xii.)

(1) "Income maintenance programs aimed at aiding the poor who are outside the work force" (largely the aged and female-headed families with dependent children).

(2) "Programs supplying goods and services" (medical services, food stamps, housing, etc.).

(3) Programs whose immediate goal is to avert the spread of poverty to new generations (birth control, child care, education).

(4) Programs to aid the working poor (manpower programs, the author's immediate area of specialization; equal employment opportunity; minimum wage legislation, etc.).

In the final chapter Levitan turns to goals and priorities. He recommends the adoption of comprehensive income maintenance, "more orderly . . . than the present haphazard, hit-or-miss public assistance programs," in which the income guarantee would, say, be set at "75 per cent of the level of income that would raise the recipient to the poverty threshold" (p. 134). Once this goal is reached, Levitan, in designing antipoverty policy, would emphasize programs in education, job training and job creation, and housing, and strengthen protective legislation to assure a proper institutional environment. The price tag of these "proposed modest priorities," he claims, "would be on the order of $20 to $25 million, and involve an increase of some 50 per cent of all public and private outlays in aid of the poor" (pp. 139-40).

As a primer, well-written and descriptive, this book, unlike most, will prove quite useful. No sophistication in economics is required of its audience. Thus, for the interested citizen or public official with limited time but an interest in familiarizing himself with the subject, it is a good starting point, and then some. For those with an analytic bent, however, it is a comfortable and fact-filled reference, generous in opinion and descriptive detail, but little more.

Levitan's openly displayed sympathy for antipoverty measures is both a strength and a weakness. His value bias is so explicit that the reader can easily allow for it and refocus the issues in terms of his or her own values. The chapter headings, quotations from the Bible and Talmud, indicate that Levitan, motivated by empathy, sees aid to the poor as something that is "right," a matter of "doing good," mandated by a sense of social justice. Indeed, these selections, from sources as diverse as Maimonides and Matthew, may themselves justify the price of the book. But the singlemindedness with which Levitan discusses redistributive programs, focusing almost entirely on their ability to reduce measured poverty at the expense of political justification and cost-effectiveness, leaves me more than a bit uncomfortable.

There is, I think, a far more analytic, and thus more substantive, basis for our social concern with poverty, producing programs to alleviate it, than the treatment in this book captures. The discussion of income redistribution to the poor, for a setting of representative democracy, raises far more complex issues of optimal amount and form than Levitan seems to recognize. To be sure one must consider what the poor themselves

think redistribution can do for them, and how quickly it can do it. But, if the aim is to *do* something for the poor, not just to wish it, the preferences of the taxpayer-donors who must finance such programs must also be considered. This is illustrated, regrettably, by the importance taken on by the work incentive issue in the political failure of a series of income guarantee proposals. Whether the disincentives which preoccupied the opponents of such legislation are real is less important than whether voters, whose vocal support its enactment required, thought and cared about them. Levitan's presentation would be more penetrating, albeit more difficult for those not schooled in the micro-foundations of public choice, if it examined why and how redistributive programs, which nominally benefit only a minority of the electorate, emerge from representative political process. It would be more useful, in setting forth a feasible basis for policy, if Levitan took into account that redistributive programs represent mutual self-interest, benefiting both donors and recipients, rather than obligations that the well-to-do must suffer for moral reasons, even if these are opposed to their self-interest.

To be even more pragmatic, it might be well argued that Levitan should give more emphasis than he does to the nature of the process, bureaucratic or market, through which anti-poverty programs operate. Indeed, his implicit distrust of the market, manifested, for example, in comments on the effectiveness of trickle-down on the supply of housing, is in my view a weakness of his discussion.

Fairness to Levitan requires me to make clear that these criticisms apply not only to his book but to the bulk of the output of the "income maintenance research industry." I make no pretense that the opinion they reflect, which is my own, is shared by a majority of those knowledgeable in the field. Dominance of heart over mind may reflect an admirable perspective in some humanistic inquiry. As a characteristic of policy analysis, however, it is fatal. When it comes to matters of distribution, too many legislators and the voters they represent are from Missouri; and too many of my fellow economists, including many who fancy themselves among the most pragmatic, are from Utopia.

The Politics of Depression: Political Behavior in the Northeast, 1893–1896. By Samuel T. McSeveney. (New York: Oxford University Press, 1972. Pp. xvi, 333. $9.75.)

In recent years historians have approached the historical roots of popular voting behavior with the same resolve—and a few of the same statistical tools—that political scientists like V. O. Key have used to analyze contemporary patterns. In this book, the fruit of many years of meticulous fact-gathering by a student of Samuel P. Hays, a significant portion of the story has been told. New York, New Jersey, and Connecticut were close battlegrounds in the 1880s and 1890s, especially the Empire State with its big electoral bonus for anyone who could chart his way through a bewildering variety of voter groups and a labyrinth of political factionalism. Professor McSeveney attends closely to the wealth of minor civil division, census, and electoral data to show how the nuances of rhetoric and event interacted to produce subtle decisive shifts in voting behavior.

Ethno-religious groupings, the author is convinced, were the primary units of party identification. While most historians would perforce agree, a more synthetic conceptual approach and a more sophisticated analytic technique would have greatly strengthened McSeveney's argument. In any case there is little doubt that in the Northeast, as in the Midwest, disputes among pietistic (e.g., Methodist, Congregational) and liturgical (especially Catholic) voters triggered the deepest emotional responses. The pietists, seeking to modernize society overnight by suppressing intemperance, gambling, and political corruption, made the G.O.P. their vehicle for reform. The Democrats regrouped the liturgicals by making laissez-faire into an anti-modernizing weapon. This succeeded until the cruel impact of the Depression of 1893 forced the urbanized electorate to appreciate the benefits of a full employment high-tariff policy and (in 1896) a probusiness financial policy. Bryan's moralism, like Cleveland's, left the unemployed and underemployed cold and hungry for McKinley's full dinner pail.

Most of McSeveney's nonstatistical information comes from a close reading of a dozen major metropolitan newspapers. He also combed the private correspondence of the leading politicians, thereby adding authority to his analysis of leadership perceptions and maneuvers. Had the author a keener ear for the lively quote or the apt phrase, his monograph would be pleasant to read. As it is, only dedicated specialists are likely to work their way through this dissertation. Further research will be needed before the full picture of northeastern politics can be seen. Nonetheless, a vital piece of jigsaw is now available to anyone who puzzles over the historical mysteries of American voting behavior.

RICHARD JENSEN
University of Illinois, Chicago and Newberry Library, Chicago

"Lessons" of the Past: The Use and Misuse of History in American Foreign Policy. By Ernest R. May. (New York: Oxford University Press, 1973. Pp. 220. $6.95.)

This is a well-written and thought-provoking little book by a distinguished American historian. In the preface, Professor May cites three theses which he hopes to prove: one, "that framers of foreign policy are often influenced by beliefs about what history teaches or portends"; two, "that policy-makers ordinarily use history badly"; three, "that policy-makers can, if they will, use history more discriminatingly."

The book is divided into two parts, the first consisting of four case studies around Roosevelt's prosecution of the Second World War and his efforts to build a new world order, Truman's decision in 1947 to aid Greece and Turkey, Truman's reactions to the outbreak of war in Korea in 1950, and Kennedy's and Johnson's decisions to defend South Vietnam with American arms. Part two of the book includes an analysis of the Johnson Administration's decision to bomb North Vietnam, a chapter entitled "Prediction: U. S. Foreign Policy in the Next Decade," and a final chapter in which the author pleads the case for professional historians being better used by foreign policy makers in the future.

The most interesting part of the book, in my view, is the analysis of the four episodes in American diplomacy cited above. Professor May makes a persuasive case for the view that Roosevelt's preparation for the postwar world was heavily influenced by his fear of a return to isolationist sentiment similar to what occurred in the 1920s. Roosevelt faulted Wilson for failing in 1918–19 to bring the Senate fully into the policy formulation regarding the League of Nations and other postwar planning, and he made great efforts to avoid that "lesson" of history in planning for the United Nations and other such proposals. The author also presents a convincing case that Truman was heavily influenced in his decisions in 1947 and in 1950 by his perception of what happened in the 1930's, when the Western powers did not challenge Germany, Italy or Japan in their aggressions until almost too late. He argues that Truman, like Roosevelt, may have overreacted because of a faulty reading of history. Finally, he takes Kennedy and Johnson to task for badly interpreting history in the decisions to intervene in Vietnam and the way in which the war was fought.

These four chapters are especially interesting and well documented, and therefore the reader is left somewhat puzzled by this statement which follows the case histories and tends to contradict them: "As with decisions by Roosevelt and Truman, so with those of Kennedy and Johnson one can plausibly argue that the outcome would have been the same even if inferences from history had played no part in the reasoning" (p. 115). Earlier Professor May states that he does not quarrel with the decisions made by Roosevelt in 1944-45, or with those of Truman in 1947 and 1950; he contends their decisions were sound but the reasoning by which they arrived at them leaves something to be desired from the viewpoint of a professional historian. He is tougher on Kennedy and Johnson, however, arguing that even though the decisions to go into Vietnam were made after the most careful staffing within the Executive Branch and agreed to by nearly all the highest echelons, the decisions were based on faulty premises and probably will be judged by history to have been "misbegotten blunders" (p. 121).

The chapter on predictions about U. S. foreign policy in the next decade does not measure up in scholarship to the earlier part of the book. To be scholarly about predicting the future, the historian would need to employ some of the analytical tools of the political scientist in order to assess what the international environment might look like in the 1980s and what changes might take place in American society by then. Here the author speculates about what the future might hold simply on the basis of his reading of the United States' behavior in the world since World War II. The historian's predictive powers are probably no better than those of political scientists or of competent journalists even though he has a clearer understanding of the past. What Professor May's study shows is that even history may not serve as a very good guide to understanding the future during periods of revolutionary change. In any case, this chapter lacks both documentation and convincing analysis.

Despite these few drawbacks, the book is worth reading. Thoughtful Americans will ponder, and debate, for years why "the best and the brightest" could have been so misguided about the degree of national interest the United States had in Vietnam in the 1960s. This book provides a fair and well-documented appraisal of what went wrong.

DONALD E. NUECHTERLEIN
Federal Executive Institute
Charlottesville, Virginia

Political Parties in Revolutionary Massachusetts. By Stephen E. Patterson. (Madison: University of Wisconsin Press, 1973. Pp. ix, 299. $12.50.)

Historians debate vigorously the question of when political parties appeared in the United States. Many agree that modern parties took

their basic form by the 1840s, but claims for the appearance of party earlier have a long tradition. Of course these claims are tied usually to different, modest definitions of party. Now Stephen Patterson has asserted that parties existed in Massachusetts from the 1750s to 1780. This not only clashes with other recent works, but also finds little support from Patterson's own evidence. Further, Patterson organizes his narrative with concepts that are anachronistic and chaotic. This is particularly unfortunate because he writes with skill and has worked hard. Though the book helps us to understand the complex divisions which accompanied Americans' passage to rebellion in one state, it is counter-productive with regard to party development.

Patterson insists that his parties were not "short-lived, issue-oriented coalitions but rather established parties that produced highly consistent voting patterns . . . over a number of years" (p. vii). They were not highly organized nor conscious creations of politicians but still a "structure of [two] party politics imposed itself on the controversy with Great Britain, defining the tactics of the Revolution" (p. 4).

Patterson recognizes that political elites still condemned "party" and "faction" because of their incompatibility with republican assumptions about government and society. He contends, however, that rhetoric lagged behind behavior, and discovers a gap between "antipartisan theory and partisan reality." Patterson tries initially to establish the reality of his parties by indiscriminately assembling usages of the term "party" or equivalents in Massachusetts from Jonathan Edwards in the 1720s to John Adams in 1817. These examples often have nothing to do with the "developing parties" which Patterson repeatedly asserts existed from 1757 to 1780. Sometimes "party" references are to temporary divisions within towns, but Patterson otherwise argues that mostly "the provincial parties represented intertown rather than intratown rivalries" (p. 4).

Indeed, from the late 1750s to the mid 1770s Patterson's claim rests primarily on his analysis of six available roll-call votes in the legislature in 1757, 1758, 1759, 1762 (when there were two), and 1764. These data, he warns, cannot be the basis for generalizations about the entire state. Of 204 towns in a 1761 tax list, only about 120 sent representatives to the legislature in any year, while absenteeism cut the average number responding in the six roll calls to 84. Patterson still finds some 122 "politically active" towns, of which 50 voted "with great regularity" with "the Court party," 52 voted with "the Country party," and 20 were "evenly divided." Partisanship appeared "in the remarkably consistent voting behavior of 102 of 122 politically active towns" (p. 33). But close examination of Patterson's active towns indicates that the data from which he generalizes should be reduced still more. Many towns classified as active frequently did not vote on all six roll calls. Thus, Hopkinton did not vote on the first five, but its single 1764 vote on whether Thomas Hutchinson would serve as the agent of Massachusetts in London earned it a place in the Court party. Similarly, 16 Court, 9 Country, and 8 evenly divided towns actually did not vote on half or more of the six roll calls. When votes with the opposition are added, 19 Court and 18 Country towns either did not vote or went with the opposition on half or more of the six roll calls. Other dubious classification criteria might be mentioned, but for more than a third of alleged "active" towns, I find voting neither very regular nor remarkably consistent.

Most of Patterson's efforts go toward showing that economic and geographic conflicts in Massachusetts influenced the course of Revolutionary politics. The difficulty comes in his insistence on describing any political conflict with any kind of social basis as partisan. About halfway through the book he sensibly remarks that "to men at the time, partisanship was a refusal to view public issues in a disinterested way. . . . In republican terms, partisanship was . . . selfishness . . . it was a political expression of economic differences" (p. 149). This may shed light on what eighteenth-century men meant when they accused rivals of being partisans. It does not at all mean that "established" parties imposed their "structure" on the Revolutionary period.

Patterson's Court-Country dichotomy relies heavily on a system of classifying towns on a commercial-cosmopolitan scale which Van Beck Hall developed for the 1780s in *Politics Without Parties: Massachusetts, 1780-1791* (Pittsburgh; University of Pittsburgh Press, 1972). Patterson applies Hall's index without modification to the 1760s (see p. 42), while rejecting the central contribution of Hall's study. Hall, finding sociopolitical cleavages similar to those Patterson uncovers, recognized that the 18th-century historian must do without the "ready-made" analytic structure which the party concept provides and must organize political data differently. Similarly, Jackson T. Main, in *Political Parties Before the Constitution* (Chapel Hill: University of North Carolina, 1973), finds parties in state legislatures in the 1780s and describes their social, economic, and cultural roots. But Main's legislative blocs are more convincingly established and he accurately calls them "preparty 'parties' " (p. xviii).

Patterson's approach also clashes with that found in Robert Zemsky's excellent study of the

Massachusetts legislature before 1757: *Merchants, Farmers and River Gods: An Essay on Eighteenth-Century American Politics* (Boston: Gambit, 1971). Between 1739 and 1756 Zemsky found 17 roll calls in contrast to Patterson's 6 between 1757 and 1764. Yet Zemsky observed that the House was suspicious of roll calls, did not ordinarily decide questions that way, and kept its debates secret. The scarcity of public roll calls "is an implicit warning about the relevance of such data." More important, Zemsky found no evidence of party behavior and emphasized the weakness of institutions and the strength of an antiparty ethos.

Patterson's narrative mostly has nothing to do with parties, but with movement to Revolution by shifting coalitions in the 1770s. He frequently calls the Country party the "revolutionary" party, yet takes some pains to show that Countrymen divided over the Revolution and that factions in the late 1770s were far more sectional than earlier. Patterson asserts that the east-west division generally coincided with merchant-farmer and maritime-country cleavages, though parts of his narrative show considerable fluidity among these cliché dichotomies. The latter is the strength of this book, but to appreciate it one must ignore the author's conceptual confusions. This book needed tough criticism before going to press. The political scientist seeking insight into eighteenth-century political culture will profit more by turning to Zemsky, Hall, or Main.

RONALD P. FORMISANO
Clark University

Dams, Parks and Politics: Resource Development and Preservation in The Truman-Eisenhower Era. By Elmo Richardson. (Lexington: University of Kentucky Press, 1973. Pp. 247. $11.25.)

The Truman-Eisenhower era seems far removed from contemporary national concern with environmental issues. Professor Richardson demonstrates, however, that essentially the same issues generated political controversy of comparable intensity, though on a less visible level, during this presumably quiescent period. Students of natural resource policy will find the major conflicts familiar. They involve, first, the conflict between resource development and resource preservation, and, second, the debate over federal versus local control of resource development. Richardson's history discusses these recurring controversies as they were played out during the Truman and Eisenhower administrations. For the most part, the drama takes place within the Department of the Interior, with the conflict between the mutually exclusive objectives of development and preservation finding embodiment in the Bureau of Reclamation and the National Park Service, respectively.

Conservation organizations such as The Sierra Club (renamed "The Sahara Club" by dam proponents during one such conflict) will find vindication in this book for their view that eternal vigilance is the price of a national park system. At every turn, it appears, there are interests eager to put the national parks to better use by the building of dams within park boundaries: Be it for the generation of hydroelectric power, for irrigation, or even for increased recreational opportunities, the Park Service and its supporters find the principle of "park inviolability" continually under attack. And, the attacks come not only from private economic interests but frequently from a collaboration of those interests with their own "colleagues" in Interior. Park proponents may well ask, with friends like this, who needs enemies?

Understandably, the Park Service's preservationist stance is frequently compromised by pressing economic needs, and Richardson's book is an interesting, and well-documented, account of the nature of conflict resolution within a politically fragmented department. As such, it is a useful companion volume to Harold Ickes' diary which discusses his tenure as Secretary of the Interior under FDR.

The second dispute which colors resource issues is the fundamental question as to who should have control of and ultimate responsibility for resource development, the private or the public sector? Naturally the issue is hardly ever stated so clearly; nevertheless that is what numerous policy questions in this area amount to. As Richardson says in the first pages, "By the time Roosevelt's presidency came to an end, Americans were committed to resource development, but still divided on the means to achieve it" (p. 18). He then shows that the difference between the Democratic administration under Truman and the Republican administration under Eisenhower on this important policy issue were slight. The Democrats leaned towards federal control of resource development while Republicans, such as Interior Secretary McKay ("Giveaway McKay"), leaned away. The difference was one of emphasis and not of substantial change. Thus in his concluding chapter Richardson asks perhaps the most pertinent question for political scientists, ". . . did it make any difference 'who was sitting on the lid' as policy maker" (p. 198)? A few pages later he answers by concluding:

> . . . the intersection of the issues of preservation and development of resources during the decade offered striking evidence against the American belief in the effectiveness of party turnover . . . An examination of

federal resource policy in 1956 reveals no substantial alteration in procedure or substance from 1946. The debate over centralism versus localism which raged at the beginning of the period proved to be directed not at the decision makers so much as at the polling booth (p. 201).

Richardson's history of resource policy under two administrations thus supports a conclusion suspected by many who have studied what Grant McConnell has called "the politics of land and water"; and that is that there is little substantive change and a lot of ideological debate in governmental resource policy. The same debates have continued throughout the 1960s and into the 1970s. It will be interesting to see whether the energy crisis, the food crisis, and the population crisis will force any significant modifications in federal policy.

The Indispensable Enemy: Labor and the Anti-Chinese Movement in California. By Alexander Saxton. (Berkeley: University of California Press, 1971. Pp. 293. $8.50.)

The anti-Chinese movement in the second half of the last century has often been interpreted as being economic in origin. According to this view, the anti-Chinese movement was a grass-roots phenomenon in which the mobilization of the white wage workers, farmers, and shop proprietors won the economic competition with the imported cheap Asian laborers. Professor Alexander Saxton has written this book to offer an explanation which is much broader than, but could incorporate, this cheap-labor argument. He contends that the California labor and party politics dictated the direction of the anti-Chinese course, and he has used historical evidence to illustrate the various political purposes which the Chinese labor issue served for the major proponents of the anti-Chinese movement. Thus, this book, a historical study of the labor movement in California and its relationship with the Chinese labor issue, presents an effort to put the anti-Chinese movement in the "right" perspective.

In the first of the book's three sections, Professor Saxton examines the ideological background of the anti-Chinese movement; he indicates that discrimination against Chinese in jobs and in the right to discover and exploit gold deposits was institutionalized since their earliest immigration. This discrimination reflected an attitude and behavior pattern which derived from the concept of white superiority, a concept stressed by the Democratic party through the years of its efforts to defend slavery and to stage a comeback after the Civil War.

In the second section, the national economic and political forces which shaped the course of the labor movement are carefully specified. Saxton also identifies the internal issues, the change of leadership, and the tactics each of the important anti-Chinese organizations used in campaigns against the Chinese laborers. Two major points are stressed here. First, the anti-Chinese stance was instrumental to the victory of the Democratic party in the 1867 California election, as well as the ascendancy of Kearny and the Workingman's Party, the election of Mayor Kalloch in San Francisco, and the recruitment of membership in California trade unions. Second, the anti-Chinese movement became institutionalized in California politics and in the structure of organized labor. As the author writes on the jacket blurb, the Chinese issue "penetrated all tendencies of political ideology from socialism on the one side to Republican on the other, and helped to cement an alliance in California between trade unionism and the progressive movement."

I find that the author, throughout the discussion in the second section, does not include adequate materials in dealing with the reactions, the coping style, and the defensive moves adopted by the Chinese laborers and their leaders. This leaves the reader wondering what Chinese did except to be persecuted and forced to move. Furthermore, I have some questions about the selection of materials. For example, it would have been appropriate for the author to discuss the reliability of the newspaper materials and to tell the reader what was the quality of newspaper reports. In any case, these are minor shortcomings. As a whole, the second section of the book is most interesting, informative, organized, illuminating, and amply documented, and it can be recommended to students of race relations or labor politics.

The final section of the book deals with the impact of the anti-Chinese movement. The author points out that the American Federation of Labor's racially exclusive policies against Chinese and other Orientals reinforced the exclusionary practices which were later directed to blacks in organized labor. Moreover, it furnished a race- or nationality-based argument for a later-adopted federal policy in restricting immigrants from Asia and some European countries. In short, the author examines the impact mainly on national policies. He should also have considered the effects of anti-Orientalism on the life experiences of Asian Americans, especially the segregation, isolation, and discrimination they experienced before and after World War II.

The Politics of Violence: The New Urban Blacks and the Watts Riot. By David Sears and John B. McConahay. (Boston: Houghton Mifflin Company, 1973. Pp. 244. $4.95.)

We are a decade in time and generations in consciousness beyond the events in Watts, but that riot or rebellion—the first of the truly big ghetto convulsions of the 1960s—is still a compelling subject for analysis. Consider, for a moment, its sheer magnitude. Sears and McConahay estimate that at least 31,000 adults took an active part in the disturbances at some point, a number which the authors note is equal to three combat divisions or to one and one-half times the maximum number of troops under Washington's command in the Revolution. Thirty-four people were killed in Watts, and more than a thousand were injured. The casualties amounted to more than double the American losses at the Battle of Bunker Hill.

The historical comparison is deliberate and not inappropriate: like Bunker Hill, Watts was in its own way a turning point, marking the end of the southern-inspired civil rights movement and the emergence of a new northern-generated militance. *The Politics of Violence* is a thorough attempt, based on survey data collected in the months following Watts, to explore from a social-psychological perspective the causes and some of the consequences of those six days in the summer of 1965. While the authors choose to call the events in Watts a riot (for that is the word most commonly used by their respondents and by the media), they are nevertheless fully cognizant of the symbolic implications of that term. But their central thesis—namely, that the riot was a profoundly political event, in effect a rebellion, rather than an aimless excursion for fun and profit—leaves no doubt where their sympathies lie.

The argument that the riots of the last decade were political rather than criminal manifestations is by now a familiar one. Indeed, many of the patterns revealed by this present survey will also be familiar to anyone who has followed the voluminous riot literature even in the most casual way. The virtues of this book, then, lie not in its often standard findings on the correlates and interpretations of riot activity in contemporary American cities, but rather in the complexity and implications of its theoretical perspectives.

The riot is viewed as a spark resulting from the conjunction in time and space of two vastly differently socialized populations: the new urban blacks and Southern California whites. The highest rate of riot participation, the authors observed, occurred among young blacks (under 30) reared in Los Angeles. The participation of this group significantly outstripped that of southern-reared blacks and migrants from other northern cities. Thus the authors hypothesize that there was a distinctive psychology at work among these new urban blacks, a product in part of distinctive childhood socialization which made them more likely to riot. They argue that the prevailing cultural forces at work in the *northern* socialization process in contrast to those at work in the southern socialization process were likely in the generation preceding Watts to produce greater political sophistication (hence greater sensitivity to unchanging levels of political and social equality), greater feelings of subjective deprivation (the young northern blacks' comparison levels against which they evaluate their own achievement are set higher), and more positive black identity. Combined with the perception that conventional mechanisms for grievance redress did not work well for blacks, as well as with a host of locally generated grievances against Los Angeles politicians, police, and merchants, these attitudes would conduce to riot participation.

The survey data establish the accuracy of this argument. The authors are able to show that a politically disaffected, sophisticated, subjectively deprived group with grievances specific to Los Angeles existed, that its members were socialized in Los Angeles, and that these characteristics were related to riot activity.

One of the strengths of this argument is that it offers a more airtight explanation of riot participation than the monocausal psychological theories like frustration-aggression or relative deprivation, which have seemed to give social scientists such trouble in the testing. Tracing the roots of violence back to presumed early socialization experiences, as well as resting the explanation on grievances growing out of adult experiences in the political system, provides a rich longitudinal perspective unmatched in this literature.

To establish the Los Angeles context the authors construct a much less complex theory of white socialization to explain what the authors see to be that city's pervasive "symbolic racism" (yet how explain the eventual triumph of Tom Bradley in an overwhelmingly white electorate?). This symbolic racism, manifested primarily by a common resort to abstract moralistic judgments about blacks as a group, is the consequence in the authors' view of white Southern California's familistic culture of privatism, racial isolation, and intense property consciousness. These aspects of life in the white southwest are seen in turn to be products of childhood socialization in the white Protestant middle-class Midwest, the place of origin of a disproportionate number of Southern Californians. All of these characteristics served to produce a massive

naiveté about blacks and a commitment to a set of Babbitt-like political routines and conventions irrelevant to and unconscious of the black condition.

The portrait of the Southern California whites does great justice to many of our presuppositions, but it is less successful than the portrait of the blacks. For one thing the authors present many fewer data to back it up. For another, the portrait seems a stereotype. Some of the writing here is just plain silly-sounding, as when they tell us that these "middle Americans" value "honesty" more than "human values." It is, Karl Lamb would surely tell us, a one-dimensional view that stresses the barbecue pit and crabgrass killer as the dominant cultural symbols. But in the end this is a relatively modest problem in an otherwise meticulously crafted book.

The most significant contribution this work makes in my view is not that it is the most ambitious single-riot study conducted from a micro perspective, but rather that it is one of the only efforts to explore adult political behavior as a function of childhood socialization experiences. The import of the socialization studies is that they purport to identify learning experiences in the early part of life which have consequences for adult political life. Yet the socialization literature is curiously devoid of studies of adult behavior which is related explicitly to the earlier socialization experience. Naturally, the lengthy time dimension involved in such an effort is a problem. One cannot easily observe his childhood subjects grow to maturity, although this type of analysis requires following in effect one age cohort over time. But what the researcher can do instead is to identify and examine cultural forces which bear on the growing up process which he presumes prevailed in the time and place of the childhood of his adult subjects. To do this, of course, is to simplify and to aggregate what is in fact a much more complex and differentiated set of experiences. It is also to make some potentially risky assumptions (with what degree of certainty, for example, can one claim to have identified what the important cultural forces were?). But if that enterprise is formidable, it is by no means impossible. Sears and McConahay have performed the task boldly and convincingly in this book.

PETER K. EISINGER
University of Wisconsin, Madison

The Uses of Disorder: Personal Identity and City Life. By Richard Sennett. (New York: Alfred A. Knopf, Inc., 1970. Pp. 198. $4.95.)

This book advances a novel and interesting thesis: the root of our contemporary malaise is urban planning, and the solution is to enforce a kind of creative anarchy on city life. I personally found the hypothesis improbable and the solution unappealing, but this is the kind of book in which evaluations are necessarily subjective. Those interested in the topic will want to read and judge for themselves. Fortunately, unlike many other social theorists with equally sweeping visions and wider fame, Sennett's prose is both lucid and fun to read.

Sennett believes life in America is pretty bad—sterile, intolerant, dull, narrowing, and violent. He locates the cause in an urban planning process that sees the city as a machine composed of interconnected parts and designs it so that the parts are separated except for functional interconnections. This results in social homogeneity in neighborhoods of the city and lack of contact among the inhabitants. The most deleterious effect of this style of organizing urban areas is that it reinforces the human tendency, experienced most strongly as a way of handling the adolescent identity crisis, to simplify and purify experience so that challenges are avoided and other people stereotyped and held at a distance. Moreover, Sennett feels that growing up in communities of this kind causes this disposition to "self-imposed slavery" to be perpetuated into adulthood. Only if the disposition is overcome in adolescence by social settings that "permit the young to act out their painless dreams [of a purified existence] and fail constructively" (p. 129) will individuals enter adulthood with the character structures that will enable them to deal with life in a creative way.

Sennett's argument is based on deductions from the psychology of Erik Erikson and a selected group of studies of aspects of city life (annoyingly, none of the studies is footnoted; on the other hand, they are clearly illustrations rather than evidence, so maybe it doesn't make much difference). Apart from the lack of empirical evidence—which is inevitable in this kind of a book—I found two problems with the argument (in addition to finding it intuitively unlikely). First, Sennett seems to me to mistake Erikson's psychology. Erikson regarded as unusual and pathological the kind of response to the adolescent identity crisis that Sennett identifies as typical in America. Second, Sennett is unclear about the genesis of the problem. He clearly believes things were not always this way but vacillates between regarding modern urban planning as the cause of unhealthy adolescence and identifying undesirable character structures as the basis of support for planning. Since Sennett's policy proposal calls for the re-creation of some aspects of the dense city life of the past, the former would make more sense. Yet, Sennett cites his own study of families in nineteenth-

century Chicago to indicate that the intense family life that he sees as producing an undesirable adolescence represented a reaction against the very urban disorder he proposes to reintroduce.

Sennett's policy proposal is to reproduce the density and disorder of the urban life of an earlier era through "survival communities" where people are forced to confront each other. "As a rule of change, the situations creating survival encounters would be as follows: there would be no policing, nor any other form of central control, of schooling, zoning, renewal, or city activities that could be performed through common community action, or, even more importantly, through direct, nonviolent conflict in the city itself" (p. 141). As an example, Sennett says, "If a bar down the street were too noisy for the children of the neighborhood to sleep, the parents would have to squeeze the bar owner themselves, by picketing or informal pressure, for no zoning laws would apply throughout the city" (p. 144). I personally do not find the vision of a society that deliberately creates unpleasant environments in order to encourage the formation of neighborhood T-groups an appealing one, nor do I believe that free time is so plentiful a commodity that we can afford to sacrifice it by giving up as much of the division of labor as Sennett proposes. Those who find life in America as sick as Sennett does and who find his diagnosis of the source of illness persuasive may disagree and opt for the "truly chaotic urban life" Sennett prescribes.

DAVID NEXON

Russell Sage Foundation

The Political Web of American Schools. By Frederick Wirt and Michael W. Kirst. (Boston, Mass.: Little, Brown and Co., 1972. Pp. 295. $7.95.)

This book has been needed for a long time. The field of "politics and education," as the authors note, is only gradually attracting the attention of political scientists. Additionally, among those few political scientists who do take an occasional look at schools, political socialization—as distinguished from educational governance—is the preferred agenda of research.

The great merit of this book is to place school governance within a framework normally applied to the *general* governing process. That is, they raise questions traditionally asked by political scientists and seek to answer them with the data available from studies of educational policy making. The framework which guides the book is, not surprisingly, systems theory. One might argue that the authors (one associated with a school of education, the other with a political science department) have thus guaranteed that nothing need be excluded, and that is not really the point. Systems theory is a link between two disciplines; it has been used (uncritically) by educationists while being the focus of a major debate among political scientists. Wirt and Kirst selfconsciously address themselves to both educationists and political scientists and have chosen a good device to gain the attention of both.

The survey of the literature is exhaustive. Virtually everything written on the subject at the time is included and fitted neatly into the organizational framework. The inclusive nature of the literature search, however, leads to two problems. First, the authors simply cannot answer some of the questions they pose. Second, their review of the literature is uncritical. No effort is made to point out some glaring errors in research. Both problems are probably excusable, especially the former. Much would have been gained, however, had the authors provided some estimate of the extent to which the reported research conformed to accepted standards of scholarship.

Aside from these relatively minor faults, the book has much to recommend it. It is relatively free of obfuscating jargon and is quite well organized. All levels of policy making (federal, state, and local) are examined. A particularly strong point of the book is the degree to which it continually draws attention to the major struggle in educational policy making: the clash between experts and laymen. In a system which pays symbolic deference to the ideology of lay control, reliance upon experts has become a way of life. Wirt and Kirst uncover scant evidence to suggest any but the most occasional exception to the power of the experts. They note, however, that the "new politics" of public education, with its clearly participatory thrust, is viewed as a serious threat by the "bureaucratic forces." An intriguing question is, of course, who will win? On these points, the book is suggestive rather than conclusive. Perhaps this is because there are no answers. If the authors contemplate any extension of their work, it would be extremely useful for them to attempt to identify the conditions under which bureaucratic domination is successfully challenged. I am confident that the book will receive the sustained attention it so richly deserves.

HARMON ZEIGLER

University of Oregon

A Grain of Mustard Seed: The Awakening of the Brazilian Revolution. By Marcio Moreira Alves. (Garden City, N. Y.: Doubleday Anchor Press, 1973. Pp. 194. $1.95, paper.)

Most of this book is not about revolutionary awakening, except of the kind which the author

himself has come to through his experience as a journalist, federal deputy, and exile. It is an account of repression, prefaced by autobiography and concluded with a strategy for overthrowing the system of repression.

Neither as history, nor as autobiography, nor as a program for liberation is the book satisfactory. But it is still worth reading. Many of its faults can be traced to the author's decision to write a popularized analysis of contemporary Brazil for a foreign audience. Within these limits, Moreira Alves largely succeeds. His book is free of the more simplistic ranting against bloodthirsty generals, profit-maddened capitalists, and the like. As introductory reading, it is a good companion piece to the recent Pelican paperbacks by two other Brazilian exiles—Miguel Arraes, *Brazil: The People and the Power* (1972), and Francisco Julião, *Cambão—The Yoke: The Hidden Face of Brazil* (1972).

As a serious chronicle of repression, however, the book is defective. In the first place, it is too sketchy. Better accounts can be found in the author's own previous (but untranslated) work: *Torturas e Torturados* (1966) and *O Cristo do Povo* (1968). Second, the analysis of economic repression and cooptation, fully as important to an understanding of Brazilian authoritarianism, is schematic and derivative. For some reason, Moreira Alves ignores the important work of Fernando Henrique Cardoso in this field.

As autobiography, the book is engaging, up to a point. Moreira Alves hardly sees himself as a Galahad of liberation. He questions his motives and casts a shrewd eye on his youthful naiveté. He is insightful about the functions of family connections and loyalties in Brazil. But I finished the book wanting to know more about Moreira Alves's personal development and, especially, about his experience in exile. The politics of exile is now a significant, and almost completely unknown, episode in the growth of Brazilian revolutionary thought. Moreira Alves, however, expressly states that "personal stories, though they may be of interest to clarify an evolution, are of little importance to the long popular struggle that is a revolution" (p. 3). This position is debatable, especially when the "impersonal analysis" which takes its place is hard to follow. But, to be fair, the book cannot be criticized unduly for omitting what the author did not intend it to contain.

It is as political analysis that *A Grain of Mustard Seed* is most puzzling. Moreira Alves's main conclusion is that armed struggle is "the only alternative the regime has left open" (p. 187). Resistance, therefore, depends mainly (or initially?) on this tactic. In one sense, the recommendation is plausible. Opposition from within the system has been virtually a total loss. But it can also be argued that violent opposition is the one avenue that the regime has completely blocked off. The mechanisms of physical coercion at the disposal of the regime are vast, terrible—and successful.

It is not clear how a policy favoring armed struggle follows from Moreira Alves's analysis. My guess is that the author knows more about physical coercion than about the varieties of economic, utilitarian control—a myopia which he shares with many humanistic Catholics in Brazil. Running through the book is the assumption that the economic system is so transparently exploitative, despite censorship and propaganda, that the government survives mainly on the basis of brute force and with the connivance of the United States. But the economic system is fairly clever; and, though Moreira Alves recognizes its cooptative ingenuity in general, he does not explore it in much detail. His analysis is not therefore convincing as a basis for calculated revolutionary action, even though a sound case can be made that the present situation may end with a violent upheaval. The strengths and the vulnerability of systems like the Brazilian can more rigorously be appreciated by consulting Hirschman and Rothchild's "The Changing Tolerance for Income Inequality in the Course of Economic Development," *Quarterly Journal of Economics*, 87 (November, 1973), 544-566, and Alejandro Portes, "On the Logic of Post-Factum Explanations: The Hypothesis of Lower-Class Frustration as the Cause of Leftist Radicalism," *Social Forces*, 50 (September, 1971), 26-44.

PETER MCDONOUGH
University of Michigan

Developmental Personnel, A Psycho-Social Study Across Three States in India. By B.C. Muthayya and I. Gnanakannan. (Hyderabad: National Institute of Community Development, 1973. Pp. vi, 185. Rs. 25.)

This study reports the results of a comparative survey of Indian Community Development administrators' background and psychological characteristics and the relationship of these factors to job satisfaction. The fact that the survey was conducted by the National Institute of Community Development may be interpreted as a reaffirmation by the Indian government of the importance of the administrative component in the development effort; in the recent past much attention has focused on Panchayati Raj, the political component. Students of administration will welcome the book for this reason, as well as for the massive amount of data that was gathered. Unfortunately, however, limitations in the

authors' analysis and presentation prevent readers from reaping the full benefits of this major research effort.

The authors begin by making the assumption (perhaps less true in employment-scarce India than elsewhere) that "one's job performance is, to a great extent, influenced by one's level of satisfaction on the job" (p. 7). Their goal is to identify the personal and psychological variables that produce job satisfaction in the hope that recruitment and training practices can be changed to produce more satisfied and productive administrators.

The survey was conducted in 1970 in Mysore, Tamil Nadu, and Kerala states. Data were gathered from 791 administrators who worked in 271 blocks at varying development stages in 18 of the 42 districts in these states. Specifically, 225 Block Development Officers (BDOs), 133 *mukhyasevikas,* 240 *gramsevaks,* and 193 *gramsevikas* participated in the study. Data were also gathered from 91 senior rural service college students in Tamil Nadu for comparison with the data collected from this state's administrative sample. Finally, 411 job performance evaluations were gathered from collectors, district development assistants, and BDOs in the sample. The first two groups evaluated the BDOs, and the BDOs evaluated their subordinates who participated in the study. The investigators used a mail survey and visited sample blocks to insure that schedules were properly completed. The schedules were tailored to suit administrative roles and asked both closed and openended questions. The closed-ended questions related to participants' backgrounds, personality variables, job satisfaction, social intelligence, and satisfaction with their assigned community. Openended questions probed attitudes about the Community Development and Panchayati Raj programs.

After the introductory and methodological chapters a deluge of data is presented without much analysis. Almost a hundred tables are presented in the 110 pages that cover the chapters reporting the closed-ended data on respondents' background characteristics, their response to various personality and job satisfaction measures, and correlations between background and personality variables and job satisfaction. Much of the accompanying text merely restates data apparent in the tables without interpretation. For example, the authors report that significant portions of the respondents occupied their present positions before the initiation of the Panchayati Raj Program and that many were recruited from the Revenue Department. But they do not suggest how these previous experiences may affect their relations with the elective representatives of this program.

Further, the authors do not explain how ecological differences between the states may account for differences in responses. For example, what is it about the Mysore setting that explains why BDOs there have higher job dissatisfaction scores relative to those of BDOs in the other states? No recognition is given to the South Indian focus of the study or how the findings might relate to other areas of India. This lack of analysis is particularly disappointing because one would expect Indians to have greater insight into these questions than Westerners who work from a different cultural base.

The next chapter discusses administrators' opinions about the Community Development and Panchayati Raj programs. The openended responses were organized by role into four categories—attitudes about administration, training, Community Development, and panchayats and elected representatives. No tables are presented here, although often they would have been more appropriate than the text, which is a quantitative description of the findings. Particularly in this chapter, the authors missed an opportunity to focus and analyze their data because of their failure to include quotations from the participants' openended responses.

Finally, the last chapter summarizes the findings and devotes two pages to the presentation of eleven suggestions. Consequently, the suggestions are vague and merely identify some issues related to job satisfaction. The wealth of data discussed in the book is not adequately used to support these suggestions or to specify how changes could be made to enhance satisfaction.

The book represents a hopeful start toward understanding the attitudes and behavior of Indian development administrators. One has the impression, however, that the book was published quickly and without adequate thought about how the data could be most usefully presented to other scholars. In addition, the authors should have included a copy of the questionnaire and noted references for the various scales that were used, such as the nine personality measures. Finally, an effort should have been made to place the study's findings in perspective by referring to other administrative studies. One hopes that the authors will provide more analyses of these rich data in the future.

DAN FRITZ

Leonard Davis School of Gerontology

The Hero's Children: The Post-War Generation of Eastern Europe. By Paul Neuburg. (New York: William Morrow and Company, Inc., 1973. Pp. 383. $2.95.)

The Hero's Children is about social change in

Eastern Europe since World War II and particularly, since the death of Stalin, about the relationship of the Party to the people, and especially the young. It also addresses itself to the general problem of how stable the regimes in question are and how the ideologically generated processes of modernization affected the population and its political attitudes. Throughout, Neuburg, a writer and journalist, compares Poland, Hungary, Czechoslovakia, Rumania, and Bulgaria in regard to the issues raised. His book is an ambitious undertaking based on the author's travels in Eastern Europe (undertaken since 1968), his knowledge of the area because of his background (a Hungarian "56-er") and recent sociological surveys and other relevant literature coming out of Eastern Europe. The author has an obvious "feel" for the area, enhanced by his many conversations with the natives during his visits.

Neuburg has been most successful in conveying "the daily life and concerns" of young people in Eastern Europe (especially in Chapter 6, "Ways of Life"). At the same time his enterprise falters when he intends to provide a somewhat grandiose and overambitious conceptual-theoretical scheme, embodied in what he calls the "central idea" of the book, namely "of the Party as Hero and the young as the Hero's Children."

The idea of the Party as Hero and the youth as its children seems to me to be contrived, adding little to clarify or focus the main concerns of the book. "Heroic" means, apparently, ideological as opposed to pragmatic. The lack of clarity is illustrated by such propositions as: "It is however only in theory that the Party may pose for ever on the one hand as the Vanguard of Perfection and Rationality Incarnate and on the other as History's Hero and the Champion of Progress. In practice, as both the Being static at the centre of all affairs and the Motor of Becoming inexorably productive of change, it is bound to become ensnared by just the dialectics it thought itself destined to command on behalf of the future" (p. 56).

If one overlooks such cumbersome theorizing, many interesting points and concerns emerge. Perhaps the most important, which transcends Eastern Europe and its younger generations, is the relationship between materialism and idealism, affluence and political liberalism, improved standards of living and rising nonmaterial aspirations. These issues have been raised and debated frequently in the Soviet context, but at present they are more appropriate to Eastern Europe. The issue may also be posed as the degree of interdependence between the political-ideological and economic spheres. The author, like many Western social scientists, believes that the developing economic arrangements and institutions of Eastern Europe are less and less compatible with high levels of centralization, ideological constraints, and the still prevailing authoritarian superstructures. "As specialists take over one specialized function after another, and as each new generation becomes better at managing for itself, so the State, while remaining a live body, will cease to have any room for the Party as its centre" (p. 361). It is the familiar proposition of the apolitical specialists squeezing out the die-hard ideologues, and if true, it has vast implications. Yet, especially for a sociologist aware of the functionalist perspective, it is hard to conceive of a society run by such pragmatists without another elite stratum elaborating and dispensing some set of values which transcend the instrumental concerns of the specialists.

Nevertheless even those like myself who are skeptical about such ideas, usually subsumed under "convergence" or "modernization," must concede that there is something to them, especially in regard to Eastern Europe. Of course it is not easy to determine why Eastern European societies are becoming more "Westernized": is it because they have become more urban, industrial and productive, or is it because their historical traditions and values, geographical conditions and cultural contacts have been different? In any case, one aspect of modernization and convergence can hardly be disputed. It is the growing similarity between the social problems—crime, delinquency, family instability, various forms of escapism, pollution, etc. —that urban, industrial societies create, notwithstanding their different political arrangements. The same applies to our old Western favorite, alienation, more elusive yet hard not to recognize when encountered under socialism as much as under capitalism. Yet critics of Western societies rarely suggest that high levels of scientific, technological, and industrial development, and the attendant complexity, provide barriers to antidemocratic tendencies or trends. Quite the contrary, they are often seen as merely providing better tools for the manipulation of the masses, or devices for lulling them into a false sense of security and satisfaction with their lot.

While many of the major speculations and projections of the book are difficult to substantiate, there is an abundance of interesting information and insightful comment about the attitudes of East European youth. These very attitudes lend themselves to divergent interpretations about their contribution to the long-range political stability of the systems involved. Thus we learn, or are given fresh evidence and examples of, the pervasively apolitical attitudes of the

young, their intense materialism, consumer orientation, cynicism about political ideals and ideologies (and especially the official ones), their achievement orientation, their support of authority even when mixed with disrespect for its prevailing ideological legitimations. We also learn that, "Instead of wholly destroying former conventions, change and the effects of the Party's social policy have combined to spread formerly middle class attitudes through almost the whole of what now counts as society" (p. 242). Sociological surveys cited further, indicate that "Occupations are . . . rated by the majority much less according to the satisfaction they offer than according to the money they bring in" (p. 273).

The young are not in the mood to challenge authority or to harbor extravagant expectations concerning either political freedoms or social justice or spiritual fulfillment. The young generally doubt the value of revolutions (p. 276). A Polish student summarized prevailing attitudes: "We don't dream of shaking off the yoke. Only of making it more bearable" (p. 319). While these attitudes in their somewhat paradoxical combination are not apt to please the Party, neither do they seriously threaten its power in the foreseeable future. It will probably take a long time before either material expectations become so intense as to be incapable of satisfaction, or their satisfaction will lead to the type of spiritual quest and restlessness that characterizes large segments of the young in Western societies. But even if that were to occur, both the surviving traditions of the area and the watchful eyes of Big Brother to the East will, in all probability, constrain the forces pressing for radical change.

PAUL HOLLANDER
University of Massachusetts, Amherst

The Making of an Australian Prime Minister. By Laurie Oakes and David Solomon. (Melbourne: Cheshire, 1973. Pp. 318. $A3.50, paper.)

This is the tale of how heroes make history, a gossipy but readable account of the events which brought Gough Whitlam to power in December 1972, the first federal Labor government in Australia since 1949. Laurie Oakes is political correspondent for the Melbourne *Sun* and David Solomon is political correspondent for the *Canberra Times*.

Quite simply, this is a story of the events which changed the demoralized party of 1966 into the victors of 1972, with their promises (or threats) to create a Sweden in the South Seas. The book offers a useful summary of this period. It contains important clues for deciphering Australian politics: splenetic personal feuds, veto groups, endemic localism, the mild chicanery of the partisans, the substitution of trigger words and the gut reaction in the absence of anything resembling ideological conflict. It is a reminder of the Labor party traumas between 1967 and 1971, of the sheer bumbledom of the Coalition's closing years, and the bizarre qualities of Australian political leadership. It conveys color and it contains an amount of useful detail, names, figures, events. It demonstrates again that the best informed observers of current politics, and the most active, are the lobby correspondents. The problem is how to put their talents to better use.

For the tone of the book is also a comment on the poverty of political debate in Australia. Ideas and philosophies are subordinated to the task of detailing the gloss and the marginalia of the campaign. The authors' brushwork is deft but without much depth in theme or structure. The book deals mainly with the curiously self-conscious power-play of a small group of individuals as recorded by the media. Ideas or policies of any kind are scarcely discussed. This is unfortunate because social issues were of growing and perhaps decisive importance in the outer suburban electorates of Sydney and Melbourne. The rise of an "ideology of concern," heralding perhaps some change in the traditional, materialist affiliations of the Australian electorate goes largely unrecorded. The book does not attempt to develop the explanation of the social and political significance of the incidents it chronicles. Its content is also a commentary upon what the media see and report in Australian politics. It serves itself as a carrier of traditional beliefs and ideas about politics. Initially attractive, the book's failure to do more than speculate and generalize finally becomes tedious. Even in politics, the human element becomes boring when it is left so entirely to its own devices. Despite its title, this is not of the same species as the "Making of a President" series.

Oversimplified history of this kind produces distortion. The authors fall victim to the deceptive simplicity of their own narrative. Some issues are not fully developed: the significance of the changing class composition and outlook of the Labor party under Whitlam; the tensions within the Unions in Labor's thrust for power. More seriously, discussion of the campaign as a power-struggle is too one-sided; Liberal leaders are presented as strolling actors surprised to be caught on stage when the curtain went up. The story of how a government crumbled and power slipped through the fingers of the exhausted men in office is told too baldly. Also, for a man whose ascent to power was apparently predestined, Whitlam remains himself a shadowy figure.

Admittedly, this is asking the book to be something it was not meant to be. Yet if we accept the book uncritically at face value we run a hidden danger: Australian readers may too readily accept the deceptive simplicity of the narrative. The book's flaw is making a major (even momentous) political event seem so obvious as to require no further explanation. The fact that it was "time," as the slogan went, was enough. For a political system whose own political vocabulary and imagination is limited, the plausible rationalizations which this book presents should not be substituted for a genuinely critical attempt at explanation and understanding.

Modernization and Bureaucratic-Authoritarianism: Studies in South American Politics. By Guillermo A. O'Donnell. Politics of Modernization Series, No. 9. (Berkeley: Institute of International Studies, University of California, 1973. Pp. 219. $3.25, paper.)

The key to a fair appraisal of this publication by O'Donnell is to be found in the first sentence of the preface where he states, "I wrote this work while doing graduate study in political science at Yale University" (p. vii). He does not call it a book and this is indeed accurate, since *Modernization and Bureaucratic-Authoritarianism* lacks not only an introduction and an index but also integration. The publications in this series are apparently not intended to be finished products, but rather tentative contributions to the discussion of Latin American topics. Throughout the work O'Donnell emphasizes the preliminary character of his findings. An equally significant point in the above quotation concerns the university where the author did his graduate work in the United States. It should be noted, however, that O'Donnell, an Argentine, has also done advanced study in Latin America and has published in Spanish.

This publication is a collection of four essays in which the author applies some approaches from his graduate training to the study of Latin America. The work would be iconoclastic were it not that the images attacked here are scarcely taken seriously anywhere today. O'Donnell probably did clear the conceptual ground as he intended, but the reader is obliged to waste a great deal of time while the author fiddles around with approaches of dubious utility for the study of Latin America. The annoyance is most serious in the first part of Chapter I (and a point frequently returned to) where he takes up the old argument that more socioeconomic development leads to more political democracy. O'Donnell knows full well, and the reader need not be reminded, that this finding has little support in Latin America. This same sort of exercise is undertaken throughout Chapter IV where he applies some elements of game theory to the study of party competition in Argentina. It is obvious from his caveats and the manner of applying the model that he could have come up with the same conclusions without bothering with the approach. It is, as he notes, an impossible game in Argentina, and one does not require much theory, let alone axioms, to know this.

More must be said about the preliminary nature of this work and of the author's intentions in writing it. He is apparently attempting to clarify concepts and determine the types of relevant data in order to carry out empirical work. This publication is not, therefore, a contribution to data or new material, but rather an effort to deal with existing information in sorting through various approaches. In order to clarify his argument O'Donnell frequently uses propositions and hypotheses which indicate where he is going, but as could be expected, not enough material is available to test them. And this is in spite of an abundance of footnotes which makes for very hard reading. Because of the tentativeness of this exercise, its conclusions must be viewed with skepticism. For instance, on page 51, O'Donnell argues that political democracies are found at intermediate levels of modernization. Since Chile and Uruguay are at this level, and are no longer democratic, one concludes that a proposition has been disproved. However, on page 114 he notes that the chances for survival of the democracies are not good. In short, he cannot be directly contradicted because the work is highly tentative, is not integrated, and is not meant to constitute a single argument.

Insofar as any theme dominates the work, it is the relationship of modernization and political systems. The author argues that in Latin America the size of the domestic markets and the productive structure of the modern areas are the major determinants of social differentiation. Increased differentiation means greater social complexity, and political pluralization is the political expression of this differentiation. O'Donnell finds that the Latin American countries differ on the dimensions of this differentiation and these in turn both directly and indirectly determine the three patterns of political system he defines. He then does historical, and largely structural, analyses of Argentina and Brazil and concludes that at high levels of modernization there is an elective affinity for what he terms "bureaucratic-authoritarian" regimes. These regimes are characterized by the growth of organizational strength of social sectors, governmental attempts at control by "encapsulation,"

the career patterns and power bases of most incumbents of technocratic roles, and the pivotal role played by large bureaucracies (p. 95). His argument is supported by abundant evidence and is depressingly thorough and accurate in the case of Argentina. The argument is persuasive enough in general, although less so in the case of Brazil, but many readers will probably quibble over the definitions and measurement of both modernization and the types of political systems. This is a far-reaching argument, and I expect that O'Donnell will both modify and strengthen it in his present empirical work.

This is a useful work for those interested in the politics of Latin America. It is not easy to read and the argument is complex and partial, but O'Donnell has done an impressive job of both stating the conceptual problems and bringing together much of the material by which they might be studied and perhaps even solved.

THOMAS C. BRUNEAU

McGill University, Montreal

The Price of Liberty: Personality and Politics in Colonial Nigeria. By Kenneth W. Post and George D. Jenkins. (New York: Cambridge University Press, 1973. Pp. 494. $27.50.)

This is a political biography of Alhaji Adegoke Adelabu, son of Ibadan and erstwhile Leader of the Opposition in the Western House of Assembly in the period preceding Nigeria's independence. Though he died in a car crash in 1958, at the age of forty-three, Adelabu's career sheds much light on the nature of opposition in the Western Region and on the decline of the NCNC as a nationalist party. The subtitle of the book, however, is misleading because this is not a study of Adelabu's personality on the order of the George's study of Wilson, say, or of Tucker's study of Stalin.

Though the authors had the great good fortune to have access to their subject's private papers—which allows them to weave a fascinating story in meticulous detail—nowhere do they attempt to interpret Adelabu's motives or style outside of the period and of its political exigencies. Adelabu's appeal, however, derives as much from his puckish sense of humor and his roguish ways as it does from his political skills! "I am humbler than Shaw, physically stronger than Gandhi, more cultured than Stalin, older than Jesus, more educated than Shakespeare, more worldly-wise than Socrates and better tailored than Lincoln" (p. 123). Making no reference to personality theory and seemingly not steeped in Yoruba culture and rhetoric, the authors are alternatively admiring, amused, and appalled by their subject, but nowhere do they help us to understand his style.

The strength of *The Price of Liberty* lies in its political history of regionalism as experienced by one who opposed its triumph. The decade of the 'fifties saw a retreating imperialism mesh with indigenous forces to construct a federal framework based on narrow communal and sectional interests. This arrangement came to be called the "Regionalist System" and it was to have disastrous results for Nigeria. Adelabu opposed regionalism from the first, partly because he was a nationalist resisting centrifugal forces, but mostly because he was a son of Ibadan, and saw in the dominance of the Action Group the decline of his power in his own constituency. The logic of the situation—not his personality—led him to align himself with the opponents of the Action Group, the NCNC and its leader, Dr. Nnamdi Azikiwe.

But beyond Adelabu's own political machinations there is the fascinating story of decolonization in Nigeria. Here the authors make an important contribution by filling in and correcting in significant places the landscapes left for us by earlier works of Coleman, Sklar, and Post himself. Taking Adelabu's point of view, for example, they show that the break between the Western branch of the NCNC and the national party occurred as much from the vacillations of the national leadership and its attempt at compromising its fight with the regionalists as it did from Yoruba suspicions of Ibo dominance. The impression, therefore, that the NCNC was doomed to become a regionalist party like the NPC and the Action Group, and that communalism was fated for Nigeria would seem not to be justified by the data presented by Post and Jenkins. This is an important point, as this study of Adelabu makes clear, and it is one that ought to be more fully discussed in a separate study of Dr. Azikiwe.

ROBERT MELSON

Purdue University

Revolution and Politics in Russia. Essays in Memory of B. I. Nicolaevsky. Edited by Alexander and Janet Rabinowitch with Ladis K. D. Kristof. Russian and East European Series Vol. 41, Russian & East European Institute, Indiana University. (Bloomington and London: Indiana University Press, 1972. Pp. xii, 416. $12.75.)

The late Boris Ivanovich Nicolaevsky was probably the most learned, imaginative, prolific, and influential historian and analyst of the origins and development of Bolshevik rule in Russia of our generation. This volume was originally planned as far back as 1965 as a *Festschrift* to be

presented to him on his eightieth birthday, 20 October 1967. But the completion of the volume, which includes many detailed and ambitious contributions, was delayed. Nicolaevsky's death on 21 February 1966 resulted in the transformation of the projected *Festschrift* into a memorial volume, which did not see the light of day until over six years later. It was fitting that the Russian and East European Institute of Indiana University, which is now one of the leading centers of Russian studies in the English-speaking world, should have sponsored the volume.

Boris Nicolaevsky, whom hundreds of students of the Russian revolutionary movement (including this reviewer) remember with deep gratitude for his help as well as with respect and affection was born on 20 October 1887, in a small town in the foothills of the Urals. He was the son of a priest. Like many of his idealistic contemporaries, he began his revolutionary activities while still at school, and was arrested at the age of sixteen. His formal education ended at this point: for the rest of his life in Russia until his arrest and expulsion in 1921, he continued intensive study of Russian social and political conditions and history and of the revolutionary movement and actively participated in the social democratic movement. Nicolaevsky was at first inclined to side with the Bolsheviks after the split in the party in 1903, but, as Professor Ladis Kristof points out in his excellent contribution ("The Formative Years") this was due much less to ideological reasons than to the fact that "the Mensheviks were universally blamed for the split" (p. 13). (The historian now in possession of more facts can only marvel at this early success of Bolshevik propaganda.) Professor Kristof's account of Nicolaevsky's political activities up to 1917 is of particular value not because Nicolaevsky's political career was as important as those of the major figures in the Menshevik ranks, but because it too displayed the fairness and objectivity which always characterized Nicolaevsky's judgment as a historian. He certainly did not hesitate to condemn actions which he thought were detrimental to the aims of the social democratic movement. But a political opponent did not automatically become *caput lupinum* for whom no good word could be said, nor did an ally escape criticism when he was deemed to deserve it.

In exile Nicolaevsky continued, indeed much expanded, his scholarly activities. He remained in Europe until 1940, when the advance of Hitler's forces on Paris drove him into a second exile, the United States. He had meanwhile amassed a unique collection of all kinds of rare and unpublished materials on the Russian revolutionary movement. It comes as a shock to those of us, like myself, who remember Boris Nicolaevsky's apartment in West Side New York bulging with documents, files, and packages to learn that the major part of his collection was lost in Paris. According to the late Professor Moseley, Anna Mikhailovna Bourgina, later to become Mrs. Nicolaevsky, "risked her own life by remaining behind in occupied France (after Nicolaevsky's departure) in order to safeguard the collection" (p. 33). The major part of the collection was, however, discovered by agents of the Alfred Rosenberg office and transferred to Frankfurt, to the Institute on Judaism and Bolshevism. In the confusion at the end of the war, when these materials were discovered by an American lieutenant, he (reportedly) handed them over to the Soviet authorities because they were mostly printed or written in Russian, and they were promptly shipped to the Soviet Union. We learn these facts from the article on "The American Years" by the late Philip E. Mosely who died before this volume saw the light of day. It was indeed Mosely who, more than anyone else, made it possible for Nicolaevsky to live and work first in New York, then in California, for twenty-seven years, writing, advising younger scholars, and continuously rebuilding his collection of materials. This collection remains one of the most valuable sources on Russian revolutionary history in existence outside Russia. The bulk of the collection is now at the Hoover Institution on War, Revolution and Peace at Stanford University, where Mrs. Nicolaevsky has continued the work of indexing and annotating it. More than ten thousand items from the collection are in Indiana University Library.

The "Selected Bibliography" contributed by Anna M. Bourgina (Mrs. Nicolaevsky) is of the greatest value. It makes no claim to completeness, because Nicolaevsky's contributions to socialist periodicals were so numerous that they can probably never be fully listed. Even so, Mrs. Nicolaevsky has listed his articles and reviews from the main periodicals to which her late husband contributed in eighteen closely printed pages. These include both Nicolaevsky's ephemeral comments on current events in the Soviet Union (which were usually better informed and more perceptive than those of anyone else, as events later confirmed) and detailed historical studies based on much research. The bibliography also lists the main books—on Azev the spy, on Forced Labor, on Marx, and the invaluable annotated editions of papers and letters of Axelrod, Martov and Plekhanov, among others. It is worth adding one of Nicolaevsky's main works which does not appear in the bibliography: it was regrettably never published for lack of funds, even though funds have so often been forth-

coming for less worthy publications. This work consists of the first six volumes (this was as far as he had got when he died) covering the least studied period of Russian social democracy—between 1906 and the First World War. The completed volumes are deposited in typescript in several libraries and go up to 1912. They consist of unpublished documents from the author's own and from other collections with extensive introduction and commentary. These volumes throw an entirely new light on the history of the period as traditionally reiterated by a generation of historians.

The remaining fourteen contributions span a period of more than one hundred and fifty years —from a study of Andrei Turgenev (Raeff) to one on the vital CPSU Praesidium meeting of February 1961, the evidence on which is dissected with great ingenuity by Robert M. Slusser. The span of time and the variety of subjects, every one of which would have interested Nicolaevsky, and on every one of which he would, had he lived to see this volume, have had penetrating comments to add, are an appropriate tribute to his scholarship. Equally appropriate are the scholarship and high standard of all the contributors. The reviewer of a symposium is invariably faced with the problem of either selecting unfairly or giving a catalogue. Two outstanding articles can be passed over, however, because in each case, since they were written, the author has published an important volume which embraces the subject of the earlier article—Robert C. Tucker on "Stalin's Revolutionary Career before 1917," now in part covered by the first volume of his monumental biography of Stalin; and Stephen F. Cohen's "In Praise of War Communism: Bukharin's 'The Economics of the Transition Period,' " which is now also dealt with in Cohen's splendid biography of Bukharin. The other subjects covered are the Group for the Emancipation of Labor (Frankel), Russian and Jewish Social Democracy (Wildman), Marxist Revolutionaries and the Dilemma of Power (Getzler), the Railwaymen in the General Strike of 1905 (Sablinsky), the Social Democratic Movement in Latvia (Kalnins), the Petrograd Garrison and the Bolshevik Seizure of Power (Rabinowitch), the Berlin Conference of the Three Internationals in 1922 (Sukiennicki), the Kaminsky Brigade (Dallin), the Rehabilitation of Pokrovskii (Keep), and a Possible New Soviet Model of Modern Society (George Fischer).

So much for the catalogue of what is to be found in this important publication in the field of Russian revolutionary history and of the Soviet Union. Without wishing to be invidious in selecting particular articles for emphasis, I think it is important for readers of the *APSR* to know which particular articles open up new ground, in the sense that they are the result of research on unpublished or very little known material. Professor Marc Raeff's contribution on "Andrei I. Turgenev and his Circle" falls into this category, since it provides new information on the least known of the three famous Turgenev brothers, Andrei, who died at the age of twenty-two in 1803 before he could achieve the fame of his brothers Alexander and Nicolai, but who was probably very typical of the enlightened generation of young Russians of good family at the turn of the nineteenth and eighteenth centuries. Professor Raeff sees in him and his circle forerunners of Stankevich and his circle thirty or forty years later and has some very perceptive things to say on the subject. Then there is Professor Kalnins' contribution on Latvian social democracy, although not based on unpublished sources, makes extensive use of Latvian language sources which few historians of Russia can read. Lastly, there is Professor Dallin's study of the Kaminsky Brigade—not because of the importance of the episode in the Second World War, but because this is the first published study of the result of extensive research in the German wartime archives. Kaminsky, as Professor Dallin says, was a persistent Soviet type, combining "ability and arrogance, ambition and mediocrity, nihilism and conviction" (p. 280). He and his brigade ended as little more than bandits: his main contribution to the far from simple story of Russian collaboration with the Germans in the Second World War has been to enable Soviet propaganda, Western gullibility and plain ignorance to combine to tarnish the reputation of the genuinely idealistic, if misguided movement associated with the name of Vlasov. It is much to be regretted that many more fine contributions to this book should have had no more than a mention in this review.

LEONARD SCHAPIRO
London School of Economics

Scandinavian Political Studies, Vol. 8/1973. Edited by Stein Rokkan. (Oslo: Universitetsforlaget & Beverly Hills and London: Sage Publications, 1973. Pp. 286. $15.00.)

What distinguishes *Scandinavian Political Studies Vol. 8* (edited by Stein Rokkan with the assistance of Helga Hernes and Helen Aareskjold) from the previous volumes of the Nordic political science associations' yearbook, is the number of articles which deal with the penetration of national by international politics. Several deal explicitly with *the* major recent event in four of the five polities (all but Iceland)—the strategy toward and decision about the European Community.

Three papers discuss the relationship between situation and strategy. Knud Midgaard, Halvor Stenstadvold, and Arild Underdal (Oslo) analyze "political interlocutions." Do not be put off by the unfortunate terminology; interlocution, a term taken from philosophy of language, is used here to group for analytical purposes diverse phenomena, many of interest to political scientists: debates, negotiations, conversations, dialogues. In the spirit of Erving Goffmann and Thomas Schelling (who although respectively from sociology and economics coincide in their emphasis on the structure of situations in which actors operate), Midgaard et al. begin "a systematic study of the situations political actors confront when participating in debates and negotiations. . . ." In examining the familiar category "time," a distinction is made between "time available for negotiations" and "time in relation to other events and processes." Short time available is said to favor such games as "chicken," longer time, games of attrition. Likewise, for the usually vacuous concept of "context" are substituted analytically useful subcategories which alert us to the actual or potential consequences of our negotiations for other actors (who, therefore, might be tempted to try to affect them).

Related in spirit, although very different in technique, is the investigation by Bo Bjerulf (Lund, Sweden) of the impact of formal voting rules on strategic dispositions of actors. It aims to "establish the strategic potentials and other properties of two common voting procedures and to discuss the potential effects of these properties on parliamentary decision making." Carl-Einar Stalvant (Stockholm) examines the recent negotiations between Sweden and the Common Market. His account confirms that the Swedish decision makers *either* misunderstood the nature of the Community, underestimating the seriousness of its political aspirations, *or* planned their diplomatic strategy *as if* those assumptions were true in the hope or on the chance that favorable results could be obtained.

A second group of articles deals with the impact of the international environment or of foreign policy choices upon domestic politics. Jørgen Elklit and Nikolaj Petersen (Århus, Denmark) note that the referendum on the EEC elicited the highest turnout ever (90.1%) in Danish elections. Henry Valen (Oslo) shows that in the Norwegian referendum the turnout rate was 5% *below* the previous election; he found that turnout varied with degree of *local* unanimity. The relatively unified (anti-EEC) environments in the periphery resulted in extraordinarily high mobilization; the center was generally less homogeneous, reducing participation rates (although in homogeneous—pro EEC—wards in Oslo, turnout was also high). The net effect was to reduce the traditional disparity in participation between center and periphery. Ottar Hellevik and Nils Petter Gleditsch (Peace Research Institute-Oslo) attribute the periphery's uncommon influence instead to what they believe to be the relatively better position of peripheries (geographical and social) under direct, rather than indirect, representation. Also dealing with the interpenetration of foreign and domestic politics, Kari Sulevo (Helsinki) attempts, with the aid of content analysis of Finnish press editorials, to connect changes in the international system with changes in Finnish attitudes towards a Nordic grouping. While the thesis makes good sense—the postwar history of the other Nordic countries also suggests that the Nordic option is a function of the opportunities available in the wider international environment—this excessively abstract and largely impenetrable article fails to make a convincing case. Finally, the review of the leftward shift in Icelandic politics by Olafur Grimsson (Iceland) indicates the part played by the fisheries-limit and defense treaty issues in internal politics there.

Risto Alapuro (Helsinki) makes a stimulating comparison between the ideologies and political impact of nationalist-fascistic student movements in interwar Finland and Roumania. He uses Lipset's idea of the attractions of fascism for deprived groups and Gusfield's concept of "status politics" to account for student ideologies. The decline of the status of bureaucrats in newly independent and relatively democratized Finland was significant to students, largely oriented toward bureaucratic careers. Similarly, in interwar Roumania the vast and rapid expansion of higher education was far beyond what could be absorbed. In both countries student ideologies were "populist," looking for support to the peasantry. In Finland, for example, the organized student movement, which immediately after the civil war had recruited from both Swedish-speaking and Finnish-speaking students, by the mid-1920s became a Finnish-speaking movement leading a struggle against the "Swedish upper class." Alapuro argues that this is status politics. But we have penetrating hypotheses by Albert Breton and Harry Johnson to shed light on such situations, showing the "rational" (interest-connected, goal-connected) elements in what seems purely status politics. In this case one would guess that the competition with Swedish-speakers for jobs, particularly bureaucratic jobs, was a not negligible factor. The appeal to the peasantry, or to the nation, becomes a tool in elite rivalry.

Alapuro also argues, correctly in my view, for the possibility of separate explanations of the sources of leadership for, and mass support of, a movement. He turns to Barrington Moore for an explanation of the varying resonance of similar ideas in different social settings, and concludes that the "structure and social importance of the peasantry" determined the depth of response to fascism in Roumania and its transient nature in Finland. I hope that such fascinating comparisons of the political development of the Nordic countries, comparisons with outside countries as well as each other, will continue to be central in *SPS*.

Election and media studies are "traditional" in *SPS*. An interesting conclusion from the study of party identification in a multiparty system by Ole Borre (Århus) and Daniel Katz (Michigan) is that if the "bourgeois" and "socialist" parties in Denmark are grouped together, and if party identification is taken to mean identification with the bloc, then it is a better predictor than in U.S. election studies. Claes-Olof Olsson and Lennart Weibull (Göteborg, Sweden) argue that the "gatekeeper" concept in communications research needs to be more closely tied to the political system; they suggest more weight instead on "national conceptions of news." Since their data deal with the reporting of news in Scandinavia, it would be interesting to test their contention in less consensual systems as well.

There is great variation in the readability of these articles. One of the purposes of publication in a world language is to gain a wider audience for the excellent research done in the Nordic countries—and in its short history *SPS* has succeeded remarkably; one may hope, therefore, that more resources will be devoted to editing for clarity of organization and expression, minimization of abstract terminology where possible, and sufficient concreteness in background and illustration to make the contents readily understandable to foreign readers. *SPS* has an indispensable analytically organized annual bibliography.

BARBARA G. HASKEL

McGill University

Authoritarian Brazil: Origins, Policies, and Future. Edited by Alfred Stepan. (New Haven, Conn.: Yale University Press, 1973. Pp. xi, 265. $10.00.)

This is unquestionably an important book, containing rigorous and systematic analyses, yet it frustratingly adds up to something less than the sum of its individually quite impressive parts. Its basic concept is not to be faulted: a symposium, held on the occasion of the seventh anniversary of the Brazilian military's seizure of power, in which a select group of social scientists probe the nature and dynamics of the system which had emerged between 1964 and 1971. Fully competent in describing concisely what had occurred to that point and generally sound on important questions of causation, the participating scholars have met with far less success in their projections and prognostications.

Since the future of this authoritarian regime is one of the major concerns of this volume and serves to distinguish it from other recent collective efforts (such as those assessed in this *Review*, 67 [September-December 1973] 1089-90 and 1421-24), it seems legitimate to ask how well the authors' predictions fit the actual developments of the past five years. They fit reasonably well up to the date of publication in late 1973 but rather poorly since then. Comparison of the constituent essays which have best and worst withstood the test of time leads me to conclude that in this instance, there is an inverse relationship between the rigidity of analytical schemes and the quality of forecasting. Thus, the greatest weaknesses of this study, as well as much of its broader interest and significance stem from a "deliberate search for new conceptual frames of reference to help put the process in Brazil in a larger comparative framework" (p. viii). As might be expected in a collaborative venture, the attempts in this respect have been uneven, with the results even more so.

The opening chapter on "Politics and Economic Policy Making in Authoritarian Brazil, 1937-71" by University of Wisconsin historian Thomas Skidmore underscores the continuities between the Estado Nôvo (1937-45) and the post-1964 period of authoritarian rule. While this essay is essential for an adequate appreciation of contemporary Brazil, it, like the rest of the book, lags behind the changing reality. The present for Skidmore is the early months of the Médici administration (October 1969 to March 1974); by now the policies of the Geisel government and particularly the elections of November 1974 must lead one to question his flat assertion that the regime has left itself no "extractive option" (p. 16). In a similar vein, the dominance of the "hard line" within the officer corps basic to his political analysis was very doubtful at the time Skidmore was writing; since then the trend has been strongly in the opposite direction. One of the keys to the durability of the regime is not an alliance of the technocrats and "hard-line" military, the feature upon which Skidmore concentrates, but rather a coalition of the tecnicos and the military moderates so clearly in command of the present government. Essentially, then, his look into the future (pp. 44-46) is flawed by the mistaken assumption that the military's hard-line rightists were entrenched in

positions from which they could determine the subsequent course of events.

While of interest for comparative perspectives, particularly in the contemporary Peruvian case, Stepan's own chapter adds nothing to his previous work on the Brazilian military and its role in politics. Indeed, this is the most dated portion of the book, with no information past 1969 and most of the analysis dealing with trends through the mid-1960s. This failure to deal with important tendencies already evident by the time of writing weakens the entire volume, since none of the other contributors has ever conducted research on the Armed Forces, the most crucial element of the Brazilian political system. The economic chapters by Albert Fishlow, Samuel Morley, and Gordon Smith are of a high quality, but need to be balanced by a reading of diverging analyses by Professor Werner Baer, such as his chapter in *Brazil in the Sixties,* edited by Riordan Roett (Nashville, Tenn.: Vanderbilt University Press, 1972). The most serious defect of these papers is a consistent failure to bring out the neo-Bismarckian character of Brazil's present political economy and concomitant overvaluation of the political influence of internationally linked industrialists and the private financial sector.

Prominent Brazilian sociologist Fernando Henrique Cardoso has contributed a highly conceptual essay on "Associated-Dependent Development: Theoretical and Practical Implications" (pp. 142-76). Containing substantial ideological and polemical elements, it should require the serious scholarly reader to seek first-hand familiarity with the works of the Brazilian authors under attack by this productive and creative contributor to the currently burgeoning literature on dependency theory. (It might be noted that Hélio Jaguaribe, Cândido Mendes, and Celso Furtado have significantly refined their analyses in more recent studies than those of the 1966-69 period upon which Cardoso focuses.)

The most provocative, yet in some ways the least persuasive paper is Philippe Schmitter's attempt to view Brazilian developments in terms of "Portugalization" (pp. 179-232). Given subsequent events in that European country, this term may by now have taken on a connotation quite different from that intended five years ago by Professor Schmitter. Departing from the premise of his earlier work that "there may be an elective affinity between certain structural and behavioral attributes of 'delayed-dependent' development and protracted authoritarian rule" (p. 184), this University of Chicago political scientist weds a Bonapartist model to a study of policy outputs and outcomes. In his own terms "deliberately speculative and evaluative," Schmitter's essay places very heavy stress upon trends of the 1964-69 period, reinforcing his argument with very selective data from 1970-71. By contrasting his picture of evolution toward a "single, no-party system" (pp. 209-11) with the vigorous comeback of the opposition party, the Brazilian Democratic Movement (MDB), in the November 1974 elections, one can recognize the dangers of this type of straight-line projection. Indeed, accepting Schmitter's basic interpretation of the present regime (pp. 228-32), one would have expected that the 1974 elections would either have been manipulated to prevent major gains by the opposition or the results set aside. Instead, there is considerable evidence that the government at its highest levels welcomed the reinvigoration of the parliamentary opposition as a step toward decompressing an authoritarian situation. Implicit in Schmitter's analysis is a belief that the 1973-74 presidential succession would accentuate factionalism within the military; since the actual effect of this process was rather one of consolidation, one must doubt others of Schmitter's imaginative speculations.

The varied writings of Juan Linz are of such consistent excellence that we have come to expect a great deal of him. In this case we are not disappointed. Although the only contributor not to have conducted research in as well as on Brazil, he does an outstanding job of putting Brazil in comparative perspective. Since he, even more explicitly and directly than Schmitter, is concerned with the future, it seems fair to assess his thoughtful interpretation in light of subsequent developments. Events have borne out this Yale political sociologist's view that nonparty legitimacy—either charismatic or corporativist—would not be tried in Brazil, nor would institutionalization involve fascist-type or socialist, populist single-party solutions. Certainly Brazil's current leaders could fully subscribe to Linz's conclusion that "it will be a very difficult task to create a broadly popular hegemonic or predominant party in Brazil" (p. 249). Yet they may note with interest his choice of *will* rather than *would* as the operative verb. Then, too, one might question the assumption that institutionalization of the political system need be achieved within a few years as long as progress toward this end is being made and congruent changes are being brought about in the society and economic realm.

Class, Race and Political Behaviour in Urban Jamaica. By Carl Stone. (Kingston, Jamaica: Institute of Social and Economic Research, University of the West Indies, 1973. Pp. 188. $3.50.)

During the last decade scholars have traced

the development of the two-party system in Jamaica, examined the involvement of race in the electoral process in Trinidad and Guyana, explored the charismatic qualities of the leader in Granada, and emphasized the impotence of colored and black political elites to effect social and economic change throughout the Commonwealth Caribbean. Professor Carl Stone's book is a useful contribution to West Indian political science. Unlike most previous researchers he has worked at the microlevel and employed questionnaire material derived from quota samples representative of the adult population of a subinsular community—in this case Kingston, the capital of Jamaica.

The political situation in Jamaica is well known in outline, but Stone clarifies some of the details. Since universal adult suffrage was introduced in 1944, politics have been dominated by the Jamaica Labour Party (JLP), created by Alexander Bustamante, and the Peoples' National Party (PNP), founded by Norman Manley. Eight general elections have been held in the last 30 years; the JLP has won five, the PNP three. The JLP was originally an offshoot of the Bustamante Industrial Trade Union. The PNP rapidly established its own union wing, first the radical Trades Union Council, and, after the expulsion of the Marxists from the party in 1952, the National Workers Union.

There is still a tendency for the JLP to be associated with big business and the lower class, and for the PNP to draw its staunchest support from the brown middle stratum in Kingston, but both parties are now essentially multiple-class coalitions, geared to collecting as many votes as possible at the general elections. Each party has a low commitment to ideology, each is led by a politician claiming messianic qualities, each supports the national ethic of multiracialism, each bestows patronage on capital and labor. The author correctly concludes that "voting preserves a facade and appearance of mass control over political life, while social and economic elites exercise preeminent influence on the day-to-day decision-making process" (p. 71).

Stone argues that "material affluence and income are the main determinants of social status in contemporary urban Jamaica, although race, education, training, and class acculturation clearly affect the economic life chances of the individual" (p. 11). He therefore subdivides his Kingston sample into occupational grades, with big businessmen at the apex of the socioeconomic scale and at the base "a somewhat loosely defined residual category of unskilled and low status labour such as casual workers, domestic servants and itinerant street vendors" (p. 12).

A sense of solidarity among Kingston's manual workers has been frustrated by the emergence of a unionized elite, which has been co-opted by the two political parties seeking to maintain the *status quo*. At the opposite pole stands the unemployed sector, which comprises more than one-fifth of the capital's labor force, and is alienated from the multiple-class coalitions. Neither political party can preserve its upper class support and at the same time satisfy the demands for material improvement voiced by the underprivileged.

The book shows that as the occupational scale is descended, alienation from the established order increases. Discontent is expressed in abstention from voting, a marked preparedness to support a third party, and willingness to resort to violence. Urban Jamaicans express polarized attitudes to race and nationalism. The majority favors the *status quo*, but the lower class demands an end to white economic domination, and rejects multiracialism in favor of black solidarity. Blacks tend to be more radical than browns in all matters that pertain to race and economy; unionized labor is more conservative than nonunionized workers when confronted with the same issues. The unemployed, however, are the most vocal supporters of black power, the Ras Tafari, black capitalism and nationalization of the bauxite industry. There is a time-series relationship between unemployment and crime, and the unemployed are involved in sporadic street riots.

The strength of this book lies in its attempt to quantify the qualitative judgements made by other social scientists who have worked in Jamaica. Moreover, the author displays considerable realism when he points to the durabiltiy of the two-party system, the capacity of the parties for regeneration, the dependence of the lower class on sporadic political patronage, the low quality of leadership which has characterized "third" parties in Jamaica. He shows that problems emerge when extrapolating from the alienated poor in Kingston to the situation in rural Jamaica, where the presence of a landholding peasantry is conducive to the *status quo*.

Methodologically the book has two weaknesses. Many of the occupational groups in the sample are very small, but statistical tests of significance are not employed to provide a rigorous basis for comparison between them. Second, Stone's dismissal of M. G. Smith's concept of social and cultural pluralism, on the grounds that interviewees complain only of material deprivation, is nothing short of cavalier. Stone's error does not invalidate his findings, but reference to the plural framework of Jamaican society would enhance his conclusions.

COLIN G. CLARKE
University of Liverpool, England

Elites against Democracy: Leadership Ideals in Bourgeois Political Thought in Germany, 1890–1933. By Walter Struve. (Princeton, N.J.: Princeton University Press, 1973. Pp. 486. $20.00, cloth; $9.75, paper.)

Struve is a social historian, who, as such, claims to be far better qualified to examine the phenomenon of elitism than are social scientists, whose work is often "a function of their attentiveness to the manipulative and policy requirements of the U.S. *imperium*" and to "the class they serve" (p. 475). Plagued by "fantasies" that power is exercised primarily by "holders of formal political offices" or by dispersed "functional elites," social scientists have become mere "cheerleaders of the American Century and analysts for the ruling class" (p. ix).

This is a collection of biographical essays in which Professor Struve argues that in response to the rise of Marxism, such "bourgeois" thinkers as Friedrich Naumann, Max Weber, Walter Rathenau, and Oswald Spengler devised elite theories which they hoped could direct the power of the masses in support of the "bourgeois social order." All advocated an "open-yet-authoritarian elite," or "democracy of personnel selection" (p. 3), which would rest on three assumptions: A few men would always rule and make all crucial decisions; other citizens could or should play little if any role in formulating decisions or in controlling the elite; finally, recruitment would not be restricted to only one segment of the society. In Struve's opinion, the goals of this democracy without "popular control" were not only to strengthen Germany, but more importantly to "establish the uncontested hegemony of the bourgeoisie" and to satisfy the demands of "monopoly capital" (p. 17). He insists that the latter goals applied regardless of whether the theorists themselves were aware that they were serving these goals; the bourgeois social origin and status of these thinkers determined their views.

In a chapter entitled "The Sources of National Socialist Elitism." Struve links these theorists, the National Socialists, and the "United States imperialists," all of whom called for elites which would "function within the parameters of bourgeois society" (p. 419). By weakening the aristocracy and the old upper class, the National Socialists destroyed the impediments to "monopoly capital" and thereby helped bring West German capitalism into the "U.S. *imperium*" (p. 459).

Certainly, few influential German writers at the time advocated "popular control," although Struve's failure to describe how such control should be exercised makes it difficult to determine how elitist a thinker really is by comparison. Also, although he excessively minimizes its relative significance, Struve is correct in noting that many Germans argued for a non-Marxist social order with the firm support of all Germans in order to strengthen German foreign policy claims. This is, however, hardly an original insight, as the works of Fritz Fischer, Gerhard Ritter, Karl Dietrich Erdmann, and others reveal.

The book's strengths are outweighed by its weaknesses. The terminology which Struve uses is extremely imprecise. Such terms as "big bourgeoisie," "haute bourgeoisie," "middle class," "monopoly capital," "left liberals," "right wingers," etc. are used with little or no effort to define them or to distinguish them from one another. Perhaps the major problem is that Struve borrows uncritically the language of such writers as Jürgen Kuczynski, whose writings endure allegedly because they are based securely in "the fertile bed of Marxism" (p. 468). A second major weakness is Struve's unsubstantiated argument that earlier German elite theories describe contemporary United States, Britain and France "better than the dogmas of political democracy" (p. ix). Because Struve fails to provide parallels and examples, his assertion remains unconvincing.

Finally, Struve's persistent attempts to assert economic causation in political thought remain highly unpersuasive not only because he provides such meager evidence, but because he admits to having "slighted the economic nexus of social history and the impact of the development of the institutions of monopoly capitalism upon bourgeois political and intellectual culture" (p. 20). His argument of the importance of social origin and status is slightly more credible, although he by no means succeeds in showing that such factors determine political ideas. For example, he asserts that the social origins and status of Leonard Nelson and most of his followers "impeded their efforts to comprehend Marxism" (p. 208). Struve ignores the fact that Nelson, his students, and Marx himself were intellectuals with almost identical social origins.

Political scientists who are seeking biographical information will perhaps find this book of limited use although earlier biographies by Heuss, Mommsen, Kessler, and others are more highly recommended. Those who want a more precise understanding of elites and elite thinking may safely leave this book on the shelf.

WAYNE C. THOMPSON

The International Labor Movement in Transition: Essays on Africa, Asia, Europe and South America. Edited by Adolf Sturmthal and James G. Scoville. (Urbana: Univ. of Illinois Press, 1973. Pp. 294. $12.50.)

For a number of years, Adolf Sturmthal, one of the deans of comparative trade-union studies, has been exploring the related questions of:

> [First] What were the conditions which caused some labor movements in some periods to emphasize political rather than economic objectives and means of action? And second, what were the circumstances that led to the development and vast expansion of the collective bargaining system in the United States and Great Britain.

Related to these questions, and one of the central subjects explored in this volume, is the likelihood that other countries in the world would replicate the U.S.-British experience, with the expansion of collective bargaining.

Sturmthal himself has set forth a general theory of union development, in terms of market conditions. He holds that at the stage in development when labor is in excess supply, one can expect unions to stress political action. The obverse is that when labor is in short supply, i.e. when the modern sector grows, birth rates decline, etc., unionism will take on more of an economic, a collective-bargaining emphasis. All of the foregoing are conditioned, however, by a particular country's social and political history. Ideology, in the case of labor movements, can also continue as a kind of independent variable, for a long period after economic conditions have changed.

Thus, one finds certain "constants," as Sellier's chapter in the volume records for France, where the statist-dirigiste tradition tends to force unions and management back toward a dependence on government action, even in periods which seem opportune for autonomous collective bargaining. Or a tradition of enterprise dependence, apparently deeply imbedded in Japan, which persists even when labor market conditions seem to favor the emergence of unionism and bargaining, more in the American (or British) style.

Sturmthal and his co-editor, Scoville, have collected a series of contributions on union development in a variety of countries to test their general theses. The result is a useful volume though as is almost inevitable in such cases, the contributions are uneven, and a few of them appear to be wide of the mark of testing the editors' general theses.

Jan Pen, for example, contributes a chapter on Dutch union attitudes toward central wage policy, which is interesting enough, but doesn't shed much light on the editors' central theses about union development. One of the factors (among a number) which Pen says makes it increasingly difficult today to bring about union acceptance of any central wage policy is the rise of "affluence" and with it a new-left socialist critique. That critique attacks every accommodation with the "establishment," as well as the unions' failure to pay sufficient heed to nonmaterial factors such as environment.

In such a setting it becomes difficult for the Dutch unions (especially the socialist-oriented NVV) to cooperate with any government (read establishment) plans for a central wage policy. This conclusion is interesting in itself, but a bit difficult to assimilate into the Sturmthal-Scoville overriding general schema of union development.

The chapter on German union evolution by Peter Lösche comes closer to testing some of the Sturmthal-Scoville theses. Lösche concludes that the early, enduring ideological commitment of German unions to revolutionary political (and social) reform explains the labor movement's general philosophy and political program, since the end of World War II. On the other hand, labor market conditions and great shortages since the German economic miracle got under way, help explain the increasing practical emphasis on bargaining in the past decade or so.

The chapter on "The Economic Power of Argentine Manufacturing Labor Unions" by Carlos E. Sanchez and Aldo A. Arnauldo bears out the relationship between political and economic unionism, though in a somewhat special manner. The political support of unions by the Peron government helped build the modern Argentine labor movement in the 1940s, but this movement went into decline with Peron's overthrow in 1955. New political support, and the passage of favorable legislation in 1958 strengthened the unions, and they translated this strength into new bargaining efforts. The authors demonstrate the striking bargaining gains thereupon achieved for union members in a number of industries. This appears to be a case where political power is translated into economic bargaining power, without clear evidence that labor market conditions changed substantially.

Peter Kilby in his chapter on unionism in Nigeria sees little likelihood in "Sturmthal's prediction, that voluntary collective bargaining, will, in fact, emerge at the labor-scarce stage." He finds that Nigerian unionism, structured along Anglo-Saxon lines fails "to serve any 'essential' need and thus elicits no sustained loyalty from either its leaders or its members." Rather, he goes on to say, unions are a "channel for the protest of relatively privileged wage earners against the distribution of the national wealth

between themselves and those at the apex of the distribution pyramid. . . ." (p. 258). Kilby concludes that the politicized Anglo-Saxon model [Nigeria] has resulted in a worse rather than an improved state of industrial relations, as compared to "the pre-existing non-unionized situation" (p. 258). Kilby generalizes his findings about the undesirable results and prospects of Nigerian unionism to other "underdeveloped countries."

Aside from those already referred to, there is a chapter by Bert Hoselitz on labor markets and two on Japan, one by H. Kawada and R. Komatsu and the other by Koji Taira.

While the volume does not always meet the editors' objective of testing their theses about union development, it is stimulating and useful. At the least, it should convince most readers that conventional Anglo-Saxon models are not likely to offer very much help in understanding union development in most of today's world. On the other hand, I find that *elements* of this "model" offer partial insights into union behavior in many unlikely areas. Complaints about "economism" by Communist Party officials against mainland Chinese unions, the emergence of a craft-union bargaining mentality in parts of Asia, these as well as some pieces of this very volume under review attest to the continued usefulness of the bargaining model as *one* (though by no means the only one) angle of vision into aspects of union activity and philosophy. Like all other general theories of unionism, including those of Sturmthal and Scoville, however, the Anglo-Saxon model does indeed have important limitations.

E. M. KASSALOW
University of Wisconsin, Madison

Native Fascism in the Successor States, 1918–1945. Edited by Peter F. Sugar. (Santa Barbara, Calif.: American Bibliographical Center —Clio Press, 1971. Pp. 166. $4.50, paper.)

The twelve short historical studies published here were originally presented as papers to a conference on this theme organized by the University of Washington in 1966. Three features of the collection make it a useful addition to the growing literature on European fascism: the juxtaposition of a "native" and an American interpretation of developments in each country; the inclusion of Czechoslovakia and Yugoslavia (generally omitted from similar symposia); and the exclusive focus on native Central and East European fascism. The value of these features would have been enhanced by a clearer division of labor between the contributions on each country, by greater consistency of documentation, and, most important, by a definition of the basic term of reference, fascism. The editor's statement that it was "simply taken for granted" and that all contributors show a "basic common understanding of which movements were truly fascistic" (p. 148) is less than useful in the light of the variety of definitions used by the contributors.

What all the contributors do agree is that the regimes which stayed in power in these countries between the wars were something other than fascist (Pilsudski's Poland is compared to France under de Gaulle [p. 86]), but the description of Horthy's regime as walking a tight-rope between "aristocratic parliamentarianism and fascistic authoritarianism" (p. 70) raises the fundamental problem of definition which becomes increasingly important in any analysis of the "authoritarian" regimes as they move toward fascism without actually reaching it.

In view of the general use of the German and Italian varieties as yardsticks and in view of the basic economic, social and cultural differences between their settings and those of Eastern Europe, it is not surprising that native fascism in the successor states has exhibited some distinctive characteristics. The differences among the six countries often appear greater than the similarities, though some interesting common features do emerge. Professor Fellner stresses the strong religious, particularly Catholic, element, and certainly this was important in the political life of Austria, Slovakia and Romania, but nationalism in its various forms seems a far more important condition for, and determinant of, fascism in East Europe.

Some interesting and fairly distinctive East European patterns of social support for fascism can be extrapolated from the studies. The mass peasant base one might have expected did not materialize. As for the workers, the Hungarian Arrow Cross was exceptional in attracting some of the non-unionized to its ranks; the overwhelming majority of the relatively small proletariats were socialist or Communist. Students played an active role, and Professor Ranki offers some evidence to show that officers and ex-officers adhered in greater numbers than their West European counterparts, but all this fell short of the support necessary to gain political power. The editor's observation that the fascists were merely biding their time until the authoritarian regimes degenerated into fascism is unpersuasive, particularly as it is not borne out by his contributors. All the studies emphasize the political weakness and peripheral nature of native fascism until events in the international arena jolted it into prominence.

The quality of the contributions in this collection is uneven. Some are valuable: Professor Havranek's *Fascism in Czechoslovakia* explores

relatively unfamiliar ground, while Professor Fellner's *The Background of Austrian Fascism*, Professor Barany's *The Roots of Hungarian Fascism* and Professor Wandycz's *Fascism in Poland 1918-39* all provide useful appraisals of well-known material. As a whole, however, the collection does not add significantly to our understanding of this important phenomenon. This is in part due to the lack of a clear comparative framework for which the editor's suggestive conclusion does not really compensate. A systematic, comparative cross-national study of native fascism in this area might concentrate and shed more light on the relationship between this phenomenon and key variables such as political culture, economic conditions, social structure and political organization. In this way the mining of the "mountain of problems presented by the study of these fascist movements" could proceed beyond "surface scratching" (p. 156).

ALEX PRAVDA
University of Reading, England

Indonesia After Sukarno. By J. M. van der Kroef. (Vancouver: University of British Columbia Press, 1971. Pp. 253. $6.00.)

This volume from the prolific pen of Professor van der Kroef considers the political and economic condition of Indonesia from the outset of the abortive coup of October 1965 until the holding of the country's second general elections in July 1971. The period in question is demarcated by two episodes which indicate political change of great significance, namely, the fall of Sukarno and the electoral validation of the succeeding order of Suharto. Professor van der Kroef deals methodically with these episodes and other related issues of the period. His point of entry is the abortive coup itself, arguing on the question of initiative that "it now seems likely that P.K.I. leaders, alarmed in August 1965 over reports of Sukarno's rapidly declining health, allied themselves with a number of dissident Army officers, some of them in the Central Java-based Diponegoro division, others in the East Java-based Brawidjaja division" (p. 6). Van der Kroef is prepared to distinguish, however, between the P.K.I. per se and a coup group within it, and claims:

> It seems equally evident, however, that the statements of Sudisman and other Indonesian Communists that the P.K.I. as such was not involved in the coup, have some substance of truth also, although wittingly or not many party and front members were obviously engaged in preparations for it. Available evidence thus far strongly suggests that, either because of caution or because of poor coordination, only a few politburo members and party provincial and district leaders appear to have been aware that a coup was being planned (pp. 9-10).

Concerning a related aspect of the abortive coup Professor van der Kroef asserts, though without convincing evidence, that "The Government of People's China from the start was aware of and materially assisted the *Gestapu* conspirators" (p. 6).

After this diagnosis of origins, the author considers the immediate consequences of the abortive coup, including the bloodbath of the implicated and the innocent. In discussing the actual toppling of Sukarno, he makes the cogent observation that Sukarno's political fall was not inevitable but was a consequence in part of his insistence on trying to protect the pivotal role of the radical left and also of his refusal to concede any sense of accountability as president. Of further interest is a consideration of the role and position of the political parties during the post-coup period of manoeuvre when the military leadership of the recently instituted New Order was determined to circumscribe their activities. In assessing the process of constitutional change, which was not completed until after the end of the period in question, the author investigates some of the less appealing features of Suharto's New Order and remarks that "the treatment of the political prisoners and the obvious inability of Indonesia's judical system to cope with them and with the problem of civil and human rights which they pose, had already by the end of 1968 become perhaps the worst unrelieved scandal of the Suharto regime" (p. 72).

Other matters that are considered in some depth and in an informed manner are the prospects for Communist revival (in which a healthy skepticism about some governmental claims is displayed) the so-called "act of free choice" in West Irian, the problems of economic rehabilitation, and the changing character of foreign policy. In the chapter on foreign policy, attention is devoted to the break with China and the extent to which the formal reinstatement of the "independent and active" formula does correspond with actual state practice. In addition, the author addresses himself to Indonesia's support for ASEAN seen as the basis for a new security arrangement for Southeast Asia outside of a formal security pact. The concluding chapter discusses the preliminaries to the elections of 1971 and highlights the emergence of *Golkar* and the role of the Army in managing a political enterprise designed to root the New Order in constitutional legality; actual results are given without a detailed breakdown.

The general tone of this volume, exemplified in some of the author's concluding comments, indicates a skepticism about the stability and enduring quality of what is described as a semi-military regime. Professor van der Kroef puts forward the thesis that such a regime will become "unsupportable" if it fails to provide tangible

economic benefits. To the extent that this regime has not succeeded in transforming the deep-rooted constituencies of Indonesian politics, such an argument is valid if less than conclusive on its own. As a general survey of its time, this book contains a substantial amount of detailed information and on balance makes a successful attempt to interpret a complex series of events.

MICHAEL LEIFER
The London School of Economics and Political Science

The Blacks in Canada: A History. By Robin Winks. (New Haven, Conn.: Yale University Press, 1971. Pp. 546. $15.00.)

Beginning with the first black in New France about whom there is information, young Olivier Le Jeune, Professor Robin Winks proceeds with meticulous detail and lucid exposition to give us an example of history writing at its best. The result is a definitive history of blacks in Canada which will stand as a benchmark for further research, whether historical or not. Sociologists and political scientists will remain indebted to Winks for giving us, in such easily accessible form, the materials from which to build further and more contemporary analyses, for example, on the development of civil rights in Canada or the extent of ethnic differentiation within the black community.

The black experience in Canada, as Winks documents, has not been a happy one. One may wonder if it could have been otherwise. Blacks first came as transported slaves, and if slavery was not always devastating in its effects, particularly for the relatively few in New France and household slaves generally, it was still the most deplorable of human conditions. Blacks were often caught up in social movements originating elsewhere that concerned their fate—most obviously abolition, but also 'back to Africa' schemes, Booker T. Washington's self-help movement, the heartbreaking efforts at settling utopian communities, and other similar developments. In all of these, whites were largely indifferent, occasionally involved on the side of blacks, and often sanctimonious in assessing the benefits of life in Canada. In one area, Nova Scotia, racism was strong almost from the outset, and the combination of poverty and discrimination continue almost till today to make miserable the lives of black residents.

Given the thoroughness of Winks's historical research, and the fairness with which he assesses the handicaps confronting blacks in Canada, it is perhaps surprising how unsympathetically Winks treats those leaders, both black and white, who have attempted to better the condition of blacks. As a sociologist, I suspect that this lack of sympathy is due to the historian's inclination to place inordinate emphasis on the significance of leadership. For one thing, while it is true that some leaders were charlatans and easily seduced away from the goals of helping blacks, others were magnificent, even in their blind convictions that what they were doing was right, when all evidence was to the contrary. Here I think of such people as John Clarkson, a white Englishman, who led a group from Nova Scotia to Sierra Leone, under the most incredible hardships. Another is Josiah Henson, thought to be the model of Harriet Beecher Stowe's Uncle Tom. But more important, I believe, were the devastating consequences of slavery, that made any leader's task almost impossible. While there seems to be some inclination now to speak of the benign aspects of slavery, basically I feel this is absurd, and Winks himself makes no such claims. What he seems not to fully appreciate, though he does document it, is the way slavery, particularly plantation slavery, overwhelmingly destroyed those social and psychological mechanisms for dealing with the future beyond mere survival. When former slaves were faced with the poorest of land, as in Nova Scotia, with the general difficulty of establishing communal settlements by any less than angels, as in Upper Canada (now Ontario) and with instances of white hostility—then their successes, no matter how limited, need to be viewed more sympathetically.

Winks comes through as an activist, eager for blacks to take the initiative in changing their status, and critical of whites who do not help them. This is most evident when he deals with four mechanisms of self-help. His activist stance leads him to view black churches as appropriate to a stockade mentality, but generally not helpful in breaking down barriers. Yet his meticulous research may allow others to make different judgments, as they consider clerics and leaders of the old school like White and Oliver in Nova Scotia. With respect to education, he tells us horror stories that Canadians are inclined to wish did not exist. For example, up until 1936, blacks in the village of Birchtown, Nova Scotia, did not receive any schooling, and that in an area where blacks had been present since 1787. The last segregated school in Ontario did not close its doors until 1965. With the black press, Winks can tell what is to him a more satisfying story—it has often been bold and forthright in the defense of black interests. At the same time, the black press suffers not only from overwhelming competition from the United States, but also from the general circulation press in Canada. Finally, he asserts, the organization of blacks into associations for the protection and promotion of their

interests remains more a task for the future than a mature effort.

This last statement leads me to conclude that Winks has written not only a definitive history of blacks in Canada, but also, and inevitably, a comment on the history of Canada. Blacks today remain a fragmented community to some degree because Canada is a fragmented society. If blacks did not face as dreadful conditions in Canada as they did in the United States, this is a reflection of the slower, more civil pace of life in Canada, and the greater emphasis on control of overt aggression. It was reflected in the proud heritage of British justice, which made judges the principal heroes of abolition, virtually ending slavery in the 1820s, though it was not legally abolished until 1834. At the same time, these styles of life contributed to a slowness in improving conditions for blacks, compounded of a reluctance to alter the status quo and a moralistic sense of superiority to those in the United States, which prevented acknowledging the existence of problems.

MILDRED A. SCHWARTZ
University of Illinois at Chicago Circle

The Afro-Asian Movement: Ideology and Foreign Policy of the Third World. By David Kimche. (Jerusalem: Israel Universities Press and New York: Halsted Press, 1973. Pp. vii, 296. $16.75.)

The promise of the short title, "The Afro-Asian Movement," is, within a clearly definable range, most usefully fulfilled; and only a publisher would expect a study of this length to deal fully with "ideology and foreign policy of the third world"—perhaps "some aspects of . . ." and "*in* the third world" would have been more disarming—and accurate.

For Dr. David Kimche's study, based on a Ph.D. thesis and written while he was a visiting Research Associate of the Shiloah Center of Tel Aviv University, is primarily a history of the several continuities of events which have constituted the Afro-Asian Movement. This descriptive chronology, with its accounts of conferences, preliminary meetings, follow-ups and consequences, is narrative in style and contains commentaries with shrewd insights obtained from a study of the relevant conference papers and documents, contemporary press and radio files, a wide range of secondary sources, and interviews with key participants. Consistent with the purposes of the Shiloah Center, this is a study "where Israeli scholarship is in a position to make a special contribution."

Following a survey of pre-1945 Afro-Asian activities adequate for the purposes of his study, Dr. Kimche devotes roughly a third of the book to a critical description of the "governmental" Afro-Asian sequence—the road to Bandung, the two conferences of the nonaligned nations in Belgrade and Cairo, and the "demise of Afro-Asianism" at the abortive Algiers conference of June, 1965. Dr. Kimche then moves back to 1954 and picks up the sequence of the Afro-Asian People's Solidarity Organization, following it through its many manifestations as the pressures which negated Bandung—the Sino-Russian disputes, and Sino-Indian border conflict, the divergence of purposes within the region—destroy the coherence of the movement even as it climaxes in the Havana Solidarity Conference of 1966.

To this narrative Dr. Kimche adds three "case studies" dealing with India, Indonesia, and Africa. These are useful in anchoring the flights of Afro-Asianism to the realities of national politics, but the choice of topics also reveals the imbalance of the study. It is heavily influenced by informants whose information, usually anonymous, is not possible to assess. The space devoted to India and the understanding Dr. Kimche shows of Soviet policies is not balanced by his handling of China; his intimate accounts of selected African policies are not balanced with Southeast Asian studies—the Indonesian case study is not complete.

Readers must unfortunately be warned that the index is totally inadequate and that footnoting is inconsistent.

Dr. Kimche's main contributions are (i) his exposition of differentiated streams of Afro-Asian activity, (ii) his account of the Bandung Conference, placing it clearly in context so that the actualities and the "myth" of Bandung can be distinguished and the impact of the latter assessed, and (iii) his explanation of the positive factors which have moved a new generation of leaders from heady dreams of international politics to the creation of functional organizations more nearly designed to solve specific problems—from "solidarity" to the Southeast Asian Council of Ministers of Education, for example.

This is not to belittle the contribution the author has made in his analysis of Afro-Asianism: changing leadership turning to internal problems whose solutions are not furthered by ideological disputes centered on the legitimacy of Maoism, tensions within the Afro-Asian movement, and the changing relationships of Afro-Asian countries with the major powers. All of this is, in its essentials, convincingly argued.

How important to Dr. Kimche's total contribution is then his failure to deal with China in China's terms? He makes no relevant reference, for example, to either Chairman Mao Tse-tung

or to Mao's thought; the only reference to China's position regarding great power hegemony (p. 245) is expressed in racist terms based on the author's conversation with Oscar Kambona and others—despite his listing of the *Peking Review* in the bibliography. Chou En-lai appears enigmatically, surprises his audiences, and disappears once more behind the bamboo curtain, forever inscrutable.

This approach may not in fact be a deficiency. Dr. Kimche's China is China as seen by Nehru—is the China of all those with whom the study deals. That this was so—and indeed may still be so in many cases—is a fact of great significance. Bafflement with China led to boredom with China's arguments; African leaders and others had more important problems. China's impact was tremendous, but to understand this one should, perhaps, not understand China.

There are other problems. The reader will, for example, have to bring considerable knowledge to bear if he wishes to follow all the author's comments on esoteric local or regional political problems. Opposition to Malaysian participation is stated, but Indonesian inspired Maphilindo and "confrontation" is not mentioned. Only a specialist in Nigerian politics will presumably recognize the initials NCNC, while others will puzzle over North Kalimantan. Nor is Burma's seclusion noted or the work of the Colombo Plan mentioned; the declaration of the Colombo Powers is referred to but the important contents are not provided.

But these comments serve only to stress the nature of Dr. Kimche's undoubted contribution which lies in the clear, expository sweep he has given to the chronology of the Afro-Asian movement and to the perceptive comments he has provided in explanation.

Psychological Dimensions of U.S.-Japanese Relations. By Hiroshi Kitamura. (Cambridge, Mass.: The Center for International Affairs, Harvard University, 1971. Pp. 46. $1.75, paper.)

A series of events which had occurred from the summer of 1971 to the fall of 1972—starting with President Nixon's announcement of his plan to visit Red China and ending with Japan's restoration of diplomatic relations with Red China—opened a new era in the relationship between Japan and the United States.

In his short but excellent essay written just a few months before these developments began, Mr. Kitamura, a Japanese career diplomat, predicted that these "changes in the relationship will inevitably require both countries to make the following psychological adjustments: (1) to try to resolve psychological distortions concerning the other which have long existed in both countries; (2) to try to adjust traditional psychological attitudes to changes in the U.S.-Japanese relationship so that both countries can accommodate to the new situations which surround them" (p. 8). If we fail to take initiatives in these adjustments, he warns, "we are likely to find ourselves in a stalemate as serious in its own way as that of the 1930s" (p. 8). The author points out three sources of psychological problems: (1) an unbalanced relationship, (2) cultural differences, and (3) racial differences, which respectively constitute the titles of the chapters in the main part of this book.

The psychological problems of the Japanese arise more from an unbalanced relationship. They become unique, he emphasizes, when "certain psychological traits of the Japanese character have become intertwined with the relationship of unevenness" (p. 10). Three elements of the Japanese character: sense of hierarchy, "*amae*" psychology, and attention gap and their psychological derivatives are explained in detail. "*Amae*," a "Japanese word which has no English equivalent, means to depend and presume upon other's benevolence" (p. 12).

The psychological problems of Americans, on the other hand, arise more from cultural dissimilarities than from other sources. Many Americans are so confident and zealous in their search for moral good and material wealth that they regard their faith and values as the best and those of different cultures as inferior. These aspects of the American national character affect the cultural dissimilarity and transform it into a source of psychological problems.

In the concluding chapter, the author suggests how "the two countries could make psychological adjustments in order to avoid a harmful escalation of conflicts caused by the interaction of psychological factors" (p. 35). The most important and effective psychological adjustment is to realize the vital role that psychological factors have played in Japanese-American relations. The ultimate resolution of the psychological problems then requires eliminating the sources Kitamura has enumerated. He offers his prescriptions for both the American and Japanese sides. Although written five years ago, this retains its validity. As Professor Edwin O. Reischauer aptly puts it in his introduction to this book, "It is perhaps just as well that Mr. Kitamura was unaware of impeding developments, for otherwise his attention might have been drawn to these concrete issues and away from the more

important underlying problem of mutual understanding between Americans and Japanese."

The Virgin Islands: A Caribbean Lilliput. By Gordon K. Lewis. (Evanston, Ill.: Northwestern University Press, 1972. Pp. 382. $12.00.)

The U.S. Virgin Islands are a small group in the northeastern Caribbean with a total area about one-ninth that of Rhode Island and a population not large enough to fill the Los Angeles Coliseum. Before reading this excellent book, one might make this observation in complete innocence. Afterwards, one is aware, at least, of the insensitivity of it. Just as when we were children we heard of Lilliput as a funny little place with funny little people, so when we became adults we learned that it was really a mirror of ourselves.

Professor Lewis tells us everything we always wanted to know about the Virgin Islands, raising disturbing questions along the way. It is not an exercise in fault-finding or in placing the blame, but rather a thoughtful analysis of an extremely complex situation. The Virgin Islands are a microcosm of most problems facing most societies, with the added complications of political status and economic dependency. The United States purchased the islands from Denmark in 1917 for military reasons, without giving much thought to the people who were included in the sale. During the U.S. Navy's administration, the islands were looked upon as little more than "a war vessel or fleet at anchor" (p. 55). Civilian rule since 1931 has not been much better. "The territory . . . is altogether at the mercy of Congress," Professor Lewis writes after a lengthy discussion about the "glacial pace," indifference, and arrogance of the U.S. Congress. "The same is true of the various federal agencies that control and supervise so much of the territorial activities. Everything that the territory gets is given as a favor, not as a matter of right" (p. 350). He points out, however, that in many areas where the islanders exercise jurisdiction, they, too, are often unjust. Their wretched treatment of the West Indian aliens provides evidence of this.

Woven skilfully into the larger issues is a veritable textbook about the Virgins: history, government, politics, the economy, and society. Of obvious value to the scholar and student, it would also be useful to the tourist, who might read it instead of the "fun-in-the-sun" brochures. Professor Lewis compiles an insider's list of hotels, restaurants, and shops, while discussing seriously the nature and impact of tourism, the "mainstay" of the islands' present prosperity. A nice, easy style combined with substance is the hallmark of this book.

The issue of race is as pervasive as that of colonialism, and Professor Lewis seems to understand it well. "It is almost official dogma in the islands that color, as a problem, does not exist. . . . It would be more true to say that there is a color problem but that it is not couched in the harsh, polarizing terms of the North American white-black confrontation" (p. 248). He affirms, however, that the "Americanization" of the islands has introduced certain racist attitudes of the mainland variety. Because race cuts across all class, caste, and social lines in the Virgins, it has not been a cohesive force so far, but Professor Lewis perceives a number of signals for the growth of "black power" sentiment. Still, in writing about the governorship of Ralph Paiewonsky during the 1960s, he notes that "the Virgins were the only place in the United States where it was possible to witness the spectacle of a Jewish governor ruling in alliance with a black legislature, with a handful of white continentals seeking to penetrate the inner corridors of power" (pp. 326-327).

This pluralism is compounded by the "American connection." Status is not yet a political issue, and Professor Lewis asserts that the Virgin Islanders have a "dependency complex" stronger than that of any Caribbean people. Nonetheless, viewing the situation in the context of Caribbean affairs, he is bold to suggest that the Virgin Islands may sooner or later seek to be independent.

This is an outstanding book. One may disagree with Professor Lewis's analysis based upon one's reason or prejudice, but no one can dispute his humanity, his clarity, and his scholarly treatment of the subject.

The Brazilian-American Alliance, 1937-1945. By Frank D. McCann, Jr. (Princeton, N.J.: Princeton University Press, 1973. Pp. xiv, 527. $18.50.)

U.S.-Brazilian relations constitute an unusually significant chapter in the history of U.S. policy toward developing countries. Until the second World War, Britain continued to be Brazil's largest foreign investor, although trade was already shifting toward North America. By 1945 U.S. influence had become predominant. Obviously the war must have been an important factor.

Frank McCann has now told the story of how the strategic demands of war brought the governments of Franklin Roosevelt and Getúlio Vargas

into an alliance which insured "hegemony over Brazil's economic and military sectors" for the U.S. (p. 454). The U.S. badly needed Brazilian raw materials and military bases on Brazil's northeastern coast. In return for meeting those needs, Brazil extracted financial and technical help for its own mobilization effort.

The raw materials (especially quartz) and bases served their purpose. Brazil's northeastern bulge became the "trampoline to victory" in the Battle of the Atlantic and the North African campaign. The Brazilians were proud to have played a wartime role that included sending an expeditionary army division which fought (after agonizing delays in their proper training and equipping) under the command of the U.S. Fifth Army in Italy.

This wartime alliance was built to outlast the war. U.S. policy-makers wanted to maximize the future trade potential with Brazil. They also wanted to make the U.S. the exclusive foreign supplier of military equipment and training. As postwar history has shown, both goals were achieved. In the process the U.S. made a commitment to aid basic Brazilian economic development, including industrialization. As early as 1940 the U.S. pledged a $30 million loan to build Brazil's first steel mill at Volta Redonda. As McCann notes, this was a forerunner of the ambitious aid programs directed at the Third World in the 1950s and 1960s. Anyone interested in the rationale and context of such programs can learn much from McCann's careful analysis of government thinking. Vargas bargained shrewdly, trying to play off U.S. and German offers. But the coming of the war clouded the German option. Brazil accepted the American bid and headed into an ever deeper dependence on the U.S. Neither German trade, nor British investment, nor French military missions were ever again to threaten U.S. hegemony in Latin America's largest country.

McCann's impressively researched monograph offers richly informative detail on the leading Brazil actors: Oswaldo Aranha, the expansive Ambassador to Washington and later Foreign Minister; Getúlio Vargas, whose enigmatic political style kept his enemies off balance; Dutra and Góes Monteiro, the opportunistic generals who finally shifted from a pro-German to a pro-Allied stand. On the U.S. side, the feud between Sumner Welles and Cordell Hull is once again documented. This time we see how, before his ouster, Welles had effectively helped make growing U.S. hegemony palatable to the Brazilians. He was greatly aided by Jefferson Caffrey, the U.S. Ambassador in Rio, who had developed an extraordinary rapport with the Brazilians.

The author gained access to numerous public and private archives in both the U.S. and Brazil, including U.S. military records. As a result his excellent documentation relies almost entirely on primary sources. Specialists will want to compare McCann's interpretation with the relevant chapters in Moniz Bandeira, *Presença dos Estados Unidos no Brasil* (Rio de Janeiro, 1973), although it should be noted that Bandeira did not consult U.S. archives. McCann's fluent style further enhances a book which will be essential reading for anyone interested in the origins of postwar U.S. economic and military policies toward the developing world.

University of Wisconsin, Madison

Conflicts and Conspiracies: Brazil and Portugal, 1750-1808. By Kenneth R. Maxwell. (New York: Cambridge University Press, 1973. Pp. 289. $14.95.)

Brazil becomes the center of attention for eighteenth-century European diplomats and merchants in Kenneth Maxwell's fascinating and important study, *Conflicts and Conspiracies: Brazil and Portugal 1750-1808*. Based upon extensive archival research in Brazil, Portugal, and Great Britain, Maxwell's complex yet readable account tells how Portugal fashioned a colonial policy in Brazil to keep British merchants out without antagonizing Portugal's position inside Britain's informal empire. Unfortunately for Portugal, this colonial policy led to abortive movements for independence in Brazil, and eventually led to closer and more direct relations between Britain and Brazil.

As Professor Maxwell tells the story, Portugal joined Britain's informal empire in 1703 through the Treaty of Methuen which opened British markets to port wine, and Portuguese markets to British textiles. As British goods flooded the Portuguese market, British factors eventually controlled most of Portugal's export trade and provided credit for Portuguese colonists in Brazil. What made this all possible was the discovery of gold and diamonds in Brazil, and Portugal's easy wealth encouraged her to continue buying British goods rather than spurring industrial development. The death of João V in 1750 and the accession of José I and his minister, the Marquis of Pombal, offered Portugal the opportunity to control the future infiltration of British merchants without breaking the Anglo-Portuguese alliance. Pombal, Portugal's virtual ruler from 1750 to 1777, initiated a new colonial policy which was supposed to raise mining taxes, protect Portuguese merchants and producers of sugar and tobacco from British creditors, and use the anticipated increased revenues to finance Portuguese industrialization.

The effects of Pombaline reforms in Brazil proved to be quite different from original expectations. Pombal invented a colonial policy innocuous enough not to antagonize the British government, but almost lost Brazil to revolts. Anticipated changes in gold-mining taxes led in 1789 to a major conspiracy in the gold fields of Minas Gerais. Removal of price controls in 1781 apparently sparked a revolt in Bahia in 1798. Both conspiracies failed, and the possibility of losing Brazil led to reforms in Brazilian colonial policy. Even though British traders had been closed out of newly revived Brazilian industries, Britain watched Brazil's growth with great interest. As Maxwell aptly points out, Brazil had become more important to Great Britain than Portugal was. Thus it came as no surprise to knowledgeable observers when the British encouraged the Portuguese court to abandon Portugal to the advancing Napoleonic forces in 1808 and to move to Brazil, Portugal's most important asset. Finally, after 1808 Britain eventually replaced Portugal as Brazil's major trading partner.

Maxwell's analysis of interrelationships among Brazil, Portugal, and Great Britain is a major addition to the existing literature on international relations in the eighteenth century. His organization and conclusions about British influence in Brazilian revolts, however, tend to weaken the thesis. Despite efforts to connect the Minas conspiracy with British-linked merchants in Rio, there appears to be little direct relation between the Brazilian uprisings and private or public British policy. Even Maxwell admits that natural factors and human factors transformed Pombaline reforms into an inflexible body of regulations. Inflexibility then led to conspiracy. Thus the accounts of the two conspiracies become isolated segments unrelated to general questions of Anglo-Portuguese relations. Despite these shortcomings, *Conflicts and Conspiracies* is an impressive work which should become required reading for anyone interested in the interaction of these three countries.

DONNA GUY

Social Hierarchies: 1450 to the Present. By Roland Mousnier. Translated from the French by Peter Evans. Edited by Margaret Clarke. (New York: Schocken, 1973. Pp. 206. $9.00.)

Professor of History at the Sorbonne, Mousnier has arrived at a wide-eyed discovery of functional theory that will not impress American social scientists because it virtually ignores the enormous stratification literature of the last 30 years. Before criticizing the book, I shall summarize the argument in sufficient detail to do justice to the oddness of its propositions.

Stratification systems reward individuals to ensure that they carry out necessary societal functions (p. 11). Each function is evaluated by general opinion about the knowledge needed to carry it out and the degree of responsibility involved (p. 14). A person's main function corresponds to his job (p. 15), but other stratification criteria such as race, birth, religious purity, property, community activities, and personal qualities are grouped together to determine a person's rank. To understand the system of a given society, scholars should examine correlations among these scales; many sociologists, such as Aristotle, Plato, and Voltaire, mistakenly focused only on economic factors.

The main types of stratification are estate, caste, and class. The most important is the estate (or order) type, because societies organized on this principle are most numerous (p. 49) and most likely to prevail in the future (p. 189). Based on social esteem, rank is established by consensus on the importance of a function. Such consensus is the basic organizing principle of society (p. 49). Estate societies develop in two phases. The first is based on a religious intensity of feeling (p. 51), and the highest positions are filled by those with the most ardent faith. Social rank derives from the prestige attached to the strength of a person's feelings (p. 61). This phase is democratic because anyone, regardless of birth, can reach a level of intense feeling, act upon it, and thereby attain the highest rank (p. 62). In the second phase, the hierarchy is structured not by degree of faith but by adherence to the substance of faith (p. 64).

The rest of the book describes the order principle that organized various societies, about ten pages to each: military in seventeenth-century France; administrative in Mandarin China; theocratic in Rome and Tibet; liturgical in seventeenth-century Moscow; ideological in Revolutionary France, Fascist Italy, Nazi Germany, the Soviet Union; and technocratic, increasingly dominant in the twentieth century.

The book's argument is flawed in three ways. First, despite lip service to sociological complexity, the author rejects vulgar Marxism only to accept vulgar functionalism. Class society theorists, Mousnier incorrectly believes, hold that wealth determines prestige and power. Rejecting this view as simplistic, Mousnier accepts its converse: prestige determines power and wealth. The simple monism of his causal chain thus ignores the complex interplay of sociological variables. His further proposition that "men in general" concur on the importance of social functions implicitly assumes that what is good for society is so self-evident that all men (women are invisible in the entire book) will concur.

Second, Mousnier never confronts the mea-

surement problems his theory involves. He lists a number of stratification criteria, but he never explains how to decide which estate an individual should be placed in if all these criteria must be taken into account, nor does he explain how to identify discrete estates when the criteria not only overlap but also consist of continua rather than of unambiguously bounded categories. Nor is the problem of weighting considered. In short, the author fails to consider the stratification literature of the past 30 years.

Third, Mousnier's theory of emotional stratification—high positions are filled by those with the most ardent faith—is hard to believe. Apart from the problem of measuring degrees of fervor, the notion that popes, princes, and presidents attained their positions because their faith was more ardent than that of acolytes, nuns, peasants, factory workers, or housewives contradicts both common sense and social science. The casual rejection of the findings of thousands of stratification studies makes this book almost useless to social scientists.

JOAN HUBER
University of Illinois, Urbana-Champaign

Manuel de Pratique Diplomatique: L'Ambassade. By Farag Moussa. (Brussels: Bruylant, 1972. Pp. 411. 1.569 francs.)

It is often said that the role of the ambassador has become less and less important with the passage of time and the changing world order—especially with the coming of instant communications and the arrival of a whole host of technical problems that have to be dealt with through diplomatic channels. With detailed instructions from the foreign office on every important issue, the argument runs, and with a steady flow of technical experts going abroad to negotiate particular problems, what is there left for the ambassador to do?

This question, as well as many related issues, are ably dealt with by the author in his handbook on modern diplomacy. He includes a discussion of the nature of the modern embassy and other types of diplomatic missions, the structure and organization of the embassy, the members of the ambassador's team and their functions, the relations of the embassy with the authorities of the sending and receiving states and with other foreign embassies, the relations of the embassy with the press—a problem of growing importance—and other special problems such as the role of the non-resident ambassador, the protection by the embassy of the interests of third states, and the special status of ambassadors who represent more than one state.

The book is designed to fill three main gaps in the literature on the practice of modern diplomacy. First of all, the classical works of the interwar years, like those of Raoul Genet and Ernest Satow, are no longer as useful as they once were. The emphasis of this book is on the realities of contemporary diplomacy, and most of the illustrations are drawn from the postwar period down to 1971. Second, most recent works on the subject place a good deal of emphasis on the legal and protocol aspects of diplomacy; Moussa's emphasis is on practice rather than theory. Finally, it should be noted that, unlike most of the books on diplomacy which deal with the diplomacy of international conferences or special diplomatic missions, this one is basically a study of the embassy as an instrument of bilateral diplomacy.

The author is well equipped, both by temperament and background, to carry out his mission. He is the son of an Egyptian career diplomat and has himself served both in the foreign service of his country and as an international civil servant with the Arab League. Consequently, he has consulted not only the books and memoirs written by scholars and diplomats, he has also put to effective use the diplomatic lists, the circular notes and the directives put out by various embassies and foreign offices. Moreover, in the preparation of his manuscript, he has conferred with many diplomats at all levels representing different kinds of countries and social systems. As a result, the book contains a good many helpful examples and illustrations of the main points made in the text, with numerous references to the experience of the new nations.

The writer's principal concern is the embassy and, of course, the embassy's principal officer, the ambassador. Admittedly, the ambassador's role has undergone great changes during this century. Today, for example, there are some 50 agencies and departments of the United States government interested in foreign policy and many of these have representatives stationed abroad. As a result, our ambassadors in many posts find themselves surrounded by commercial, labor, agricultural and military attaches, CIA officials, foreign-aid and treasury experts, public affairs and cultural relations officers, and a host of other technical experts. They thus tend to function more as managers of a team than as chief negotiators for their governments.

Yet even in his negotiating role, as the author points out, the ambassador serves as much more than just a letter box whose principal mission is to deliver messages from the Department of State or the Foreign Office. In the normal course of events he enjoys considerable latitude. In a good many areas of activity, for example, most ambassadors are not tied down by specific in-

structions from their foreign offices. Moreover, some of them may have played an important role in framing the foreign policies of their governments and in formulating their own set of instructions, and they always have the privilege of recommending changes in their instructions, many of which are accepted by their foreign offices. There are other tricks in the trade, as well: some may find it more convenient to follow the spirit of their instructions rather than the precise letter, while others may even ignore or hold up the execution of their instructions for a period of time. Finally, the *manner* in which ambassadors transmit or present their government's views may be as important as the communications themselves.

Aspiring young foreign service officers will be glad to know that even in this rapidly shrinking world of ours, the ambassador still has an important part to play in the great drama of international politics. And whether they aspire to be ambassadors or not I strongly recommend this book to them—and to all others interested in the modern embassy—for it is exceptionally well organized, easy to read, and very well documented. We owe the Carnegie Endowment for International Peace still another debt of gratitude for sponsoring this very useful project.

FRANCIS O. WILCOX
The Johns Hopkins University
School of Advanced International Studies

The United Nations: A Reassessment—Sanctions, Peacekeeping, and Humanitarian Assistance. Edited by John M. Paxman and George T. Boggs. (Charlottesville: University Press of Virginia, 1973. Pp. xii, 153. $10.00.)

Not long ago, serious assessments of the United Nations more often than not were somewhat optimistic in outlook, even when they expressed doubts about the commitments of governments to a powerful organization. Emphasis tended to be upon growth of UN programs and the potential for constructive development in the direction of expanded UN services and functions.

The overall tone of this book is radically different. In this volume, the product of a symposium held at the University of Virginia School of Law in March, 1972, the contributors question again and again the fundamental ability of the United Nations to serve the world order system effectively. For example, on the first page of their preface, the editors assert that the organization's "record of response to the needs of the international community in the recent past has at best been shabby" (p. vii), Richard Falk comments on the inability of the UN to deal with the growing worldwide ecological challenge effectively, and suggests that a "central guidance capability"—which, presumably cannot be engendered through the UN—is required for ecological salvation. Michael Reisman states of the Bangladesh war that "the quintessential obscenity of this holocaust was the attempt by the Security Council to condemn India as an aggressor when India decided to intervene and stop the carnage in East Pakistan" (p. 31). John Salzberg argues, also of the Bangladesh crisis, that "the failure of the United Nations to fully respond to . . . the massive violations of human rights (by the Pakistani government) contributed to the inevitability of the armed conflict" (p. 114).

But it is Gidon Gottlieb, in the book's lead article, who raises the most fundamental challenge when he declares that "conventional wisdom that the United Nations should be made more effective is no longer taken for granted" (p. 1). He then expresses "ten fundamental doubts" in the form of questions, about the desirability of trying to make the UN more effective. The author is clearly nagged in particular by two basic kinds of questions about the very essence of the UN. The first reflects his skepticism that Charter provisions speak realistically and authoritatively to the political divisions of today's world. The second expresses the fear that a more "effective" UN, far from providing a transition to improved structures of world order, would only legitimize further the virtually unchecked sovereignty of the 140 or so states of the world.

These are serious questions, deserving of the fullest consideration by a group of scholars gathered to "reassess" the work of the United Nations. Yet in spite of the evidence that a number of the contributors to this volume may share at least much of Gottlieb's skepticism, these questions are not addressed in any very coherent fashion. The reader is left with the frustrating impression that the participants here (with a very few exceptions) are prepared only to "muddle through" in about the same way as the UN itself does, offering serious criticisms of various aspects of the work of the organization, but little in the way of suggestions for constructive alternatives.

This sense of frustration is no doubt heightened by the problems inherent in any symposium format—problems that seem magnified when the symposium is reduced to print. First, the contributions are of uneven quality and tone. Some are imaginative and original (Reisman's discussion of civic enforcement of international humanitarian law is a good case in point). Others are little more than *reportage* of the details of events that might not be widely known, while still others (most notably, the discussions by U.S. and Soviet spokesmen of UN peacekeeping forces) are

largely presentations of two governmental positions that are by now depressingly familiar.

Second, however time-honored the practice of asking a selected few to introduce symposium topics for panel discussion, such introductory comments cry out for further development when one sees them published. It is no disparagement of the remarks of Inis L. Claude, Jr., John Norton Moore, and Richard B. Lillich to say that the page or two allotted each is scarcely sufficient for provocative comments on the issues of sanctions, peacekeeping, and humanitarian assistance, respectively. Finally, the commentary and discussion following each section is only as interesting or relevant as the individual speaker chose to make it. Discussions of matters tangential to the subject do not enhance the reader's sense of coherent and fully developed analysis, whatever snippets of knowledge or insight they may contain.

If the profound reservations expressed in this volume about the capacity of the United Nations to respond effectively to world order needs are warranted—and many of them surely are—then this is the time for more serious attention to constructive alternatives to, or revisions of, the UN system. One can only hope that effective action will be taken before, rather than after, the system collapses catastrophically. Perhaps the chief merit of books such as this one is that they remind us of the urgency of that task.

LYNN H. MILLER

Temple University

The Politics of Nuclear Proliferation. By George H. Quester. (Baltimore, Md.: The Johns Hopkins University Press, 1973. Pp. 245. $11.50.)

In an uncertain international order, in which the influence of the superpowers may be declining, the norms of behavior familiar during the years of their universal antagonism may be dissolving and the autonomy of a certain kind of middle power may be increasing—in this setting the issue of nuclear proliferation is beginning once again to appear on the agenda of world politics. India exploded an underground nuclear "device" early in 1974. The dramatic rise in the cost of fossil fuels has enhanced the importance of nuclear reactors, of which weapons-grade fissionable material can be a byproduct, in both national and international politics, as evidenced by the Nixon promise of both fuel and reactors to Israel and Egypt, or France's deal with Iran. And in May 1975 a major international conference will review the operation of the Non-Proliferation Treaty which was agreed upon in 1968 and became effective in 1970.

By its provisions the superpowers sought to limit the nuclear club to its then five members—the Soviet Union, the United States, Britain, France and China—with a vague promise to engage in arms limitation themselves, even vaguer guarantees of support for non-nuclear powers subjected to nuclear threats, and complex provisions for using the International Atomic Energy Agency to prevent the diversion of nuclear material and technology from civil to military purposes. It was an instrument imposed on the international community by the superpowers with the support of one other member of the club of five—Britain, plus two or three near-nuclear powers—Canada and Sweden, for instance, and of a host of small countries who could never aspire to such a status and feared the consequences of proliferation for regional order in their area. Will it hold in a situation where the evolution of a "special relationship" between Washington and Moscow may be inescapable, the value of nuclear guarantees more dubious than ever, and access to weapon technology and nuclear materials is steadily becoming more diffused?

Professor Quester knows a great deal about this problem and has chosen to make a particular kind of contribution to the elucidation of it. He has not re-examined the arguments for and against nuclear proliferation, or its probable impact on world politics, which was hotly debated by such writers as Pierre Gallois and Leonard Beaton, or examined by Stanley Hoffman, Raymond Aron, myself, and many others, in the 1960s. Instead he has been traveling to the capitals of the countries that were particularly outraged or nervous in the later 1960s at the prospect of foregoing the nuclear option forever, and has listened to the arguments taking place there. It is a book about probabilities rather than consequences, and this explains the arrangement of his chapters. After a rather perfunctory examination of the Soviet and the American positions on proliferation and the Treaty, he takes us immediately to New Delhi (India never signed the NPT). Although the book was published at the end of 1973, he can be said effectively to have forecast the Indian bomb, in the form it took, namely a so called "peaceful" explosion, detonated underground, largely designed to assert Indian scientific prestige and political credibility, and in the knowledge that neither superpower would be prepared to react forcefully against an action by so large a country yet not affecting their own security. Professor Quester doubts, however, whether India can rest content simply with a demonstration of nuclear know-how and argues that she may find herself on the same escalator as her five nuclear predecessors: "In

terms of India's image, an early detonation without a rapid follow-up to H-bombs and advanced delivery systems might also make India look foolish and incompetent for the longer run, as Indian postdetonation progress will inevitably be compared with that of Communist China" (p. 80).

He then takes us to Jerusalem (he rightly talks of capital cities, since nuclear weapons are the subject of debate between scientist, soldier, official and politician, not voters). Israel too is a nonsignatory of the Treaty, and Jerusalem had strong strategic incentives, even before the Yom Kippur war, for introducing a more effective system of local deterrence than ground and air forces: yet it would be politically ruinous for her relationship with the United States or the hope of any progress in relation with her neighbors, to test a nuclear bomb. He tells us, "It is thus entirely possible that Israel will become the first example of quasi-proliferation, understood to have nuclear weapons ready to fire but never having proved this, to those in the world who require a detonation as a proof" (p. 102).

From Jerusalem the examination moves to Tokyo, the capital of an advanced yet vulnerable country, whose experts can envisage no specific scenario that would require a Japanese bomb but where "the NPT seems to imply that Japan is taken for granted as acquiescent and not a great power . . . the loser of World War II (p. 111). And so on down the scale of probabilities: Stockholm, where the nuclear option was seriously considered ten years ago and then rejected; Brasilia, Buenos Aires, and Santiago, capitals that wish to keep their options open; Ottawa, where it was long ago decided that a Canadian bomb made no sense; Canberra, where the debate was much sharper; Bonn, once the great source of Soviet anxieties but now more irked by the Treaty's inspection provisions than by its substance; Rome and Pretoria.

Professor Quester has made a useful contribution to expert discussion on proliferation, but he gives little assistance to the layman. He is weak on narrative, he is weak on the presentation of his sources, and he does not even help the reader with a simple table showing which countries had signed or ratified the Treaty when he wrote. He makes some mistakes of fact such as discussing Euratom as if it were still separate from the European Community, and, more important, he does not adequately discuss the relationship of other factors—the growing cost and complexity of delivery systems, the demography of the country whose leaders must make a choice, the stability or strength of government, the quality of its adversaries—to the nature of that choice.

ALASTAIR BUCHAN
Late of Oxford University

Third-Party Settlement of Disputes in Theory and Practice. By Lillian L. Randolph. (New York: Oceana Publications, Inc., 1973. Pp. 385. $18.50.)

The author's announced purpose is to demonstrate that independent third-party action generally can assist in obtaining peaceful resolution of and party satisfaction relating to disputes. In dealing with this worthy goal, Professor Randolph treats the role of third parties in international and "inter-nation" (municipal) situations. The author finds that the goal of peaceful resolution of disputes has special relevancy in the area of international disputes, particularly where the danger of catastrophic violence exists. The goal of party satisfaction relates more to municipal disputes.

We are told that the perspectives of the three participants in the process vary. Disputants are generally supportive of peaceful resolution or party satisfaction. Third-parties and the public are seen as favoring resolution because of concern over catastrophic violence. It is argued that these interacting considerations will induce disputants to accept third-party judgments, since the larger interests of all will be served thereby.

The author accords enormous importance to public support as a condition for strong third-party authority, saying "such [support] enables third parties to proceed to resolution irrespective of the will of the parties" (p. 13). Instead of seeking to identify the reasons for the general defectiveness of public support—especially internationally—the author urges the improvement of the third-party process through the acceptance of national commitments to such dispute-resolving processes prior to the existence of a dispute or by at least allowing the third party's power to influence the other parties.

Professor Randolph examines the interplay of forces which contributes to successes or failures of third-party activities. One scheme of analysis was to compare settlements resulting from situations where a party or parties dominated the settlement process with settlements resulting from a mediator-dominated situation. The author concludes that a party-dominated situation was more likely to fail in resolving the dispute than when the process was mediator-dominated. Since the party-dominated situations were international in character, and since mediator-dominated situations were those having a municipal quality, the author concludes that the third-party process has not been very successful in mitigating the tensions of states. When, however, settlements of a regional nature were investigated, it was concluded that in the European region settlements were mediator-dominated. In

other regions the settlements were party-dominated.

The question must be asked whether the author's conclusions are sufficiently related to hard facts or to precisely identified concepts to be entirely credible. Unfortunately, she uses such terms in the argument as "public support," "catastrophic violence," "power," "party-mediator domination," "persuasion," and "enforcement," among others, without providing precise operational meanings for such concepts. Since so much of the author's thesis is based on the meaning attributed to these terms, and since the reader is given so little sense of meaning of these terms in the several contexts discussed, the value of the author's argument is diminished.

For example, in the case of "public support," it would be helpful to know the situs, quantity, quality, intensity, reliability, institutional framework, and sanctioning process related to such support in order to appraise the utility of the third-party process. Or, it would be helpful to be able to identify and measure the amount of violence which must be experienced before it becomes "catastrophic," whether, for example, catastrophic violence is limited to weapons capable of mass destruction, or whether such violence as a substantial or total interruption in the world movement of energy would qualify; or, indeed, how one would measure national or individual perceptions of the presence of such catastrophic violence. The book combines generalities and abstractions with much specific information, but the specifics often fail to support the more general propositions. One is left to speculate about the real availability of third-party processes, especially in disputes among nations. Nor does the author make clear in what circumstances it would be possible to derive substantial benefit at the world level from successful experience with municipal use of third-party processes.

The book contains four very detailed and useful appendices. The first lists world institutions applying permanent procedures and identifies cases which have come before them. The second lists states possessing membership in international tribunals and parties to international agreements or specified clauses providing solely for pacific settlement of disputes. The third identifies the voting records of national judges sitting on the World Court. The fourth is a synopsis of the activities of the World Court, the European Court of the Communities, and the European Commission of Human Rights.

Evolution and International Organization: Toward a New Level of Sociopolitical Integration. By Volker Rittberger. (The Hague: Martinus Nijhoff, 1973. Pp. 120. 22.50 guilders.)

Rittberger's volume is an interesting approach to the study of international organization using an evolutionary-theoretical framework. International organization is seen as a new distinct level of sociopolitical integration similar, in the evolutionary perspective, to other levels such as the state, the tribe, etc. The first and major part of the study attempts to establish a causal linkage between the advance of industrial civilization as a basic social force and its concomitant sociopolitical and ideological processes on the one hand, and the transition from the nation-state level to the international organization level of sociopolitical integration on the other. Rittberger contends that the linkage between these processes of change is mediated by the emergence of the intelligentsia, seen as a major sociostructural consequence of the advance of industrial civilization. Other independent variables likely to enhance the growth of international organization are highly destructive international wars and "previous international organization experience." The last variable is based on the belief that international organization seems to breed more international organization. Of particular relevance here is functionalist theory with its assertion that the successful transnational satisfaction of needs through intergovernmental organizations is likely to lead to additional organizational efforts.

An obvious problem is the operationalization and measurement of these variables. The spread of industrial civilization is measured by the production of pig iron and crude steel per capita of total population of all independent states. The measurement for the emergence of the intelligentsia is based on the number of students enrolled in institutions of higher learning as a proportion of the same total population, while the experience of war relies on the Singer-Wallace data on interstate wars. (J. David Singer and Michael Wallace, "Intergovernmental Organization and the Preservation of Peace, 1816-1964; Some Bivariate Relationships," *International Organization*, 24 [Spring 1970], 520-547). Finally, "previous international organization experience" and the growth of international organization, the dependent variable, emphasize the growth of IGO bureaucracies and are measured on the basis of budgetary expenditures of UN system and predecessor organizations as a proportion of national government expenditures.

Utilizing bivariate and multivariate analysis, Rittberger concludes from the correlations that

his hypothesis is basically confirmed. But the relationship between "previous international organization experience" and international organization building is ambiguous; it seems that these experiences contribute to the growth of UN specialized agencies rather than to that of the total United Nations system, supporting evidence perhaps for the functionalist theory and its law of "inverse salience" that declares that international organizations are more likely to grow when their tasks are less susceptible to controversial interpretation by national leadership groups. (Joseph S. Nye, *Peace in Parts* [Boston: Little, Brown, 1971], p. 98.)

Rittberger's second basic hypothesis posits that increases in international organization building tend to reduce the instances of warfare among nation-states. His correlation coefficients do not support this hypothesis, and therefore he suggests that international organization building within the global context is ineffectual as a constraint on national leadership groups, especially those of the major powers.

While the innovative theoretical nature of the book is appealing, some critical points must be raised:

(1) In much of the book Rittberger talks about "supranational bureaucracies" which seem to be equated with any IGO bureaucracy. Since the term "supranational" in much of the international organization literature has a special connotation referring to the ability of IGO institutions to issue binding regulations upon the population under their jurisdiction, the term should not be applied loosely.

(2) The term "integration" used frequently in Chapters 2-4 is not defined. In Chapter 5, however, we have a very extensive definitional discussion (pages 84-88), and the reader wonders whether or not this definition applies to the whole book.

(3) The measurements used for the first hypothesis seem to lack sufficient refinement for adequate results. The production of pig iron and crude steel as a measure of industrial technology, the indicator for the spread of industrial civilization, may not be appropriate for the last 25 years. Students enrollment in institutions of higher learning may be an inadequate measure for the emergence of the intelligentsia.

These comments should not detract from the fundamental value of this book, which is worthwhile reading for all interested in the study of international organization.

University of New Orleans

The Great Wheel: The World Monetary System, a Reinterpretation. By Sidney E. Rolfe and James Burtle. (New York: Quadrangle/The New York Times Book Co., 1973. Pp. 279. $9.95.)

The argument of this book—for it is primarily a polemic set in a historical frame—is directed mostly at business executives, practicing and presumptive, and at all those who operate in international markets and are (not unreasonably) anxious about the international monetary system with which they have to live. Not to worry, they are soothingly told. Lie back and enjoy it. All that scary stuff about competitive devaluation starting the world economy down the slippery path to economic nationalism and depression, the authors declare, is unscientific myth, an old wives' tale. Grown-up people should not be taken in. Of course floating rates of exchange do create problems, and you can lose your shirt—but the authors offer extensive, sensible and practical advice (pp. 195-255) on how best to cope with them.

The polemic shows good marketing sense. The prospect is for continuing inflation and thus for continuing instablity of exchange rates, so the book should sell well, especially in business schools and corporation finance departments.

But politics professors and students might also take a good look at it, especially the historical framework which takes up more than two-thirds of the book. There are minor inaccuracies and some rather rash and sweeping simplifications of complex historical processes. But it does provide the missing monetary dimension to a lot of international political history—and it does so in a brisk and commendably readable style, slowing the pace and expanding the supportive detail as the story approaches the present.

Used with caution, Chapter 12 on Mercantilism Revisited might also make a useful addition to reading lists for international political economy courses. It attempts a straightforward exposition of an important issue in contemporary international relations. Mercantilism is castigated by the authors—as by most neoclassical economists—as "the economic concomitant of nationalism," yet the text also makes it plain that from Keynes on, mercantilist policies have been primarily motivated by a genuine concern in government that the market economy should provide not just more wealth, but more welfare. This—as Cooper, Kindleberger, Camps, and others have perceived—is the central dilemma of economic interdependence. As men in an undergoverned frontier society sometimes had to violate social norms to secure their families' welfare, so governments in an undergoverned world

economy are sometimes led into policies that may well not serve the international interest. Even the United States—one might say particularly the United States—cannot escape this dilemma. Here, in a nutshell, is one reason for treating the authors' conclusions about the international monetary system with caution. For this Candide, at least, the book is altogether too Panglossian.

A second reason is that the main conclusion has been overtaken by the Arabs and their petrodollars. The authors contend that Special Drawing Rights (SDRs) could serve, like South African gold in the international monetary system of the 1890s and US dollar deficits in 1950s and 1960s, as the growth-engendering drive behind what Adam Smith called "the great wheel." But now we have the different problem of coping with too much liquidity—or at least too much liquidity in what is subjectively thought of as the "wrong" place.

A third reason is that at this point some rather flimsy—even deceptive—steps are built into the wall of argument. For instance, to say the United States Treasury introduced the idea of SDRs (p. 191) abbreviates the facts to the point of distortion. And it's a bit much to present Paul Einzig as a champion of SDRs when (as he would have quickly protested if he were alive now) he always maintained that the initials stood for "Speedier Doom Results."

SUSAN STRANGE
London School of Economics

International Studies and the Social Sciences: Problems, Priorities and Prospects in the United States. By James N. Rosenau. (Beverly Hills: Sage Publications, 1973. Pp. 147. $9.00, cloth; $5.00, paper.)

Five basic assumptions underlie *International Studies and the Social Sciences*, and if they are true, the impressive edifice built by Professor James Rosenau, in a study undertaken for the International Studies Association, survives and stands. If they are false or only partly true, the whole monolithic structure crumbles and falls as an independent and comprehensive system. The assumptions are: (1) International studies have undergone a scientific revolution. What preceded this revolution may have been useful for the times, but its philosophical and historical orientation and the older scholars who still espouse it have at best a minor and subordinate role for the future. (2) The decline of international studies in higher education results from the boredom of students who are introduced to current events and foreign policy problems but not given the analytical skills to understand them. (3) International studies have suffered from a "pressure for relevance [which is] insatiable" (p. 19). "Funding agencies want relevance; students want relevance; colleges want relevance. . . ." (p. 18). (4) The way to discover the parameters and growth of international studies is to request selected scholarly journals, whose editorial boards have in recent years weighted the field in a given way, to pick an elite sample of generalists and send them questionnaires. When less than half reply to a question, write this off as a methodological error or the impatience of scholars with details. (5) There is a widespread skepticism about the scientific approach. "From the President of the United States to the local newspaper editor, from the halls of Congress to . . . academe, from the seats of power to the centers of revolution . . . social science is seen more as an obstacle than a tool of progress" (p. 76). The answer to skepticism is to mount "campaigns designed to educate officials and publics. . . ." (p. 77). "Either through the International Studies Association or some other appropriate organization, the case . . . should be energetically and continuously pressed on the society and its public officials" (p. 109).

The tragedy of the present study with all its advanced scientific terminology and apparatus is that these five propositions or underlying assumptions are at most only partially true. Indeed, for them to be otherwise would be a refutation of everything we know about the advancement of knowledge. Most of the study's conclusions are inherent in the approach; the methodology and the questions raised not surprisingly reflect a clearcut and well-stated viewpoint. In this the study is not unique. Its uniqueness rests only in the pretense it brings no fixed views to the problem. Listen to its credo: the wave of the future is with "quantification, advanced methodologies, and technical terminology," and "these outlooks and procedures will lead to increased comprehension and an enhancement of man's ability to cope with new challenges" (p. 78). Not only does the study represent a point of view; a missionary effort on the part of ISA or others is called for to propagate and extend the viewpoint. Some modest role remains for other outlooks and procedures. For example "the commitment to explicitness and precision in research does not preclude the use of intuition and imagination in the formulation of problems and hypotheses" (p. 78). Yet to pretend for one moment that Rosenau and his colleagues don't bring to their study commitments that virtually predetermine their inquiry's shape and direction is illusory. Nor would it be any different for those of us with opposing views and assumptions—say, the members of the Niebuhr panel at the 1974 annual

meetings of the American Political Science Association.

My criticism, then, is that Rosenau's criteria of selection of questions and issues and the use he makes of his dramatis personnae once he has them prejudge all the interesting and oft-debated problems he considers. But on his specific assumptions: (1) The scientific revolution he heralds has had far more modest results than he proclaims. That rather ancient group of pre-scientific historians and philosophers such as Niebuhr, Kennan, Marshall, Halle, and Morgenthau continue to be read, and a new group has emerged, all absent from his elite sample but including Brzezinski, Deutsch, Hoffman, Claude, Huntington, Osgood, and Sterling—and yes, Kissinger. Something must be wrong with a study whose computer failed to pick up even one of this group. (2) If students, especially in the late 1960s were bored with current events and foreign policy problems, how much greater was their boredom with diagrams and models (an objective questionnaire would be useful here)? (3) The pressure for relevance can be overdone. Paul Freund notes that if he had studied only what was relevant as a student in the 1930s he would never have gone beyond business cycles. Is there an opposite risk of making a fetish of what is patently irrelevant to the consumer or patient in the bed? (4) The overall framework of the Rosenau study leads to the selection of certain journals, certain scholars (see my alternative list above) and certain questions. Would the results have been the same if he had queried the editors of the *Review of Politics, Social Research, Foreign Policy, Foreign Affairs*, and *Political Science Quarterly*? (5) The approach to skeptics on science is comparable to that of recent nominating committees of APSA which year after year chose scholars representative of one school of thought and thereby invited contested elections. In 1974, the nominating committee had two choices: to continue this practice or to broaden the spectrum of political science by nominating someone well-regarded by all sectors. Rather than calling for a nationwide campaign for a single methodology and approach, I would challenge Rosenau to broaden his concept of science to include philosophy, policy analysis, and history. This might be a more promising way of reducing skepticism while building networks of new mutualities of interest and respect. For all these reasons I find his assumptions incomplete and his study, while provocative and suggestive, less than the broad design required to describe contemporary international studies.

KENNETH W. THOMPSON
International Council for Educational Development

Western Technology and Soviet Economic Development, 1930 to 1945. By Antony C. Sutton. (Stanford, Calif.: Hoover Institution Press, 1971. Pp. 401. $10.00.)

This book is Mr. Sutton's second volume in a three-volume series on the transfer of western technology to the Soviet Union. Mr. Sutton's present work covers the period 1930 to 1945 when the Soviet economy largely acquired its present industrialized base. The author, a Research Fellow at the Hoover Institution, quotes Stalin as saying that about two-thirds of all the large industrial enterprises constructed in the Soviet Union before and during World War II were built with United States help or technical assistance. The author maintains that Stalin forgot to mention the remaining one-third of the enterprises. These, Mr. Sutton contends, were the result of technical assistance provided by the industrialized nations of western Europe—largely Germany.

Against this background of Soviet economic development, Mr. Sutton advances his "inability hypothesis" concerning the Soviets' lack of indigenous technical ability to generate their own progress, hence the heavy dependence on western technological transfers. Although major writers on the Soviet economy have recognized the importance of Soviet dependence on western technology, this aspect of Soviet industrialization has not been fully examined. Mr. Sutton sets out "to close the empirical gap" on the amount and the extent of Soviet borrowing from the West.

The author has done a prodigious amount of research work to support his hypothesis. The bulk of his material comes from the U.S. State Department Decimal File and official German sources, as official Soviet sources were not too plentiful for this period. In addition, he has covered the relevant major western industrial and financial publications. The data are well organized and clearly presented. After stating his objectives, Sutton deals with the Soviet termination of foreign concessions in the early 1930s, and he concludes ". . . that any joint enterprise with a Communist nation is inexorably destined for seizure when the advantages to the Communist nation have ceased or when no further financial or technological investment can be extracted from the foreign partner" (p. 31).

After the Soviets had experimented with concessionary agreements, they turned to the technical assistance agreements and individual contracts with foreign companies, engineers and consultants. It is this type of agreement that Mr. Sutton investigates and analyzes during the period under review. He treats the various industries on a chapter by chapter basis, and his grasp of the technical details is superb. There are or-

ganizational charts, engineering designs, photographs of equipment, tables of data, helpful footnotes, appendices, bibliography and an excellent index to satisfy the requirements of serious scholarship. One minor shortcoming in his organization of the material is that some chapters have conclusions while others, for no apparent reason, do not.

Following his treatment of the major industrial sectors of the Soviet economy, Mr. Sutton analyzes the process of technical transfer and the problems the westerners encountered as well as the difficulties the Soviets experienced with the assimilation of the borrowed technology. Mr. Sutton then compares the amount of western technology received with Soviet growth rates for various sectors of the economy for the period 1930-1945. He finds that the sectors of the Soviet economy which experienced high growth rates were mainly the ones which received western technical assistance. These areas were primarily in heavy industry. In his conclusion he returns to his "inability hypothesis" and finds that the data support this hypothesis. He only finds two major Soviet innovations, SKB synthetic rubber and the Ramzin "once-through" boiler, and points out that these were supplemented with western methods by 1945. Mr. Sutton recognizes an additional Soviet achievement in the conversion of American and British equipment to the metric system. Hence, Soviet technology from 1930 to 1945 was western technology converted to the metric system.

One finds it very hard to disagree with Mr. Sutton's findings. If anything, he overstates his case, but it would be extremely difficult to refute the mass of evidence he presents. At times, he seems to begrudge the Soviets this transfer of technology and lays inordinate stress on Soviet technological inabilities. In point of fact, once the Soviets made the decision to industrialize, deliberate borrowing from the West was the primary means of achieving this end, especially since many engineers from the old regime had fled abroad and those that remained were regarded with suspicion. In effect, their policies resulted in a minor technological transfer in reverse. Also, Sutton fails to mention the depression of the 1930s in the West, and its effect on idle firms and unemployed engineers. These were able to maintain their salaries and skills working on projects in the Soviet Union.

In the course of examining the transfer of technology from the West to the Soviets, this study throws an interesting and surprising sidelight on the subject of doing business with the Soviets. The West has not generally approved of Soviet foreign and domestic policies, but there exists in many quarters a strong opinion that the Soviets have excellent credit and keep their word with respect to business agreements. This view is touted during the present time of detente when the Soviets are seeking trade concessions. Those businessmen who are seeking opportunities in the Soviet Union would do well to read Mr. Sutton's book. Perhaps the Soviets have changed, but during the period under review the Soviet record shows breaches of contract, unethical practices, patent infringements, defaults on salary payments, pirating of designs and much evidence of bad faith in their dealings.

Mr. Sutton's book is a valuable contribution to the literature on the Soviet economy. It might be suggested as a supplemental text in courses in comparative economic systems and in economic growth and development. The bulk of development literature deals with various types of growth models, some of which are very sophisticated and highly theoretical. Mr. Sutton's method of dealing with technological transfers, an important component of economic development, demonstrates that an extremely complicated process can be analyzed and presented in a clear manner by diligent and patient research. His preferences are obviously for a market-type economic system, but he concludes: "In the light of the history of technological transfers, the Soviet choice of western techniques has been superb" (p. 292). That the Soviets have adopted western technology is beyond doubt. The hypothesis which needs to be tested for the present is whether a centralized planning system can put it to work efficiently.

CARL B. TURNER

North Carolina State University, Raleigh

Political Science on the firing line

The book that closes the gap between the classroom and practical government.

Free & Independent

The Initiation of a College Professor into State Politics

Step-by-step through the Ongoing Dynamics of Politics and Legislation

by FRANK SMALLWOOD
DARTMOUTH COLLEGE
Vermont State Senate, 1972-74

FRANK SMALLWOOD has been a professor at Dartmouth College since 1960, currently serving both as the Orvil E. Dryfoos Professor of Public Affairs and as a vice president and dean of student affairs. He lives in Norwich, Vermont, and it is from this base—and out of the conviction that "there is an important difference between studying and doing"—that he utilized his first sabbatical leave in ten years to enter politics.

The uses of Political Science in Actual Practice

Thus, FREE AND INDEPENDENT is a first-person account, lively and absorbing, of a political scientist's venture into the political arena. Smallwood campaigned for office, he was elected, and he served two years in the Vermont State Senate. At every step, he faced practical challenges, first on the firing line of electioneering, then in legislative battles over such issues as women's rights, land use, energy, health and welfare, the environment and tax reform, plus more routine but important bills that don't grab the headlines but still affect us all.

This book reveals the realities of political life behind the scenes of politicking and legislating where our laws begin: the state legislature. It illustrates for the teacher the uses of political science throughout the political process.

235 pages. Biblio. Index. Hardbound $10.95. Classroom edition, paperback, $5.95. Educational discounts apply. 10 days' exam privilege without obligation. Address Dept. PS

PARTIAL CONTENTS:

When your book is out of print, is it out of reach?

It needn't be. It used to be that when a book went out of print, it went out of reach . . . at least, out of convenient reach. As many as 35,000 titles have faced oblivion each year . . . many of them important works by distinguished scholars. You can stop that from happening to your book, and assure its continuing availability, through University Microfilms on-demand reprint service. And you can receive the following benefits:

Continuing promotion: a bibliographic record of your title will be maintained in the Books on Demand data base for promotion in our comprehensive catalog and subject bibliographies when appropriate.

Demand Reprint Service: a microfilm master will be made of your book and preserved in our vault for production of bound Xerographic or microfilm reprints on demand.

Author's Copy: you will receive a microfilm copy of your book for your personal library.

Royalties: a royalty will be paid for all reprint sales of your book.

Available on Demand permanently: to make your book permanently available on demand, you are asked to sign a reprint agreement, furnish us with a non-returnable copy of your book, and pay a modest fee to cover the cost of the services. A small effort, indeed, to keep your book within reach . . . permanently.

FOR FURTHER INFORMATION and a reprint agreement, please write: University Microfilms International, Author Program Coordinator, 300 North Zeeb Road, Ann Arbor, Michigan, 48106.

America in an Interdependent World

Problems of United States Foreign Policy
David A. Baldwin, editor
American responses to an interdependent world are the foci of this multidisciplinary study. Old perceptions of an invulnerable America serving as the world's breadbasket, conscience, and policeman are being increasingly questioned. The present book, an outgrowth of a faculty study group organized at Dartmouth College and sponsored by the Department of State, identifies a number of major foreign-policy problems that will face the United States in the next five years. The authors emphasize the need for a fundamental reassessment of America's world role in terms of long-range trends in the international system.

Contents
Foreword/*Gene M. Lyons*
Foreign Policy Problems, 1975–1980: Framework for Analysis/*David A. Baldwin*
Who Next? The Spread of Nuclear Weapons/*Louis Morton*

HARVARD LAW SCHOOL

CAMBRIDGE · MASSACHUSETTS · 02138

Liberal Arts Fellowships in Law

For the academic year 1977-78 Harvard Law School offers four or five Liberal Arts Fellowships to college and university teachers in the arts and sciences for a year at the Harvard Law School. Holders of these Fellowships will have the title of Fellow in Law and . . . (History, Sociology, Political Science, Economics, Philosophy, etc., depending upon their particular discipline).

The purpose of the fellowships is to enable teachers in the social sciences or humanities to study fundamental techniques, concepts, and aims of law, so that, in their teaching and research, they will be better able to use legal materials and legal insights which are relevant to their own disciplines.

Fellowship holders will presumably take at least two first-year courses in law, in addition to more advanced courses, and will participate in a joint seminar. The year of study will not count toward a degree.

The fellowship grant covers tuition and health fees only. The Chairman of the Liberal Arts Fellowships Committee will be glad to write a letter to any funding agency to which the applicant has applied describing the Program and indicating the extent of the Committee's interest in inviting the applicant to be a Fellow.

Applications should include a biographical résumé (including academic record and list of publications), a statement explaining what the applicant hopes to achieve through his year of study, and two letters of recommendation (mailed to the Chairman directly from the referees). There is no special application form.

Applications for 1977-78 should be submitted before January 15, 1977, to the Chairman, Committee on Liberal Arts Fellowships, Harvard Law School, Cambridge, Massachusetts 02138.

Awards will be announced before February 15, 1977.

NEW FROM PRINCETON

Democracy Without Consensus
Communalism and Political Stability in Malaysia
KARL VON VORYS
By examining the political development of Malaysia, a country which has experimented with changes in the democratic model, the author discusses forms of democratic systems adopted by states emerging from colonial rule since World War II. "This is an important case study in developmental politics.... Von Vorys helps to restore the explanation of political development to the realm of politics (where it belongs)...." *— Milton J. Esman, Center for International Studies, Cornell University* $20.00

The Vietnam War and International Law
Volume 4: The Concluding Phase
Edited by RICHARD A. FALK
This concluding volume of *The Vietnam War and International Law* focuses on the last stages of America's combat role in Indochina. Contributors to the volume—lawyers, scholars, and government officials—include Dean Rusk, Eugene V. Rostow, Richard A. Falk, John Norton Moore, and Richard Wasserstrom. *Sponsored by the American Society of International Law.* Cloth, $35.00 • Limited Paperback Edition, $13.50

The Chinese Communist Treatment of Counter-revolutionaries, 1924-1949
PATRICIA GRIFFIN
Griffin contends that an understanding of how the Chinese Communists created a legal system at a time of rapid shifts in the political culture is essential to a grasp of more recent events. Focusing on the Communists' definition and treatment of counter-revolutionaries, she described and assesses the contribution of environment, ideology, and leadership in the development of legal techniques used by the Communists in their rise to power. *Studies in East Asian Law, Harvard University.* $15.00

Conflict in Africa
Concepts and Realities
ADDA B. BOZEMAN
The author compares Western ideas about conflict and its resolution to the nature of conflict in Africa south of the Sahara in its many social, political, and cultural aspects. Bozeman shows how African perspectives on war and diplomacy have evolved under the influence of non-literacy, tribalism, and a concept of undifferentiated time, and concludes that Western concepts cannot apply to African realities. Cloth, $27.50 • Limited Paperback Edition, $12.50

The Colonial Transformation of Kenya
The Kamba, Kikuyu, and Maasai from 1900 to 1939
ROBERT L. TIGNOR
"This is one of the best researched volumes on twentieth-century East African affairs that I have read. The whole study is based upon sound and judicious interpretations drawn from an impressive body of raw materials. In almost every chapter there are important new interpretations of events."— *Norman R. Bennett, Boston University* $25.00

Legal Reform in Occupied Japan
A Participant Looks Back
ALFRED C. OPPLER
After a distinguished career as a jurist in Germany, Alfred Oppler came to the United States in 1939, and in 1946 he was invited to Tokyo, where he was SCAP's authority on reform of the Japanese legal order to implement the principles of the new Constitution. Here is the account of the legal reforms and the methods used to achieve them. $20.00

Unchosen Presidents

The Vice President and Other Frustrations of Presidential Succession

Allan P. Sindler

How best to provide for presidential succession, an old and vexing American problem, has taken on a new urgency with the extraordinary events of 1973-1974. Sindler clears out much of the heavy underbrush obscuring the subject. "A keen, succinct study of the problems of Presidential succession." —*Kirkus Reviews*

128 pages, $5.95

The Drugging of the Americas

How Multinational Drug Companies Say One Thing About Their Products to Physicians in the United States, and Another Thing to Physicians in Latin America

Milton Silverman

Drug companies in the United States are required by law to limit their claims to what they can prove,, and to make full disclosure of all known hazards. Silverman finds that many multinational drug companies are circumventing similar laws in Latin America in order to sell more of their products. He provides detailed comparisons of the promotion of 28 separate prescription drugs in the U.S. and Latin America.

161 pages, $8.00

Landownership in Nepal

Mahesh C. Regmi

In his Foreward Leo Rose refers to this book as "the most important volume yet published on Nepal," where 93 percent of the population engages in agriculture. Land is the prime source of wealth, and ownership of land has historically implied prestige, affluence, and power

269 pages, $15.00

Fascism: A Reader's Guide

Analysis, Interpretations, and Bibliography

Edited by Walter Laqueur

Despite the three decades that have passed since the end of the second world war, fascism remains a subject of heated argument and controversy. Here, in what is undoubtedly the definitive treatment of fascism, thirteen authorities provide both a much-needed reference handbook and an original work of synthesis and new interpretation.

500 pages, $25.00

Peking Politics, 1918-1923

Factionalism and the Failure of Constitutionalism

Andrew J. Nathan

Although political discussion in early Republican China centered on the faith that a proper constitution would make China strong, factionalism repeatedly brought constitutions to naught. Nathan analyzes both the sources of the constitutionalist faith and the destructive effects of factionalism.

318 pages, $15.00

The Arabs and Zionism Before World War I

Neville J. Mandel

Mandel explodes the myth that the Arabs discovered the "challenge" of Zionism only as a consequence of the Balfour Declaration. He has discovered that, contrary to popular belief, the Arabs were aware of Zionist aims and activities in Palestine before 1914—and largely opposed to them.

268 pages, Illustrated, $13.50

The Africanization of Jobs

Educational and Occupational Segmentations in the Camerouns

Remi Clignet

Clignet shows that the extent and form of bargaining power enjoyed by differing types of wage earners and their employers vary widely. As a result, the influence of education on modes of entry into the labor force, on patterns of access to higher skill levels, and finally on income is culturally relative.

Supplementary Empirical Teaching Units in Political Science: American Politics

New computer related instructional materials whereby students learn important substantive topics in American politics as they learn methods of analysis.

Seven SETUPS are Available Now for Class Use

Voting Behavior: The 1972 Election by Bruce D. Bowen, C. Anthony Broh, Charles L. Prysby.

Political Socialization Across the Generations by Paul Allen Beck, Jere W. Bruner, L. Douglas Dobson.

Political Participation by F. Christopher Arterton, Harlan Hahn.

The Supreme Court in American Politics: Policy Through Law by John Paul Ryan, C. Neal Tate.

U.S. Energy, Environment and Economic Problems: A Public Policy Simulation by Barry Hughes.

Representation in the United States Congress: 1973 by Ray A. Geigle and Peter J. Hartjens.

The Dynamics of Political Budgeting: A Public Policy Simulation by Marvin K. Hoffman.

Each SETUPS is a module that can be taught in one to two weeks. SETUPS were designed to supplement instruction in introductory courses. But SETUPS have been field tested successfully in upper division courses. SETUPS were developed by faculty in a workshop supported by a grant from the National Science Foundation to the American Political Science Association and hosted by the Inter-University Consortium for Political Research, summer, 1974.

Each SETUPS Module Includes a Monograph and a Data Set

The monograph is a 5½" x 8½" paperback of approximately 100 pages with:

1. A substantive essay on the topic.
2. Analytical exercises.
3. Instructions about how to do the exercises.
4. Suggestions for further readings and exercises.
5. A code book for the data set.

The data set is prepared and distributed by the Inter-University Consortium for Political Research. The SETUPS data can be ordered for use with SPSS, OSIRIS or as card image.

The minimum SETUPS order is 25 copies–in any combination of titles. Each SETUPS will cost $3.50. *(Note: We are reducing the price in response to the demand.)* Lower prices are arranged for bulk orders. An order for 25 or more SETUPS will entitle you to the data sets for *all the SETUPS* at no extra charge.

TO ORDER SETUPS

Fill out the form below and the SETUPS Monographs will be sent to your bookstore. When we confirm the bookstore order, we shall send you a data-specification form.

Please complete and return this form to:

LO SPETTATORE INTERNAZIONALE

A quarterly review of international politics published in English by the Istituto Affari Internazionali (IAI) of Rome. Each issue contains articles by Italian and foreign authors and a regular survey of Italy's position in international politics and commerce.

Among the articles published in the last issue of 1975 were the following:

Cesare Merlini — *Italy's Role in the International Scenario*

Stefano Silvestri — *The International Political System*

Roberto Aliboni — *Economic Policies and International Co-operation*

Gianni Bonvicini — *The Foreign Relations of the European Community and Political Co-operation*

Gianluca Devoto — *Italy's Armaments Program and Nuclear Proliferation*

Vincenzo Russo — *Italy's Monetary Policy*

Maria Valeria Agostini — *Italy's Regional Policy*

Bona Pozzoli — *Italy's Bilateral Policy*

In forthcoming issues of 1976 articles on the EEC's Mediterranean policy, arms standardization, the changing situation in southern Europe, investment and labor in the Mediterranean, and Italy's place in the international scene will be featured.

New from

THE POLITICS OF EXCLUSION
MICHAEL N. DANIELSON

The Politics of Exclusion is an account of the attempt to open up the suburbs to the urban poor. An in-depth study of the social and economic motives underlying exclusionary housing practices, this is an important book for political scientists and for those interested in urban politics, urban planning, and social reform.
cloth, $17.50; paper, $5.95

DEVELOPING THE ICBM
A Study in Bureaucratic Politics
EDMUND BEARD

This Bancroft Award-winning study traces the development of the American intercontinental ballistic missile. Stressing the interrelation of politics, strategy, and weapons choice, the author demonstrates that cultural resistance within the Air Force to the idea of long-range ballistic rockets was at least as important as technological or strategic factors in dictating the weapon's progress. $15.00

THE "TAR BABY" OPTION
American Policy Toward Southern Rhodesia
ANTHONY LAKE

Feeling that "no area of the world has been viewed by Americans with greater moral disapproval and yet less attention than southern Africa," author Anthony Lake offers this detailed account of America's Southern Rhodesia policy since the Smith government's unilateral declaration of independence from Great Britain in 1965. The book provides information essential to an understanding of the current crisis in the region. cloth, $17.50; paper, $5.95

ELITE STRUCTURE AND IDEOLOGY
A Theory with Applications to Norway
JOHN HIGLEY, G. LOWELL FIELD, and KNUT GRØHOLT

Ranging over a large number of societies, historical and contemporary, this book presents a general theory of elite structure and ideology as they relate to political stability and instability. There is a special emphasis on Norwegian society with information presented in the context of the general theory. $17.50

COLUMBIA UNIVERSITY PRESS
Address for orders: 136 South Broadway, Irvington, New York 10533

Columbia

An important new book from the pages of *Political Science Quarterly*, "one of the liveliest and freshest of serious, scholarly journals"*:

AMERICAN POLITICAL INSTITUTIONS IN THE 1970s
A *Political Science Quarterly* Reader
DEMETRIOS CARALEY, Editor

The 1970s have been a time of remarkable turbulence and change on the American political scene. Noteworthy political events included the resignation of a president and vice president and the near bankruptcy of the nation's largest city, to name a few. Almost every one of the significant events of this period has been cogently discussed and analyzed in *Political Science Quarterly,* America's foremost political science journal. These timely and relevant essays are now brought together in book form. The collection is comprehensive and offers a useful tool for putting recent events in perspective.

Between these covers one can read Arthur M. Schlesinger, Jr., on presidential succession; Samuel P. Huntington on the dynamics of political change; Alpheus Thomas Mason on the Burger Court; Demetrios Caraley on congressional politics and the plight of the city; and many other leading scholars commenting on the key issues of the day. In addition, the historic Watergate briefs are reproduced in their entirety. This volume is not only an interesting account of this turbulent period but also a welcome background for the concerned voter in this election year.

cloth, $17.50; paper, $6.95

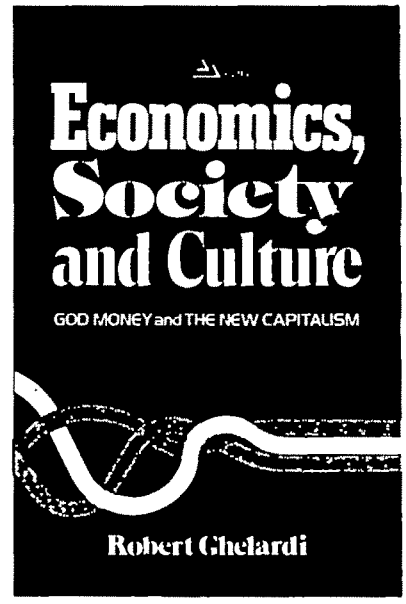
In paperback from Dell

God, Money and The New Capitalism are explored in

ECONOMICS, SOCIETY AND CULTURE



by Robert Ghelardi

Spotlighting the questionable origins and consequent fallacies of Keynes's economic philosophy—which has influenced American fiscal policy since World War II—this study is one of the first to show how economics can break out of its artificial self-containment to become, instead, a workable instrument of human culture and moral purpose.

Ghelardi proposes a new, arresting model of Western culture to which philosophy and all the arts are seen to conform. He identifies the foremost issue of our time as the conflict between the State's attempt to control the social order and culture's effect as society's most powerful integrator. Within this conflict, he finds the elusive middle way between capitalism's alienating individualism and the communist/socialist principles of collectivism.

Finally, Ghelardi eschews the Keynesian dogma and—although still drawing upon American economic tradition—demonstrates his theory's viability by citing case after case in which its spontaneous application has begun to render the words "inflation" and "depression" obsolete.

"This volume should be of interest all across the board in the social sciences, in government circles, and among communications specialists.

"It takes the theory of political participation considerably beyond its present Europe-America centered bias, and offers a definition that more effectively encompasses the varieties of participation in the so-called second and third worlds."

—Gabriel A. Almond

A sophisticated problem-focused book with far-reaching conclusions.

Political Participation in Developing Countries

Samuel P. Huntington and Joan M. Nelson

$10.50

Harvard University Press

Cambridge, Mass. 02138

On the Silence of the Declaration of Independence

Paul Eidelberg,
Henry Salvatori
Research Professor,
Claremont Men's College

Can the Declaration assume once again the importance and relevance it possessed for the statesmen of 1776? Paul Eidelberg proposes such a revitalization by examining elements overlooked in traditional interpretations. In the "silences" of the document he finds a semi-aristrocratic view of mankind, reflecting a dedication to reason and to qualities of civility more characteristic of *some* men than of men in general. He then uses these political principles to analyze contemporary political thought and policy.

128 pp., cloth, $7.00

Party Leadership in the States

Robert J. Huckshorn,
Florida Atlantic University

The first full-scale study of state party leadership and organization in this country. Interviews with eighty incumbent state party chairmen and over a hundred other party leaders detail the history of state parties, the legal basis for powers exercised by party officers and the social characteristics and career patterns of party officials. Both traditional and modern functions served by party chairmen are fully explored, followed by suggestions for reform and strengthening of state party organization.

" . . . one of the best studies of political parties as formal politics that I have seen. . . . Most of the material in this book is unique"—James A. Riedel, SUNY at Albany.

400 pp., cloth, $15.00

University of Massachusetts Press Box 429b Amherst, Mass. 01002

Listing and Order Form for Publications of the AMERICAN POLITICAL SCIENCE ASSOCIATION

THE AMERICAN POLITICAL SCIENCE REVIEW

Quarterly journal of scholarly articles and book reviews in political science. Included in APSA membership. Back issues: $10.50 per copy; $42.00 per volume.

PS

Quarterly journal of Association news and articles of professional concern. Included in APSA membership. Back issues: $2.00 per copy; $5.00 per volume.

DEA NEWS FOR TEACHERS OF POLITICAL SCIENCE

Newspaper on education and the curriculum. Included in APSA membership.

ANNUAL MEETING PROGRAM

Final program for APSA Annual Meeting. Included in Annual Meeting Registration. Extra copies: $.50.

APSA ANNUAL MEETING PAPERS**

Hard copies, $3.00 each.

APSA ANNUAL MEETING PROCEEDINGS**

Microfilm reels of all papers, 1901-1912; 1956-present. $22.00 per reel. (approx. 7 reels per meeting.)

CUMULATIVE INDEX TO THE AMERICAN POLITICAL SCIENCE REVIEW**

1906-1968, $6.50.

CUMULATIVE INDEX TO THE PROCEEDINGS OF THE ANNUAL MEETINGS**

Key word index to all papers included in proceedings of Annual Meetings for 1904-1912; 1956-1970: $18.50.

WOMEN IN POLITICAL SCIENCE: STUDIES AND REPORTS, 1969-71 OF THE APSA COMMITTEE ON THE STATUS OF WOMEN IN THE PROFESSION**

PB 486, $11.00.

POLITICAL SCIENCE THESAURUS

A major reference tool in political science; this volume represents the terminology control device for a computer-based information retrieval service. Individuals: Hardback: $20.00; Paper: $15.00. Institutions: Hardback: $30.00; Paper: $25.00.

APSA BIOGRAPHICAL DIRECTORY (Sixth Edition, 1973)

Biographical information on over 7,000 Association members, plus names and addresses for approximately 12,500 members. Members: Hardback: $7.50; Paper: $5.00. Non-Members: Hardback: $12.50; Paper: $10.00.

APSA DIRECTORY OF MEMBERS: ANNUAL SUPPLEMENT TO THE APSA BIOGRAPHICAL DIRECTORY

Names and current addresses of all APSA members. $3.00 each.

GUIDE TO PUBLICATION IN POLITICAL SCIENCE

Co-sponsored by the APSA Committee on the Status of Women and the Women's Caucus for Political Science. $1.00.

ROSTER OF WOMEN IN POLITICAL SCIENCE (4th edition)

Biographical information on women political scientists. $3.00 each.

ANNUAL APSA DIRECTORY OF DEPARTMENT CHAIRPERSONS

Names and addresses of Chairpersons of departments offering political science at four-year institutions. $20.00 each.

PERSONNEL SERVICE GUIDELINES FOR EMPLOYERS AND APPLICANTS

Pamphlet containing information and guidelines for members of the APSA Personnel Service and for employers listing their vacancies in the Personnel Service Newsletter. No charge.

PERSONNEL SERVICE NEWSLETTER

Monthly listing of positions for political scientists. APSA Members: $8.00 subscription.

**Order from: Customer Service Department, University Microfilms, 313 North First Street, Ann Arbor, Michigan 48106.

CAREERS AND THE STUDY OF POLITICAL SCIENCE: A GUIDE FOR UNDERGRADUATES

A monograph discussing the relationship between political science knowledge and skills and careers in law, government, business, journalism, teaching, etc. $.50 each; bulk rates available.

GUIDE TO GRADUATE STUDY IN POLITICAL SCIENCE

Compilation of Ph.D. and Masters programs in political science. The 1976 Guide is revised and expanded to include listings of faculty and fields of specialization. $4.00 each.

SOURCES OF FINANCIAL SUPPORT FOR POLITICAL SCIENTISTS: RESEARCH EDUCATION, PROFESSIONAL DEVELOPMENT BULLETIN 1: SUPPORT FOR PROFESSIONAL DEVELOPMENT: FELLOWSHIPS AND TRAINEESHIPS

Information on post-doctoral fellowships, internship programs, special training support and foreign travel grants available to faculty and advanced graduate students. $1.00 each.

GLOBAL DIMENSIONS IN U.S. EDUCATION

A joint publication of the APSA Committee on Pre-Collegiate Education, the Education Commission of the International Studies Association, and the Center for War/Peace Studies of the N.Y. Friends Group, Inc. Four publications: The Elementary School, The Secondary School, The University, The Community. $1.50 each, $5.00 per set.

COMPARING POLITICAL EXPERIENCES

Complete description of an alternative course for high school government instruction. $2.75 each.

SETUPS: AMERICAN POLITICS

Supplementary Empirical Teaching Units in Political Science

New computer related instructional materials whereby students learn important substantive topics in American politics as they learn methods of analysis. *Voting Behavior: The 1972 Election* by Bruce D. Bowen, C. Anthony Broh, Charles L. Prysby. *Political Socialization Across the Generations* by Paul Allen Beck, Jere W. Bruner, L. Douglas Dobson. *Political Participation* by F. Christopher Arterton, Harlan Hahn. *Representation in the United States Congress: 1973* by Ray A. Geigle, Peter G. Hartjens. *The Supreme Court in American Politics: Policy Through Law* by John Paul Ryan, C. Neal Tate. *U.S. Energy, Environment and Economic Problems: A Public Policy Simulation* by Barry Hughes. *The Dynamics of Political Budgeting: A Public Policy Simulation* by Marvin K. Hoffman. CHE'S GUERRILLA WAR
Regis Debray
Translated by
Rosemary Sheed

One of the most important books to come out of Latin America in decades. Debray, the well-known French radical, who was with Che Guevara in Bolivia, analyzes the failure of Che's revolutionary struggle and ponders its message for future revolutionaries.
(A1884) $2.50

THE ORIGINS OF MODERN LEFTISM
Richard Gombin
Translated by
Michael K. Perl

An unbiased look at the New Left — a growing international movement that aims to occupy the vacuum created by the failure of official communism. The coherent exposition of a radical alternative to Marxism/Leninism. (A1846) $2.95

HOW CONSERVATIVES THINK
Edited by Philip W. Buck

Writings by outstanding British conservatives from the seventeenth century to the present provide an essential background to understanding conservatism today. Contributors range from Edmund Burke to Robert Peel, Benjamin Disraeli to Winston Churchill. (A1885) $3.25

MEDIEVAL POLITICAL THOUGHT
Walter Ullmann

Previously published in Pelican books as *A History of Political Thought: The Middle Ages*. A survey of the origins and development of political ideas in Western Europe between the fifth and twelfth centuries.
(Y102) $4.95

RESIGNATION IN PROTEST:
Political and Ethical Choices Between Loyalty to Team and Loyalty to Conscience in American Public Life
Edward Weisband and Thomas M. Franck

An original examination of the behavior of senior government officials when they are in disagreement with administration policies.
(C615) $2.95

THE MAN ON HORSEBACK:
The Role of the Military in Politics
S. E. Finer

The definitive book on the military in politics. "The writer's discussion of the motives and situations which precipitate military intervention is as thorough as his examination of the historical reasons."
—*Spectator*
(Y106) $5.95

THE LEFT IN BRITAIN: 1956-1968
David Widgery

The fortunes of the British left — from the Soviet intervention in Hungary to the student riots in Paris. Referring to contemporary sources, Widgery shows how working-class groups have combined with middle-class writers to transform what it means to be "on the left."
(Y99) $7.95

Timely Books for a Bicentennial Election

POWER AND THE PRESIDENCY

Edited by Philip C. Dolce & George H. Skau

Originally part of a CBS-TV series entitled, "The American Presidency: The Men and the Office," these provocative essays represent the divergent views of leading historians, journalists and political scientists. In 26 essays, the experts analyze specific administrations from George Washington to Richard Nixon and explain why the Presidency of the United States is the most powerful office in the world.

PRICES, PROFIT, AND PRODUCTION
How Much is Enough?

J. William Leasure and Marjorie Shepherd Turner

As the United States enters the mid 1970s, it suffers from spiraling inflation, chronically high unemployment, and serious shortages of fuel and consumer products. Yet, while consumers and wage earners tighten their belts, many companies report record profits.

Prices, Profit, and Production offers a practical cure for these economic ills: the Profit Stabilization Principle, which would tie industry profits and prices together so that prices could not rise unless a company's profits dropped below an acceptable level. To explain their plan, the authors introduce the ideas of Friedman, Galbraith, and others and explain complex economic concepts in a clear and understandable manner. A valuable book for students of public policy, American politics, and contemporary economic problems. *$3.50 paper*

CONTINUUM BOOKS

In his brilliant new work, THE DIALECTIC OF IDEOLOGY AND TECHNOLOGY, Gouldner relates both ideology and sociology to the revolution in printing technology and the emergence of bourgeois society. Pointing to the importance of ideology for the bourgeois class system, he emphasizes its "renaissance" in today's consumerism and the resulting crisis for capitalism.

Grounded in both classical American sociology and neo-Marxist critical theory, Professor Gouldner's work combines a remarkable empirical sweep with a lucid analysis of connections between these theoretical traditions. Throughout, he moves toward the formulation of a modern politics centered on new techniques of communication.

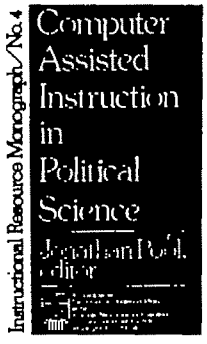
INSTRUCTIONAL RESOURCE MONOGRAPHS



Information and evaluation for teachers, librarians, and students on U.S. government publications, general reference books, library facilities, and their utilization.

As a guide to the development of an alternative (to lecture and discussion sections) method of teaching and learning, this monograph is a collection of essays on the objectives, organization and impact of using the personalized system of instruction in political science. Examples are given on topics in American politics.

A selective guide to the development, applicability and impact of simulations and games, with examples for the design of original role playing exercises.

A guide to the theory, design and application of computer-assisted instruction for interactive teaching and learning in political science. Examples from several subfields, including political philosophy.

Washington, D.C. 20036

THE AMERICAN POLITICAL SCIENCE ASSOCIATION

PERSONNEL SERVICE

The American Political Science Association's Personnel Service operates as a clearinghouse, bringing together political scientists seeking positions and prospective employers. Registration in the service is open to members of the Association and to Political Science Departments. Membership in the Service, which includes a subscription to the monthly Newsletter, is $8.00 per year. Membership in the Credential Referral Service of the Personnel Service is an additional $8.00.

NEWSLETTER

A Newsletter, listing openings for political scientists including teaching, administrative and research openings, is mailed monthly to all Personnel Service members. Positions are listed by institution with a brief description of each opening.

CREDENTIAL REFERRAL SERVICE

A file will be maintained at the Association office for all members of the Credential Referral Service. This file will include a resume, a dissertation abstract and/or a list of publications, and up to three letters of reference for each member. Referrals are made upon the request of a member or of an institution.

EMPLOYERS USING THE SERVICE

The Association's Council has adopted a policy that it is a professional obligation of all political science departments to list publicly all vacancies in the APSA Personnel Service Newsletter for which they are recruiting at the Instructor, Assistant and Associate Professor levels. In addition, the listing of openings at the Full Professor level is strongly encouraged. There is no cost to the institution listing its vacancies with the Service. Forms for listing openings in the Newsletter are available from the Personnel Service.

For further information concerning the Personnel Service, write to:

Director, Personnel Service
The American Political Science Association
1527 New Hampshire Avenue, N.W.
Washington, D.C. 20036

The International Political Science Association
Invitation to Membership-1976

The International Political Science Association welcomes political scientists as members. The Association, founded in 1949, is composed of three categories of members: individuals, institutions, and national associations.

Membership in the Association of $6.00 a year entitles members to receive the Newsletter giving information about IPSA activities and meetings; to purchase material published under IPSA auspices — including the *International Bibliography of Political Science,* published annually by Stevens in London and sets of papers submitted at IPSA meetings at reduced cost; and to register at IPSA meetings at lower rates.

Individual members are entitled also to receive at lower rates either the *International Political Science Abstracts* published bi-monthly by the Association itself or the *International Social Science Journal,* the quarterly organ of the Department of Social Sciences of UNESCO. To join the Association send your name and check to the International Political Science Association, General Secretariat, 43 rue des Champs Elysées, B-1050, Bruxelles, Belgium.

Popular entertainment or propaganda?

FILMS AND THE SECOND WORLD WAR
by Roger Manvell

A richly illustrated examination of the way in which the world's filmmakers have represented the Second World War on the screen. Under the guise of popular entertainment, these films were used to incite nations and individuals to fight, and thus became essential weapons during the war. In the postwar period, films were used to explain —or explain away—the issues involved after new political alignments had been made. Beyond the complex story of screen propaganda, the author shows how much is to be learned about the motivations of war as they have developed during the twentieth century.

"Offers not only a story of the use of film as propaganda and later as historical interpreter, but...provides a parallel between what actually was happening in the world during the years covered and how that was presented on film. A valuable addition to the library of the serious film student, the film buff, and the history buff."—*New Vistas*
Heavily illustrated with film clips.

A DELTA BOOK $4.95

Just published—

RUSSIA ON OUR MINDS
Delia and Ferdinand Kuhn

RECENT BOOKS FROM HARPER & ROW

THE 103RD BALLOT
The Incredible Story of the Disastrous Democratic Convention of 1924
By Robert K. Murray. The year was 1924 and the Democrats, leaderless and divided, seemed headed for a catastrophe as their convention went to three bruising weeks and 103 ballots. "An exciting reconstruction of one of the most dramatic episodes in American political history."
—*Theodore H. White.* Illustrated, $10.95

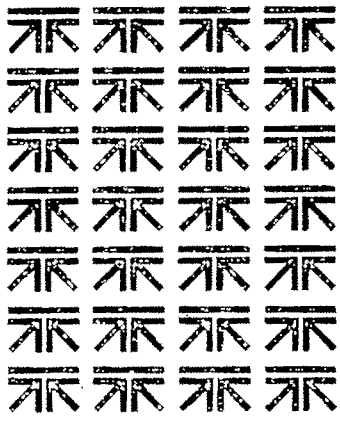
LYNDON JOHNSON AND THE AMERICAN DREAM
By Doris Kearns. "Nothing else written about Lyndon Johnson so brilliantly illuminates his personality or so objectively assesses his frustrations and achievements. This is the indispensable book about Johnson and his presidency."—*Arthur Schlesinger, Jr.* $12.50

THE TRANSFORMATION OF AMERICAN FOREIGN RELATIONS, 1865-1900
By Charles S. Campbell. "A detached, closely researched diplomatic and political history of the post-Civil War efforts to establish the U.S. as an overseas power."
—*Kirkus Reviews.* The New American Nation Series. Illustrated, $15.00

THE PAST MASTERS
Politics and Politicians 1906-1939
By Harold Macmillan. In this lively and informative book, the former Prime Minister recalls the giants of the generation before his own, his sometimes mentors and colleagues, Lloyd George, Ramsay MacDonald, Baldwin, Chamberlain and Churchill. Illustrated, $15.00

THE JOURNALS OF DAVID E. LILIENTHAL
Volume VI—Creativity and Conflict, 1964-1967
In this self-portrait, Lilienthal is revealed as a man of extraordinary optimism and energy, moving through the tumultuous and often tragic events of the mid-1960s. "One of the great journals of our time."—*Jonathan Daniels.* Illustrated, $20.00

THE BRIBE
By Philip Ross. When the young, Democratic mayor of Fort Lee, New Jersey, is offered half a million dollars to influence a zoning ordinance, his refusal to cooperate leads to a suspenseful true story of FBI stakeouts, mob entrapment and conviction. "Fast paced ... compelling ... startling."—*Jack Anderson* $8.95



THE MURDER OF ALLENDE
And The End of the Chilean Way to Socialism
By Robinson Rojas Sandford. A leading Chilean journalist who lived through his country's bloody, right-wing coup now reveals startling details of the military, industrial and commercial conspiracy—abetted by North American interests—to bring down the Allende government. $10.95

OLD FACES OF 1976
By Richard Reeves. Revealing, perceptive views of Jerry Ford, Nelson Rockefeller, Teddy Kennedy, George Wallace, Hubert Humphrey, Ronald Reagan, Jimmy Carter, Ed Muskie, Scoop Jackson, George McGovern, Hugh Carey, Abe Beame, Jack Javits, Jerry Brown and other figures in today's political arena. "Dick Reeves is one of the best political reporters in the country."—*Edwin Newman, NBC News* $10.00

Melman, Seymour
THE PERMANENT WAR ECONOMY
American Capitalism in Decline

"Melman examines such areas as the decline of industrial efficiency, trade-offs between social and military programs, and the conversion of defense industries to peaceful uses . . . his discussion of the conversion of defense industries should be of wide interest. . . . Recommended for economics and political science collections."—*Library Journal.* "This book . . . is important because it deals with a most important question."—*Choice.* "The time may finally be right for these sensible ideas!"—*New York Times Book Review.*
☐ 22261 Index $4.95

Redman, Eric
THE DANCE OF LEGISLATION
Foreword by Richard E. Neustadt

The book traces the drafting and passing of a piece of legislation—the National Health Service Corps Act—with all the maneuvers, plots, counterplots, alarums, frustrations, triumphs and sheer work and dedication involved. "An outstanding book for undergraduates interested in politics. . . . There have been many case studies written to illuminate the legislative process . . . but Redman's effort is distinctive . . . the book may stimulate some young readers into considering seriously a career in politics."—*Choice.* ". . . a unique and innovative study. . . . A fascinating account of the day-to-day strategy of lawmaking."—*Library Journal.* "Few writers have actually produced a book that has such a useful blend of information, self-deprecatory humor, and keen rendering of the distinctive atmosphere of Congress." —William V. Shannon, *The New York Times Book Review.*
☐ 21746 $3.95

Thayer, George
WHO SHAKES THE MONEY TREE?
American Campaign Financing Practices from 1789 to the Present

Examining the ways in which American political campaigns are financed, Thayer goes beyond the visible shoots of the money tree to trace the roots that reach far down into every aspect of American life. "An enormously entertaining and wise treatise."—Robert Sherrill, *Chicago Tribune.* "The extraordinary number of illustrations makes very interesting reading. . . . The book is well indexed."—*Choice.* "Thayer offers many good perceptive observations . . ."—*Library Journal*
☐ 21913 Index $2.95

Barnet, Richard J. and Ronald E. Müller
GLOBAL REACH
The Power of the Multinational Corporations

"Based on a synthesis of recent analytical studies, this work presents a cool-headed appraisal of the significance of multinational firms for all of human existence. . . . An outstanding treatment that combines readability with careful analysis."—*Library Journal.* "Interesting in presentation no less than important in substance."—Leon H. Keyserling, Former Chairman of the Council of Economic Advisors and President of the Conference on Economic Progress. "An impressive amount of quantitative, qualitative, and anecdotal information on the multinationals . . ."—Thomas Horst, *Harvard Magazine.* "Rewarding, readable, and provocative."—*Business Week.* "A superb book that demands to be read."—*The New York Times.*

☐ 20576 Biblio., Index $1.95

READ THE SOVIET MIND

Adam Ulam displays his extraordinary ability to penetrate the core of the Soviet mind as he examines 100 years of Russian revolutionary thought and the men who shaped it.

Writing with keen insight and uncommon sense, he shows the continuity of thought that stretches from Herzen to Trotsky, Stalin, Khrushchev, and, finally, Solzhenitsyn.

Politics in France

Third Edition

Henry W. Ehrmann

Since 1971, when the Second Edition of this leading study of politics in France appeared, that country has gone through one national referendum, one parliamentary election, one presidential election, and a rather drastic restructuring of its party system. This new Third Edition will help students understand these important events in both their new and old contexts.

Professor Ehrmann was also prompted to write this revision by the continuing, impressive output of studies on modern French politics. Ehrmann critically reviews the most important discussions and indicates major areas that remain open for further investigation.

Paper approx. 384 pages
August 1976 $5.95 tent.

Cases in Comparative Politics

Third Edition

James B. Christoph
Indiana University
Bernard E. Brown
City University of New York

Extensively revised and updated, this new Third Edition of CASES IN COMPARATIVE POLITICS features eight case studies—two each on Britain, France, Germany, and the U.S.S.R.—that examine foreign and domestic policy-making in those countries. All of the cases were written by specialists expressly for this volume. New cases on university reform in France, codetermination in West Germany, and Ostpolitik have been added to this edition, and important new material has been incorporated into all the other cases. An introductory section deals with the case method in comparative politics and the concept of decision-making.

Paper approx. 368 pages
August 1976 $6.95 tent.

Coming later this Fall . . .

Power and Interdependence

World Politics in Transition

Robert O. Keohane
Stanford University
Joseph S. Nye
Harvard University

Transnational politics—a contemporary theoretical approach to world politics, applied to four historically-extensive case studies.

Cloth approx. 300 pages
November 1976 $12.95 tent.
Also available in paperback: $5.95 tent.

Felony Justice

An Organizational Analysis of Criminal Courts

James Eisenstein
Pennsylvania State University
Herbert Jacob
Northwestern University

A comparative analysis of felony dispositions in Chicago, Detroit, and Baltimore.

Cloth approx. 280 pages
November 1976 $12.95 tent.
Also available in paperback: $5.95 tent.

Other Recent Publications . . .

The Basics of American Politics

Gary Wasserman
Medgar Evers College, CUNY
with Ed Beard and Marsha Hurst

A new, brief and inexpensive introductory text. Simply and straightforwardly, this lean volume deals with the most elemental structures and functions of American government. The theme of politics as a game unifies the book and focuses attention on the dynamic competition for power and values. Emphasis is placed on the effects of, and our constant involvement in, politics.
Paper 239 pages
1976 $4.95

American Government

Readings and Cases
Fifth Edition

Peter Woll
Brandeis University

AMERICAN GOVERNMENT—now available in an updated Fifth Edition—focuses on issues that are central to an understanding of the governmental process. The new edition provides the same excellent coverage of Constitutional cases and historical and analytical background materials as the earlier editions. But 40% of the readings in this edition are new; they deal with contemporary problems and the stresses that have been placed on the political system in the 1970s. A new Instructor's Manual is also available.
Paper 581 pages
1975 $6.95

U.S. Foreign Policy and World Order

James A. Nathan
James K. Oliver
Both at the University of Delaware

Nathan and Oliver's outstanding new foreign policy text offers: (1) a detailed, comprehensive overview of U.S. foreign policy since World War II; (2) a systematic, unifying theme: the evolution of military force and the threat of force as the primary instrumentality of American foreign policy; (3) a synthesis of the political-strategic and economic elements of U.S. foreign policy; and (4) an integrated analysis of foreign policy and domestic institutions.
Paper 608 pages
1976 $10.95

Politics in the American States

A Comparative Analysis
Third Edition

Herbert Jacob
Northwestern University
Kenneth N. Vines
SUNY, Buffalo

The leading text in the field of state politics has been substantially revised and rewritten for its new Third Edition. It features a new chapter on the regulation of the environment, a new chapter on Federalism, five new authors (all chapters are either new or rewritten), and a greater emphasis on lucid explanation rather than statistical analysis.
Cloth 528 pages
1976 $12.95

Political Change in the Metropolis

John J. Harrigan
Hamline University

POLITICAL CHANGE IN THE METROPOLIS is a new text that integrates coverage of central-city, suburban, and metropolitan-level politics, as well as the politics of Federal involvement in urban affairs. One major analytical theme—the bias of political change—draws the author's material into a coherent and logical argument. Thorough coverage of machine politics, ethnic politics, the political reform movement, and community control is provided.

Announcing
the Outstanding Candidate in '76

the new Third Edition of

DEMOCRACY UNDER PRESSURE
An Introduction to the American Political System

MILTON C. CUMMINGS, JR., The Johns Hopkins University
DAVID WISE

...the best-selling introduction to American government, acclaimed in its previous edition as "The most current, topical, and provocative introductory textbook of its kind."* *Democrarcy Under Pressure* offers a critical yet balanced examination of the processes and structures of the American political system written in a style that is at once scholarly, highly readable, and thought-provoking. And this new Third Edition—as current, topical, and provocative as its predecessors—analyzes such recent developments in American politics as:

- the 1976 presidential primaries, nominating conventions, and election
- election reforms and the workings of the new Federal Election Commission
- abuses of power by federal intelligence agencies; the Church and Pike committee investigations; the new Senate oversight committee and its proposed legislative reforms.
- the impact of the Burger Court on civil rights and civil liberties
- multinational corporations and their growing influence both at home and abroad
- our growing awareness of the limitations of governmental solutions to national problems
- our understanding of the restraints on American power throughout the world
- the issues raised by our energy needs vs. ecological stability

Publication: *Spring 1977*

*William J. Jervey, Florida Technological University

Essential Books on the

UNITED STATES V. NIXON
The President Before the Supreme Court
Edited by Professor Leon Friedman, *Hofstra Law School*

Published in association with Chelsea House Publishers

"An invaluable volume to all students of American government."—from the review in *Choice,* which selected it as one of the "outstanding academic books of 1975."

Here, in their entirety, are the eleven actual briefs, decisions, and verbatim transcripts of oral testimony which triggered the resignation of Nixon. Professor Alan F. Westin contributes an introductory essay.

ISBN 0-8352-0802-8. LC 74-16403. CIP. 1975. 619 pages. $15.00.

THE GROWTH OF PRESIDENTIAL POWER
A Documented History
By Professor William M. Goldsmith, *Brandeis University*

Published in association with Chelsea House Publishers

"Here Goldsmith has presented a sweep of scholarly literature that will be difficult to match and improbable to surpass in the near future... a classic work."—from the review in *Choice,* which selected it as one of the "outstanding academic books of 1975."

The uniqueness of the presidential office requires a reference work that elucidates as it documents and analyzes as it narrates. This study of the evolution of presidential power documents the expansion and contraction of the office, the struggles with Congress, the courts, and public opinion. The scope ranges from the office's political antecedents through Watergate.

ISBN 0-8352-0778-1. LC 74-9623. CIP. 1975. 2,342 pages.
$96.50 the 3-vol. set.

ALL ABOUT POLITICS
Questions and Answers on the U.S. Political Process
By Paul A. Theis and William P. Steponkus

"Non-partisan... lively and informative."—American Reference Books Annual

Two political pros ask and then answer 400 of the most revealing questions pertaining to every area of the complex world of American politics. The questions span regional and ethnic voting biases, the utilization of volunteers, and the origins of the "Eastern Establishment." Illustrated.

ISBN 0-8352-0528-2. LC 72-8470. 1972. CIP. 228 pages. $12.95.

PUBLIC OPINION
Changing Attitudes on Contemporary Political and Social Issues
(A CBS News Reference Book)
By Robert Chandler

"A most interesting book."—RQ

Tabulates and analyzes the results of nine exhaustive polls taken during the late 1960's by CBS News: The Bill of Rights, Black and White Attitudes, Women's Liberation, The Generation Gap, Marijuana, President Watching, Political Polling, The War in Vietnam, The Environment.

ISBN 0-8352-0548-7. LC 72-1739. CIP. 1972. 195 pages. $12.95.

American Political Process

"These two volumes will stand as models for the valuable preservation of source documents, evidence, testimony."—Doris Grumbach, *The New Republic*

WAR, FOREIGN AFFAIRS AND CONSTITUTIONAL POWER
Abraham D. Sofaer, Columbia University School of Law
Recent presidential initiatives and assertions of power in foreign affairs led the American Bar Association to fund a comprehensive study of the allocation of such power within the branches of American Government. This first volume of the study analyzes the Constitution, its background, and the process by which it was drafted and ratified; it then continues through the first forty years of history under the present constitution.
Available $15.00

PRISON REFORM AND STATE ELITES
Richard A. Berk, Northwestern University and Peter H. Rossi, University of Massachusetts
Clear-cut strategies for implementing prison reform —this comparison of prison reform efforts identifies the characteristics of decision-making 'elites' and how to locate within these elites support for reform as well as opponents of change.
In preparation ca $15.00

THE POLITICS OF INTERNATIONAL MONETARY REFORM: The Exchange Crisis
Michael J. Brenner, Boston University
This review of negotiations leading to fundamental revisions in the international monetary systems—particularly flexible exchange rates—is an important guide to the intricate and vital issues of international economic life and the politics of collective decision-making.
Available $13.50

NUCLEAR PROLIFERATION AND THE NEAR-NUCLEAR COUNTRIES
Edited by Onkar Marwah and Ann Schulz, Clark University
Issues in the nuclear strategic debate that divide first and second order states; the process of proliferation and its consequences for the international political system.
Available $16.50

THE NEW URBAN POLITICS
Edited by Louis H. Masotti and Robert L. Lineberry, Center for Urban Affairs, Northwestern University
These original essays by urban scholars present new perspectives on urban politics and issues—includes discussions of emerging issues and actors and reformulations of traditional issues.
Available $14.00

FEAR IN THE COUNTRYSIDE: The Control of Agricultural Resources in the Poor Countries by Non-Peasant Elites
E. G. Vallienatos, Center for Populations Studies, Harvard University
A challenging analysis of world food problems and the adverse impact of 'Green Revolution' strategies on social change—suggests new policies geared to encouraging social change—the transfer of 'appropriate' technologies and the strengthening of the role of the small farmer throughout the world.
Available $14.00

THE POLITICS OF HIGHER EDUCATION AND PUBLIC POLICY: A Study of the American Council on Education
Donald M. Stewart, The University of Pennsylvania
An indepth study of the higher education sector in this country — its values and decision processes, its involvement and influence in government and conversely, its responsiveness to government policies —an informative guide to the politics of interest groups.
In preparation $15.00 (est.)

A COMPARATIVE ATLAS OF AMERICA'S GREAT CITIES
Twenty Metropolitan Regions
Edited by Ronald Abler, The Pennsylvania State University; John S. Adams, University of Minnesota and Ronald Abler, Text; Ki-Suk Lee, Chief Cartographer
Published by the University of Minnesota Press, this comprehensive atlas offers a wealth of information derived and interpreted from the findings of the 1970 U.S. census. *(Available from the University of Minnesota Press, 2037 University Avenue Southwest, Minneapolis, MN 55455.)*

COMPARATIVE METROPOLITAN ANALYSIS PROJECT
The University of Minnesota Press and Ballinger Publishing Company are pleased to announce the publication of a series of distinguished books prepared by the Comparative Metropolitan Analysis Project. Sponsored by the Association of American Geographers and funded by the National Science Foundation, this four-year research and writing effort has produced new and critically important conceptual approaches to understanding the issues that confront American Cities.

URBAN POLICY-MAKING AND METROPOLITAN DYNAMICS
A Comparative Geographical Analysis
Edited by John S. Adams, University of Minnesota
A comparison and evaluation of the progress made in urban policy during the Sixties throughout the country's major metropolitan areas.
Available $25.00

Twenty Geographical Vignettes
Edited by John S. Adams, University of Minnesota
Skillfully-drawn portraits of America's twenty largest cities prepared by local geographers who blend first-hand knowledge with empirical data compiled by the Comparative Metropolitan Analysis Project.
December Four Volumes $60.00 (the set)

POLICING A FREE SOCIETY
Herman Goldstein, University of Wisconsin Law School
The quality of policing has a very direct effect on the quality of life in a democracy, but the American public persists in its neglect of complex, yet remediable problems that thwart the most determined efforts to achieve a high level of policing. Drawing upon his unique blend of experience, Herman Goldstein has provided the integrated framework that is essential to understanding and attacking these problems—and relating them to the goal of improving the quality of service provided the citizenry.
Available ca. $15.00

THE AMERICAN POLITICAL SCIENCE ASSOCIATION AND THE

UNIVERSITY CENTER FOR INTERNATIONAL STUDIES

ANNOUNCE

A New Annual Reference Publication

UNITED STATES POLITICAL SCIENCE DOCUMENTS

United States Political Science Documents (USPSD) is the published version of a computer-based file of political science information being developed continually by the University Center for International Studies, University of Pittsburgh, in conjunction with the American Political Science Association.

Over the past ten years the political, social, and policy sciences have been inundated with an increasing flow of journal information. Not until now has a convenient sorting, filing, and evaluation process been developed to enable the academic community to keep up with the masses of information in a timely manner. This is why *USPSD* was created.

Volume I of *USPSD* will include between 2,000 and 2,500 documents published during 1975. The set will be available from UCIS Publications during the summer of 1976. For further information or to place your order, write to UCIS Publications at the address below.

USPSD will enable you conveniently to keep abreast of all the major journals in the field of political, social, and policy science, such as:

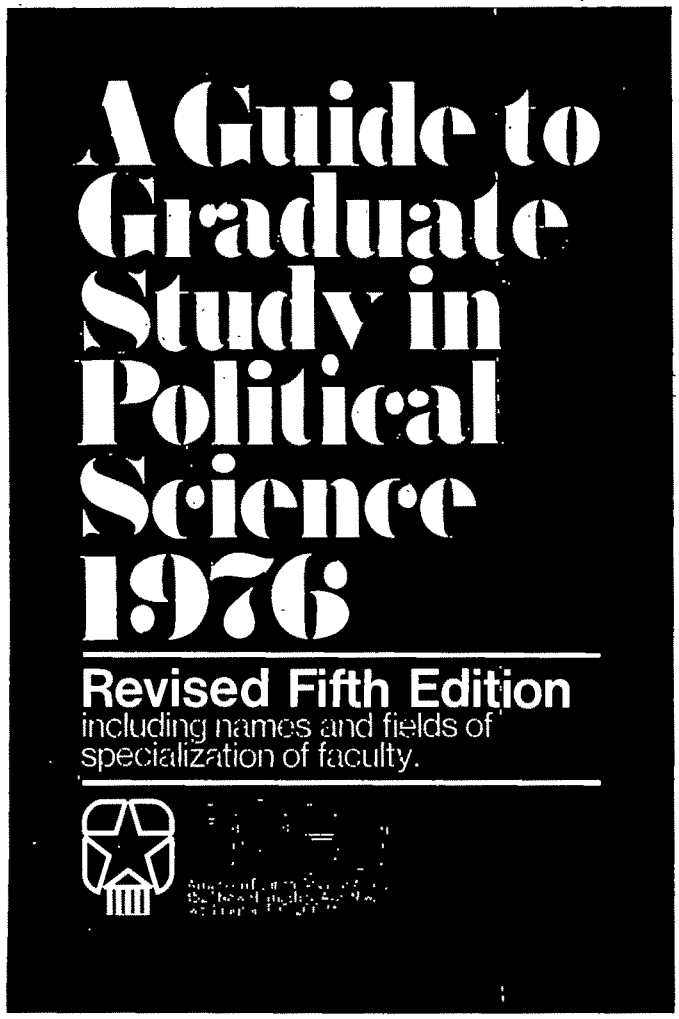
American Political Science Review
Comparative Political Studies
Comparative Politics
Economic Development and Cultural Change
Foreign Affairs
Foreign Policy
International and Intercultural Communication Annual
International Development Review
International Education and Cultural Change
International Interaction
International Organization
International Relations
International Studies Quarterly
Journal of Conflict Resolution
Journal of International Affairs
Policy Analysis
Policy Studies Journal
Studies in Comparative Communism
Studies in Comparative International Development
World Affairs
World Politics

USPSD will be an annual reference publication which examines and analyzes every article in over 120 major political, social and policy science journals.

Each entry in *USPSD* provides:

1. Author;
2. Title;
3. Journal Source and pagination;
4. An Abstract that describes the scope, purpose, methods employed, and results obtained in each article;
5. A listing of Special Features that include titles of all tables, graphs, figures, and maps used in each article;
6. A listing of Authors Cited in footnotes or references;
7. A listing of Key Subject Descriptors attributed to each article;
8. A listing of the major Geographic Areas referred to in each article;
9. A listing of Proper Names of organizations, political institutions, laws, etc. mentioned in each article.

USPSD will be published annually in TWO PARTS. The abstracts of the journal articles will comprise PART II and include those items listed above. PART I consists of five indexes to all the articles abstracted in Part II; they are divided according to:



1. Author(s) of each article;
2. Descriptor Subjects that are attributed to each article (The descriptions are taken from over 3,000 terms listed in the Political Science Thesaurus);
3. Geographic Areas referred to in each article;
4. Proper Names of organizations, political institutions, laws, etc. mentioned in each article;
5. Journal in which each article is published.

USPSD can be purchased as a two volume set—PARTS I & II—or PART I, the indexes, can be purchased separately. Prices for both are as follows:

	Regular price	APSA-member price
PARTS I & II (Index & documents)	$90.00	$75.00
PART I (Index only)	$75.00	$60.00

How to win revolutions and influence politics.

J. Bowyer Bell walked down Murder Mile in Aden, was fired upon in Northern Ireland, and interviewed governors, guerrillas, arms smugglers, mercenaries, and Mau Mau to write this book.

It is an intense, and intensive, examination of the strategies of the revolts that erupted across the British Empire between 1944 and 1974. Bell describes in vivid detail the strategy, tactics, responses, and final outcome of each revolt – from Israel to the Gold Coast, from Malaya to Kenya.

George Quester called *On Revolt*, "Immensely readable, exhaustively researched in the field and in the literature, conveying a great deal of detail I have not seen in print before."

Coming in November from New Viewpoints

THE UNITED STATES AND THE DEVELOPMENT OF SOUTH AMERICA 1945-1975
By Samuel L. Bally, Rutgers University
Calling for a major re-evaluation of our policy, Dr. Bally effectively challenges some of the most widely held conventional views of U.S.-South American relations, including those that have prevailed in the State Department. He argues convincingly that many of the problems between the two continents are caused not by neglect, but by the effective implementation of policy, suggesting that the interests of the U.S. and South America are not necessarily compatible. Tables. Bibliography.

Hardcover 531-05387-3 $15.00
Paperbound 531-05594-9 $ 6.95

HARRY TRUMAN'S CHINA POLICY: McCarthyism and the Diplomacy of Hysteria, 1947-1951
By Lewis McCarroll Purifoy, Emory and Henry College
In policy statements of January, 1950, the Administration solemnly affirmed that it would not engage in land wars in Asia. Why then, later in the same year, did America lunge desperately at the Asian continent? The author believes it was the frenzied McCarthyite attacks on the government for its alleged softness on Communism—and only this—that brought about the reversal of America's policy of nonintervention. Purifoy's book is a superb study of how not to conduct foreign policy.

PUBLICATIONS OF THE CONSORTIUM FOR COMPARATIVE LEGISLATIVE STUDIES

Malcolm E. Jewell, General Editor

INFLUENCE IN PARLIAMENT: CANADA
Allan Kornberg and William Mishler

Probably the most ambitious and successful study undertaken of a single parliamentary body, this book adds significantly to existing knowledge about the Canadian Parliament and makes important contributions to the comparative study of legislative systems and behavior.
Summer 1976
$14.75

LEGISLATIVE AND POLITICAL DEVELOPMENT
Lebanon, 1842–1972
Abdo I. Baaklini

"Abdo Baaklini's seminal work on the Lebanese Parliament could be taken as a model for the proliferation of legislative case studies which is critically needed in legislative research. Making use of a variety of methods and drawing on attitudinal and behavioral data, Baaklini adroitly sets the Lebanese Parliament into its historical and political setting." Alan P. Balutis, POLITY
Summer 1976
$11.50

LEGISLATIVE SYSTEMS IN DEVELOPING COUNTRIES
G.R.Boynton and Chong Lim Kim, editors

Focuses on countries in Asia, Africa, and Latin America and on the role played by the legislatures of the countries discussed. The essays challenge traditional assumptions about legislatures and relate legislatures to broader political systems and problems of political development.
1975
$11.75

Change and Continuity in American Politics

The Social Bases of Political Parties
David Knoke
Using the Survey Research Center's data on presidential elections from 1952-1972, Knoke provides the most penetrating recent analysis of the social bases for party political support in the United States. He constructs a causal model to show how religion, race, region, and socioeconomic status affect identification with a particular party. $11.50

Japan Faces China

Political and Economic Relations in the Postwar Era
Chae-Jin Lee
Utilizing information collected from indigenous published materials and personal interviews, as well as quantitative data from trade statistics, opinion polls, election results, and voting records, Chae-Jin Lee analyzes the complex of factors that influenced Sino-Japanese relations from 1949 through 1972. He shows in particular how Japan's ruling Liberal-Democratic Party, opposition Japan Socialist Party, and other political groups fluctuated in their policies toward China and also examines the influence exerted on the Japanese government by business and labor interests. $12.50

Comparative Human Rights

edited by Richard P. Claude
"This extraordinarily insightful study seeks to bring the methods and findings of comparative study and policy science to bear upon the increasingly important problem of human rights. It deserves the attention of all who are concerned with clarifying and implementing a law of human dignity." — *Myres S. McDougal, Sterling Professor of Law, Emeritus, Yale University*
$16.50

Southern Politics and the Second Reconstruction

Numan V. Bartley and Hugh D. Graham
"A work of exhaustive research and mature judgments, based largely on analyses of both voting and survey research data but also on interviews and more traditional historical sources, SOUTHERN POLITICS AND THE SECOND RECONSTRUCTION is very likely the most engrossing and important statement on recent southern politics yet in print. Clearly written and jargon-free, copiously illustrated with readable tables, maps, and graphs, it has bottom-of-the-page documentation, an extended bibliographic essay, and a note on methodology lucid enough to be understood even by nonquantifiers." — *Journal of Southern History* $3.65 paperback, $12.50 hardcover

Congressional Procedures and the Policy Process

by Walter J. Oleszek

A study of the legislative process in Congress. The organization, rules, procedures and folkways of the House of Representatives and Senate are examined from the perspective of how ideas are transformed into public laws. Intended to provide a clear understanding of how and why the contemporary Congress functions as it does, the study discusses the political and institutional environment of senators and representatives, the formulation of legislation, processing of legislation by committees, scheduling of bills and floor consideration, resolution of differences between the houses, and Congress' oversight role. Special emphasis is placed on the influence the organization and procedures of Congress have on strategies for enacting or blocking legislation, bargaining between members and, ultimately, the shape of public policy. In response to a number of factors, Congress' organization and processes have changed significantly in recent years. Both chambers have instituted procedures to open legislative proceedings to more public view; to strengthen oversight capabilities; to improve the budgetmaking process; to modify the seniority system and to enhance the role of party caucuses. These and other new developments are carefully assessed. February 1977. Approx. 225 pages. $4.50

Financing Politics: Money, Elections and Political Reform

by Herbert E. Alexander

A thorough analysis of an issue that goes to the basic fibers of our democratic system—the financing of electoral politics. The book discusses how money is raised, handled, spent and regulated in American elections. The history of the increasing costs of political campaigns is documented. The author considers the perennial question of whether big spending is the way to political success, showing where and how money has been a deciding factor and where—surprisingly—it has not. Campaign finance reform is examined as a case study of political reform—with analyses of the effects of major election reform legislation in 1971, 1974 and 1976. The record of campaign finance in the 1972 and 1976 presidential elections, including the campaign abuses associated with the Watergate affair and the successes and failures of the Federal Election Commission, provide a backdrop for an overview of money in politics and election reform.

October 1976. Approx. 225 pages. $4.50

PRINCIPLES OF AMERICAN GOVERNMENT

SECOND EDITION

The Second Edition of PRINCIPLES OF AMERICAN GOVERNMENT, the shortened paperback version of the authors' AN INTRODUCTION TO AMERICAN GOVERNMENT has undergone thorough revision. Chapters on political parties and elections, congress, and the presidency have been extensively rewritten and updated to incorporate key developments through the 1976 elections. The new edition also reflects the changes heralded in last year's revision of the longer text—including six new descriptive sections on how governmental institutions work. Tentative: 416 pages; $8.50/paper. February 1977. ISBN 0-06-045282-X. *Instructor's Manual.*

REO M. CHRISTENSON

CHALLENGE AND DECISION

POLITICAL ISSUES OF OUR TIME, FIFTH EDITION

Widely adopted and consistently acclaimed through four editions, the Fifth Edition of CHALLENGE AND DECISION is concise and provocative in its treatment of major domestic political issues.

Presenting a well-rounded range of viewpoints to stimulate classroom discussion, the author analyzes the origins, development, and future course of current political problems. New to this edition are chapters on energy, the economy, the budget, the feminist movement, and pornography. Over 50% of the book constitutes new material. 244 pages; $5.50/paper. August 1976. ISBN 0-06-041267-4.

VERNON F. ANDERSON and ROGER A. VAN WINKLE

IN THE ARENA

THE CARE AND FEEDING OF AMERICAN POLITICS

Facts, analysis, insights, and commentary are candidly revealed by political participants and seasoned observers in this unique book on running for public office. The smoothly integrated text and readings show how the serious game of politics is actually played in local and national arenas and how the campaign process fits into the broad scope of American government.

Special features of the book include a class-tested campaign simulation and boxed inserts presenting unusual or interesting aspects of politics. 425 pages; $6.95/paper. August 1976. ISBN 0-06-046811-4.

New Instructions to Contributors

Address correspondence about contributions to the *Review* concerning issues before the issue of September 1977 to Nelson W. Polsby, Department of Political Science, University of California, Berkeley, California 94720; and issues after September 1977 (including all new manuscripts) starting January 1, 1976, to Charles O. Jones, *American Political Science Review*, Department of Political Science, University of Pittsburgh, Pittsburgh, Pennsylvania 15260. Address all correspondence about pending manuscripts to Charles O. Jones.

Please submit *four* copies of a manuscript to be considered for publication. *Unfortunately, due to increased postage costs, we can no longer return manuscripts to the author.* Manuscripts must be typed and mimeographed or photocopied, with all written material double-spaced (including quotations). Please do not send the original typescript. Since manuscripts are sent out anonymously for evaluation, the author's name and affiliation should appear only on a separate covering sheet and all footnotes identifying the author should also appear on a separate sheet. An abstract of less than 150 words should accompany the manuscript.

The footnote form is that used by most scientific journals. Explanatory notes only will be permitted for most manuscripts (see below); references will be listed alphabetically at the end of the manuscript and in-text references will be made by inserting author or title, year, and page number, if appropriate. For illustration see Fred I. Greenstein and Nelson W. Polsby, eds., *Handbook of Political Science* (Reading, Mass.: Addison-Wesley, 1975). Note: authors of manuscripts on the history of political thought may, if they prefer, use the traditional footnote form when referring to the individual theorist's work; the reference form should be used when referring to secondary works.

All manuscripts will be examined carefully for length. Referees will be asked to recommend where cuts might be made, without affecting the principal contribution. Manuscripts over 30 pages will be reviewed with particular care to determine if such length is warranted. Except in extraordinary circumstances, manuscripts over 50 pages will be returned to the author. Resubmission may follow compliance with the page limit. Manuscripts must be prepared as noted above, double-spaced throughout, with standard margins. Tables, charts, and references will be included in the page count.

Communications must follow the form of regular manuscripts (including reference listings where appropriate). They must be brief and to the point.

Figures should be drawn on white paper with India ink and the original tracings or drawings retained by the author (for transmission later to the printer). Copies only should accompany the manuscript. Tables should be typed on a separate page. Insert a guide line, e.g., "Table 1 about here," at the appropriate place in the manuscript.

ARTICLES

1033 **Industrial Conflict in Advanced Industrial Societies.** This study focuses on strike activity during the 1950–1969 period in ten industrial societies, The first section of the paper deals with issues of strike measurement and introduces a three-dimensional characterization of strike activity which forms the basis of the subsequent statistical analyses. The next section examines postwar trends in industrial conflict in order to evaluate the argument that strike activity is "withering away" in advanced industrial societies. Time plots of the aggregate volume of industrial conflict show that there has been no general downward movement in strike activity during the postwar period.

The third part of the paper develops a number of theoretically plausible statistical models to explain year-to-year fluctuations in the volume of strikes. The empirical results of this section indicate that (1) there is a pronounced inverse relationship between strike activity and the level of unemployment, which suggests that on the whole strikes are timed to capitalize on the strategic advantages of a tight labor market; (2) industrial conflict responds to movements in real wages rather than money wages, which indicates that labor is not misled by a "money illusion"; (3) Labor and Socialist parties are not able to deter strike activity in the short-run despite their strong electoral incentive to do so; and (4) the volume of strikes does seem to be influenced by the relative size of Communist parties, which suggests that such parties remain important agencies for the mobilization of discontent and the crystallization of labor-capital cleavages.

By DOUGLAS A. HIBBS, JR., Associate Professor of Political Science, Massachusetts Institute of Technology.

1059 **The Political Psychology of Religion in Plato's *Laws*.** This paper explains Plato's conception of the relation between politics and "political religion" (ideology) in a nonliberal participatory republican system. The discussion is in the form of a commentary on the drama of a part of Plato's *Laws*. The underlying methodological assumption is that Plato presented his political teaching not so much through the speeches as through the drama of the dialogue, and that he held this to be the most appropriate form for political science because in this way political science can most effectively stimulate thought about its subject matter, the psyche involved in social action.

Following Plato, we focus first on the psychological needs such a political system generates and attempts to satisfy through civil religion. We then move to a consideration of how political "theology" serves to mediate between science and society, or the philosopher and the city.

The essay is intended to contribute to the Montesquieuian project engaging the attention of more and more political theorists: the endeavor to help contemporary political science and psychology escape from the trammeling parochialism of exclusive attention to twentieth century theoretical categories and empirical experiences.

By THOMAS L. PANGLE, Associate Professor of Political Science, Yale University.

1078 **Politicians in Uniform: Military Governments and Social Change in the Third World.** This paper examines three arguments about the impact of military regimes on social change (i.e., economic growth and social reform) in Third-World countries. The first asserts that military governments are progressive; the second claims that they are conservative or reactionary; while the third states that the impact of military regimes on social change varies by level of development. An analysis of covariance model is specified and used first to reanalyze data previously examined by Nordlinger. The results provide no support for any of the three hypotheses, but limitations of the data prevent this from being a convincing test. The model is therefore tested with a second set of data covering 77 politically independent countries of the Third World for the decade 1960 to 1970. Again, the estimates are inconsistent with all three hypotheses and suggest instead that military regimes have no unique effects on social change, regardless of societal type. The paper concludes that the civilian-military government distinction is of little use in the explanation of social change.

By ROBERT W. JACKMAN, Associate Professor of Political Science, Michigan State University.

1098 **Political Compliance and U.S. Trade Dominance.** This study examines influence relations between the United States and countries that are dependent upon their foreign trade with it.

The hypotheses are concerned with political compliance expected of these dependencies as a consequence of their economic vulnerabilities to pressure from the U.S. Informed by trade-related variables and U.N. General Assembly voting behavior of the mid-1960s, the hypotheses find some support. The evidence shows that its dependencies, especially those in the western hemisphere, agree with the U.S. in General Assembly roll calls to a greater degree than do other countries. This compliant behavior, however, is confined to votes that pit the United States against the Soviet Union; when the superpowers are in partial or complete agreement, U.S. dependencies are no more in accord with the U.S. than are other countries. Throughout the study, dependencies are proposed to be vulnerable along four dimensions of their economic circumstances. Interestingly, the respective effects of these four factors are not as hypothesized. Their relative weights in contributing to compliance are largely as expected, but the nature of their partial associations is not. Finally, it happens that most of the dependencies turn out to be Latin American and Caribbean countries, a fact that complicates the interpretation of the statistical results.

By NEIL R. RICHARDSON, Assistant Professor of Government, The University of Texas at Austin.

1110 **Primates and Political Authority: A Biobehavioral Perspective.** This paper presents an evolutionary-biological perspective on the stratification of political authority, power, and influence. The rudiments and relevance of a biobehavioral approach are indicated, particularly in regard to study of the behavior of subhuman primate species. Dominance-deference behavior patterns in four species—rhesus macaques, savanna baboons, gorillas, and chimpanzees—are described and compared, followed by discussion of some stratification concepts that have been derived from primate studies and applied to human societies. The possible continuing influence on man's behavior of his evolutionary history is considered through discussion of a zoologist's attempt to reconstruct it, and through tentative reinterpretations of social psychological conceptions of leader-follower relationships and dispositions to obey authority figures. Finally, it is suggested that the modern conception of political authority *per se* as contingent and contrived may be empirically untenable, and, if so, that certain implications may follow concerning theories of political obligation and constitutionalism.

By FRED H. WILLHOITE, JR., Professor of Political Science, Coe College.

1127 **Political Processes and Public Expenditures: A Re-examination Based on Theories of Representative Government.** Studies attempting to predict public expenditures using political variables have generally incorrectly assumed that political, like socioeconomic, variables function as determinants of policy levels and types. If one assumes, however, that the function of the political process in representative government is to translate citizens' demands for various levels of services as accurately as possible, then political variables must be conceptualized as mediating in character. In the absence of knowledge of whether public services are being oversupplied or undersupplied in relation to citizen demands, the effects of political variables can therefore, be better tested by moving beyond single-equation regression models.

An alternative method for examining impacts of political variables is presented by integrating them with conventional theories of political representation. This leads to a concept of "translation error," and ways of examining relationships between this concept and political variables are explicated. Finally, the greater theoretical utility of this reformulation for the study of public policy is examined, and empirical studies which indicate its validity are cited.

By R. KENNETH GODWIN, Associate Professor of Political Science, Oregon State University, and W. BRUCE SHEPARD, Assistant Professor of Political Science, Oregon State University.

1136 **Crude Communism and Revolution.** The paper is an examination of the relationship between Marx's theory of communism and his theory of revolution in the early writings. Avineri's claim that the *Paris Manuscripts* contain a two stage theory of future society is critically evaluated. It is argued that by crude communism Marx meant an incorrect theory of communism and not a description of the next stage of society. Confusion results from taking Marx's discussion of two stages in the *Critique of the Gotha Program* and reading the more sophisticated analysis of the later works back into the early writings. A discussion of the relationship between revolutionary theory and practice as formulated in the early writing is offered in order to sub-

stantiate the claim that Marx never thought that socialist society had to pass through the stage of crude communism.

By DAVID RESNICK, Assistant Professor of Government, Cornell University.

Comment. By SHLOMO AVINERI, Herbert Samuel Professor of Government, The Hebrew University of Jerusalem.

Rejoinder. By DAVID RESNICK.

1156 **Explaining Party Cohesion in Congress: The Case of Shared Policy Attitudes.** Partisanship has often been noted as one of the most conspicuous factors in legislative voting in the U.S. Congress. This paper attempts to trace party voting to shared policy goals. After the mean attitudes of congressmen belonging to the same party were ascertained for a number of policy domains, the effect of mean party attitudes on roll-call voting was estimated by regression analysis, taking into account the deviation of individual congressmen from their respective mean party attitudes. The results demonstrate that in all three policy domains examined, i.e., social welfare, civil rights, and foreign policy, shared party attitudes leave a strong imprint on individual roll-call decisions. The voting decisions of congressmen, in fact, are found to owe more to the shared party attitudes than to their own individual attitudes. The paper also explores the communication process through which shared policy attitudes are translated within Congress into partisan roll-call votes and points to a way of reconciling the "predispositional" and the "interactional" approach to legislative decision making.

By HELMUT NORPOTH, Research Associate, Zentralarchiv für empirische Sozialforschung, University of Cologne.

1172 **Symmetric Spatial Games Without Majority Rule Equilibria.** The assumptions imposed in spatial models of election competition generally are restrictive in that they require either unidimensional issue spaces or symmetrically distributed electorate preferences. We attribute such assumptions to the reliance of these models on a single concept of a solution to the election game —pure strategy equilibria—and to the fact that such equilibria do not exist in general under less severe restrictions. This essay considers, then, the possibility that candidates adopt mixed minimax strategies. We show, for a general class of symmetric zero-sum two-person games, that the domain of these minimax strategies is restricted to a subset of the strategy space and that for spatial games this set not only exists, but if preferences are characterized by continuous densities, it is typically small. Thus, the hypothesis that candidates abide by mixed minimax strategies can limit considerably our expectation as to the policies candidates eventually advocate. Additionally, we examine the frequently blurred distinction between spatial conceptualizations of two-candidate elections and of committees, and we conclude that if pure strategy equilibria do not exist, this distinction is especially important since committees and elections can produce entirely different outcomes.

By RICHARD D. MCKELVEY, Assistant Professor of Political Science, Carnegie-Mellon University, and PETER C. ORDESHOOK, Professor of Political Science, Carnegie-Mellon University.

1185 **An Interorganizational Analysis of Power, Conflict, and Settlements in Public Sector Collective Bargaining.** Despite increased interest in public sector collective bargaining, a survey of recent attempts to build theory about the dynamics and outcomes of union-management negotiations in public organizations reveals that little progress has been made. One approach that appears fruitful is interorganizational analysis. In an interorganizational context, organizations interact with other autonomous organizations to make joint decisions that have implications for both parties and for the larger system. This study focuses on five interorganizational variables that are useful for understanding the collective bargaining process in the public sector: (1) goal divergence; (2) stability of the relationship; (3) organizational dependence; (4) conflictual behavior; (5) contractual change.

From these theoretical concepts, five propositions are derived which serve as the basis for the research hypotheses. The hypotheses were tested on a sample of 60 cases drawn from a population of 535 collective bargaining negotiations in New York City from 1968 through 1972. The test of the research hypotheses resulted in these conclusions: (1) a substantial amount of the conflictual behavior in public sector collective bargaining is explained by goal divergence, stability of the relationship, and asymmetry of relative dependence favoring one of the organiza-

tions; and (2) contractual change is explained by goal divergence, conflictual behavior, and asymmetry of relative dependence favoring one of the organizations.

By JAMES L. PERRY, Assistant Professor, Graduate School of Administration, University of California, Irvine, and CHARLES H. LEVINE, Associate Professor, Maxwell School of Citizenship and Public Affairs, Syracuse University.

1202 **Hollow Victory: The Minimum Winning Coalition.** The proof of Riker's size principle is inadequate for the general class of zero-sum bargaining games (whether symmetric or asymmetric) and the principle is valid only for a very restricted class of games—the supersymmetric games and their asymmetric counterparts. Butterworth's modification of the size principle (the maximum number of positive gainers principle) can be extended to cover games which are only approximately symmetric. Roll-call voting in the United States House of Representatives overwhelmingly violates the size principle; hence, the House does not generally play a supersymmetric zero-sum bargaining game. More generally, both Butterworth's and Riker's principles seem inapplicable to large bodies.

By RUSSELL HARDIN, Associate Professor of Government and Politics, University of Maryland, College Park.

About the American Political Science Review

The American Political Science Review, published quarterly during the months of March, June, September, and December, is supplied to all APSA members. Membership dues are charged according to the following schedule:

Membership Category	*Dues*
Regular	
Annual income	
Under $12,000	$25
$12,000–14,999	$30
$15,000–19,999	$35
$20,000–24,999	$40
$25,000–29,999	$45
$30,000 and over	$50
Student and Retired	$12
Family	$5
Life	$1000
Institutional (includes *APSR* and *PS*)	$50 domestic $52 foreign

Student memberships are limited to five years per person. Foreign currency at the official exchange rate will be accepted for foreign subscriptions and foreign membership fees. The equivalent of $3 for additional postage should be added for foreign subscriptions.

Current issues are priced at $10.50 per copy; for *back issues prior* to 1970 address Walter J. Johnson, Inc., 355 Chestnut St., Norwood, New Jersey 07648; for issues 1970 and later send request directly to the American Political Science Association.

Applications for membership, orders for the *Review*, and remittances should be addressed to the Executive Director, The American Political Science Association, 1527 New Hampshire Ave., N.W., Washington, D.C. 20036. *Notices of change of address* should be received in the Washington office by the 25th day of the months before publication.

Address books intended for review to Paul A. Beck, Book Review Editor, *American Political Science Review*, Department of Political Science, Mervis Hall, University of Pittsburgh, Pittsburgh, Pennsylvania 15260. Information, including News and Notes, for the Association's news-journal, *PS*, should be sent to 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036; advertising reprint and circulation correspondence should be sent to the Executive Director at the Washington office. Domestic claims for non-receipt of issues must be made within six months of the month of publication; overseas claims, one year. Advertising information and rates are available from Nancy Edgerton, Adv. Manager, APSA, 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.

Articles and notes appearing in the *Review* before the June 1953 issues were indexed in *The Reader's Guide to Periodical Literature*. Current issues are indexed by *The International Political Science Abstracts* and the *Social Sciences and Humanities Index*. Microfilm of the *Review*, beginning with Volume 1, may be obtained from University Microfilms, 313 North First Street, Ann Arbor, Michigan 48106. A *Cumulative Index of the Review*, Volumes 1–62; 1906–1968, may also be obtained from University Microfilms. Articles appearing in the *Review* are listed regularly in *ABC Pol Sci* and *Current Contents: Behavioral, Social & Management Sciences*. Book reviews are indexed in *Book Review Index*.

Industrial Conflict in Advanced Industrial Societies*

DOUGLAS A. HIBBS, JR.
Massachusetts Institute of Technology

Labor strikes have long held the interest of economic historians, social scientists, industrial relations specialists, and statisticians. The reason is that secular movements and short-term fluctuations in strike activity are an invaluable source of quantitative information about the state of labor-capital relations, working-class militancy, and general socioeconomic unrest. In part because strike participation was commonly viewed during the nineteenth century as a form of criminal activity, but also because strikes are overt, dramatic expressions of discontent, data on industrial disputes have been carefully compiled over long time periods in most industrial nations. The size, duration, and frequency of strikes are of course not the only indices of working-class grievances. Chronic absenteeism, high labor turnover rates, pilferage, work slowdowns, outright sabotage, as well as various kinds of political protest and rebellion, are also significant manifestations of discontent which, unlike strikes, have unfortunately not been recorded with any regularity. Nevertheless, strikes remain an important instrument of collective working-class economic action, and they pose a direct challenge to the authority of management, capital and, increasingly, government in industrial societies.

This study focuses on strike activity during the 1950–1969 period in ten advanced industrial societies: Belgium, Canada, France, Italy, Japan, the Netherlands, Norway, Sweden, the United Kingdom, and the United States. Two considerations motivated the selection of these nations for investigation. First, working-class economic and political organizations, have on the whole been free of direct repression in these societies since World War II, and patterns of labor-management confrontation can therefore be meaningfully compared. Second, reliable data on socioeconomic and political variables necessary for the empirical evaluation of theoretical arguments are available for each of these countries during most of the postwar period.

The main body of the paper has three principal parts. The first section deals with issues of strike measurement and introduces a three-dimensional characterization of strike activity which forms the basis of subsequent statistical analyses. The next section examines trends in industrial conflict in the postwar period and is designed to dispose of the argument that strike activity and labor militancy are "withering away" in advanced industrial societies. The third and most important part of the study develops a number of theoretically plausible statistical models to explain short-term fluctuations in the volume of strikes. The models investigated in this section incorporate a variety of economic and political factors that are commonly believed to influence strike activity. The economic factors include (1) movements in real wages, which are given an expectation-achievement theoretical rationalization; (2) the demand for labor, as indexed by the unemployment rate; and (3) changes in the ratio of aggregate profits to total employee compensation, that is, changes in the relative share of labor vs. capital in the national income. Among the most important political influences evaluated in these models are (1) the incentive of labor-oriented Socialist parties to discourage strike activity on the part of their working-class constituencies, which is posited to be a function of the competitive position of labor-Socialist parties in the political system; and (2) the relative size of Communist parties, which are viewed as significant agencies for the mobilization of labor discontent. A fourth and concluding section of the paper reviews the evidence concerning the impact of economic and political factors on fluctuations in industrial conflict and develops some implications of the statis-

An earlier version of the paper was presented at the IXth World Congress of the International Political Science Association, Montreal, Canada, August 19–25, 1973. This revision has benefited greatly from the comments of Hayward Alker, Donald Blackmer, Daniel Lerner, Charles Myers and Joseph Quinn of the Massachusetts Institute of Technology, Benjamin Page and Adam Przeworski of the University of Chicago, Robert Jackman of Michigan State University, Domenico Mastrangelo of the University of Wisconsin, Peter Lange of Harvard University, and Douglas Smith of Carleton University. I am also grateful to John Chandler and Arthur Neff of the Bureau of Labor Statistics, U.S. Dept. of Labor, Everett Kassalow of the University of Wisconsin, M. Lacroix of the International Labor Office, Geneva and E. Paltig and A. Suchinsky of the Office of External Research, U.S. Dept. of State for providing advice on data sources and supplying a variety of data series. Finally, I am pleased to acknowledge the heroic efforts of Robert Berrier, Rhonda Crane, Giustina Mastrangelo, James Short, Marie Taylor and Nicholas Vasilatos in assisting me with data collection, analysis, editing and typing.

tical results for labor militancy in advanced industrial societies and working-class rationality in the use of the strike weapon.

Strike Measurement

The International Labor Office compiles and publishes data on three basic components of industrial conflict that are supplied by national labor ministries: number of strikes, number of workers involved (strikers), and number of man-days lost. Annual data on these components are reported for economy-wide totals and for nine separate sectors of economic activity. Since strikes rarely occur in the agricultural sector (and those that do are not recorded with great accuracy), it is sensible to exclude agriculture from international and intertemporal comparisons. The mining sector has also been excluded from this analysis because of the rather special character of labor-capital relations in that industry.[1] Hence this study focuses on aggregate strike activity outside of agriculture and mining.

Following the earlier, seminal work of Forchheimer, Knowles, and Goetz-Girey, and the more recent work of Shorter and Tilly, the basic industrial conflict components are used in conjunction with data on employment to form three theoretically distinct strike dimensions — size, duration, and frequency:[2]

Size: Strikers per strike

Duration: Man-days lost per striker

Frequency: Strikes per 1,000 civilian wage and salary workers.

Each of these dimensions is suitable for cross-time, cross-country analysis; however, it is advantageous to array them into a three-dimensional solid or cuboid that represents the profile or "shape" of strikes in a particular nation during a particular time-period. Figure 1 displays two distinctive, hypothetical strike shapes. 1 (a)

[1] The well-known political leftism of miners is paralleled by their atypical militancy in economic confrontations with management. See, for example, Clark Kerr and Abraham Siegel, "The Interindustry Propensity to Strike — An International Comparison," in *Industrial Conflict*, ed. Arthur Kornhauser, Robert Dubin and Arthur Ross (New York: McGraw-Hill, 1954).

[2] See K. Forchheimer, "Some International Aspects of the Strike Movement," *Oxford University Institute of Statistics Bulletin*, 10 (January, 1948); K.G.J.C. Knowles, *Strikes — A Study in Industrial Conflict* (Oxford: Basil Blackwell, 1952); Robert Goetz-Girey, *Le Mouvement des Grèves en France 1919–1962* (Paris: Editions Sirey, 1963); and Edward Shorter and Charles Tilly, "The Shape of Strikes in France, 1830–1960," *Comparative Studies in Society and History*, 13 (January 1971), 60–86.

Small proprietors, entrepreneurs, *rentiers* and other self-employed persons are on the whole not relevant to industrial conflict but constitute a significant fraction of the civilian labor force in some nations and time periods. Therefore they have been excluded from the frequency ratio. The self-employed do of course occasionally strike (witness, for example, the strikes by independent French shopkeepers over the government's profit and price controls in 1973, or the strikes by independent truckers over fuel pricing issues in the United States). However, such events are not included in the industrial conflict data reported to the I.L.O. and are in any case not germane to the line of analysis pursued here.

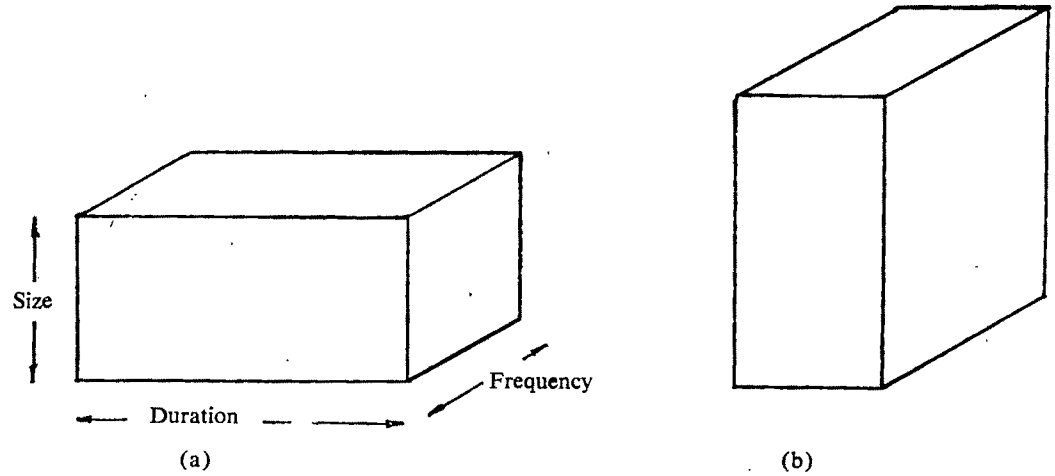

Figure 1. Hypothetical Strike Profiles

depicts the profile shown by Shorter and Tilly[3] to describe nineteenth and early twentieth century strikes in many industrial nations. The typical strike during this initial stage of industrialization was comparatively small in size (few strikers per strike) reflecting the small scale of early establishments; of long duration (many man-days lost per striker) evidencing the bitter, protracted resistance that newly-formed unions encountered from employers; and relatively low in frequency (few strikes per 1000 workers), indicating the rather weak organization and mobilization of the labor force.

Figure 1(b) represents a "modern" strike profile which Shorter and Tilly suggest was more common in the mid-twentieth century. It shows a vastly increased average strike size which was in part produced by the consolidation of industrial establishments, somewhat higher frequency corresponding to the heightened mobilization and organization of the working class, and markedly reduced duration. Hence what might be called the "trench warfare" pattern of infrequent, long, but relatively small strikes that typified disputes between capital and newly organized labor in the nineteenth century seems to have been supplanted by a "guerrilla warfare" pattern of frequent, short, and relatively large "lightning" strikes in more recent decades.

Aside from the structural changes that undoubtedly contributed to this historical evolution of strike profiles (growth in firm size, the extension of labor organization, and so on), there appears to be a rational basis for labor's abandoning the trench warfare pattern of Figure 1(a) in favor of the guerrilla warfare approach of Figure 1(b). Although the evidence on this score is slim, Knowles's study of industrial conflict in Great Britain and Peterson's analysis of work-stoppages in the United States indicate that strike outcomes were more likely to be favorable to employers when conflicts were infrequent, long in duration, and small in size, whereas the probability of worker's victory was enhanced when strikes were frequent, short in duration, and large in size.[4] Thus, the long-term change in strike profiles may partly reflect a working-class learning process informed by the historical experience of labor-capital struggles.

Contemporary cross-national patterns provide some additional evidence that rational working-class behavior may underlie observed differences in aggregate strike shapes. For example, in France and Italy where the most important unions are essentially Leninist organizations with relatively small memberships and slender financial resources, the guerrilla warfare strike profile of Figure 1(b) is pronounced. Organized labor in these nations could not well withstand long sieges or tests of strength against management and therefore the relatively large, brief, and frequent "lightning" strike prevails.[5] The strike profiles of the United States and Canada, on the other hand, more nearly resemble the trench warfare pattern of Figure 1(a). Unions in these countries have large dues-paying memberships and as a result command the substantial strike funds necesary to engage in comparatively long trials of strength against management.

Although comparative time-series analysis of strike profiles is a potentially useful line of inquiry, the primary purpose of this paper is to develop statistical models explaining short-run postwar fluctuations in overall strike magnitudes. What we need is a single series that captures the net "damage" or impact of strikes. Perhaps the most suitable index of overall strike activity is the volume of the three-dimensional strike profile. The volume of any cuboid is of course the product of its three dimensions. Accordingly we calculate a quantity akin to the physical concept of volume:

$$\textit{Strike Volume} = \begin{matrix}\text{Man-days lost}\\ \text{per 1000 wage}\\ \text{and salary workers}\end{matrix} = \text{Frequency} \times \text{Duration} \times \text{Size}$$

$$= \frac{\textit{Strikes}}{\text{1000 workers}} \times \frac{\textit{Man-days lost}}{\text{Striker}} \times \frac{\textit{Strikers}}{\text{Strike}}$$

[3] Edward Shorter and Charles Tilly, "The Shape of Strikes in France."

[4] Knowles, *Strikes*, and Florence Peterson, *Strikes in the United States, 1880–1936* (Washington: U.S. Department of Labor, Bureau of Labor Statistics, Bulletin No. 651, 1937).

[5] The contrast between the traditional, war-of-attrition strike familiar to most Americans and the guerrilla warfare strategy described in the text is put into even sharper focus by the description of the latter pattern given by Blumenfeld: "Italian unions, which have no strike funds, have developed a whole range of disruptive activities. Among these are the 'chessboard' strike, involving only selected departments; the 'paybook' strike, in which every worker whose paycard carries an odd number engages in disputes on odd days of the week, while workers with even numbers fight out their claims on the even days; and strikes in which blue-collar workers lay down their tools in the morning but return to work after lunch, only to find that the white-collar clerks are out — thus stopping work for an entire day with the loss of only a half a day's pay." See Yorick Blumenfeld, "Industrial Strife in Western Europe," *Editorial Research Reports*, 21 (June 1971),

Man-days lost from strikes per 1000 wage and salary workers not only has substantial theoretical justification, being the volume of a three-dimensional profile that characterizes strike activity at any time or place, but also has obvious intuitive appeal as a comprehensive index of industrial conflict. Since it represents the net impact of a nation's overall strike profile it permits comparative, dynamic analyses that are not confounded by changes in a single conflict dimension. Erroneous conclusions about the "withering away" of industrial conflict, which can arise by focusing exclusively on one strike dimension and mistaking decreases in it for decreases in overall strike activity, are therefore avoided. Notice, for example, the reduction in strike duration but not in overall strike volume between Figures 1a and 1b.

A Withering Away of the Strike?

Perhaps the most influential comparative investigation of strike activity is Ross and Hartman's *Changing Patterns of Industrial Conflict* (1960). One of the principal conclusions of this study is that industrial conflict has (with few exceptions) virtually "withered away" in advanced industrial societies. Ross and Hartman attribute this decline in strike activity to changes in employer policies, dispute-settlement techniques, governmental functions, and union programs, as well as to the persistence of full employment, the decline of ideology and class bitterness, the improvement of living standards and *embourgeoisement* of the working class, and to the enormous growth in white collar, professional and service class employment that has accompanied the shift from industrial to "postindustrial" socioeconomic formations.

The following section evaluates a number of these propositions more formally — here we focus directly on the "withering away" thesis. Ross and Hartman construct a large number of strike indices in the course of their analysis, but unfortunately the withering away argument depends heavily on only two measures: man-days lost per union member ("Membership Loss Ratio") and man-days lost per striker ("Duration"). The former ratio is a particularly weak index from which to draw general conclusions about the time path of industrial conflict. For some countries union membership data are notoriously inaccurate (e.g., France and Italy), and the meaning of unionization differs so greatly across nations that international comparison of a union membership ratio is highly suspect. More important, the general temporal decline Ross and Hartman observe in man-days lost per union member is at least in part an artifact of the union membership rate of growth exceeding that of the total wage and salary labor force during the period of massive labor mobilization treated by their study (1900–1956). In other words, if union membership was growing with respect to time more rapidly than the total wage and salary labor force, then it is possible for man-days lost per *union member* to exhibit a downward time trend, while man-days lost per *worker* was holding steady or even increasing through time. Indeed, the data series reported by Ross and Hartman in the appendices of their study indicate this was true in many industrial societies.

Decreases over time in the second index, man-days lost per striker (duration), are of course not artificial, but do not necessarily imply a declining strike volume, as the reduction in strike duration but not overall strike volume between Figures 1(a) and 1(b) illustrates. The most direct way to evaluate the secular evolution of aggregate strike activity is to examine the volume of strikes over time. Figure 2 presents graphs of strike volumes — man-days lost per 1000 wage and salary workers — for each of the ten nations investigated in this paper.

It is apparent from these graphs that despite the substantial growth of postindustrial, service-oriented sectors of economic activity in all of these nations, and notwithstanding the supposed decline of ideology and *embourgeoisement* of the working-class, there has been no general "withering away" of the strike in the postwar period. The strike volumes of most of the nations in Figure 2 simply do not exhibit any pronounced downward trend. Indeed, *long-run* time trend analyses of a more formal sort (not reported here) reveal that substantial declines in aggregate strike activity are found only in the smaller democracies of Northern Europe and Scandinavia.[6] The evolution of postindus-

409–426. Sartori provides an interesting, although exaggerated, assessment of the leverage that "guerrilla warfare" strike strategies (known as *scioperi articolati* in Italy and *débrayages* or *grèves tournantes* in France) gives labor in service-dependent, "postindustrial" societies. See Giovanni Sartori," "Il Potere Del Lavoro Nella Societa Post-Pacificata," *Revista Italiana Di Scienza Politica,* ANNO III (Aprile 1973), 31–81.

[6] An extensive analysis of twentieth century trends in industrial conflict is given in my paper "Long-Run Trends in Strike Activity in Comparative Perspective," mimeo., 1976. Aaron's thoughtful review of the evidence for six European nations, and Erickson and Grofman's preliminary analyses of long-term trends in fifteen industrial societies also square with the conclusions drawn here. See Benjamin Aaron, "Methods of

trial social structure, then, does not seem to have resolved the grievances or reduced the militancy of wage labor. As the French sociologist Alain Touraine has observed, "A purely consumer society in which the industrial sector would be very much restricted and the problems of work no longer of interest to leisured wage-earners is sociological fiction. . . . The chiefs of the industrial complex would not be so preoccupied with the problems of labor if they were not worried about new protests and socio-political militancy in a milieu they had judged conservative."[7]

Although the graphs in Figure 2 give no evidence of a general downward movement or "withering" of strike activity, the conflict series do show substantial cross-national variation and year-to-year fluctuation. The next section develops some statistical models designed to account for the short-term fluctuations casually.

Statistical Models of Industrial Conflict

A survey of the literature on industrial conflict suggests that most of the factors believed to influence intertemporal and international variations in strike activity can conveniently be partitioned into two broad categories. These are (1) the state of the economy, particularly, movements in real wages, profits, and the demand for labor; and (2) the configuration of parties in the political system, especially the competitive position of labor-oriented parties on the non-Communist left and the extent of Communist Party influence in the work force. This section briefly develops the relevant theoretical arguments, attempts to specify the appropriate structural equations, evaluates the capability of contrasting models to account for postwar (1950–1969) fluctuations in the volume of strikes in

Industrial Action: Courts, Administrative Agencies, and Legislatures," chapter 2 in *Industrial Conflicts: A Comparative Legal Survey*, ed. Benjamin Aaron and K. W. Wedderburn (London: Wm. Clowes & Sons, Ltd., 1972); and K. Erickson and B. Grofman, "A Comparative Longitudinal Analysis of Strike Activity: Applications to Industrialized and Industrializing Economies," Paper delivered at the International Political Science Association Meeting, Montreal, Canada, August, 1973.

the ten-nation sample, and tests the stability of model parameters across institutionally diverse industrial relations systems.

Unemployment, Profits, and Real Wages. It has frequently been argued (although not without qualifications) that the strike is a more effective weapon during periods of general prosperity than during periods of widespread economic hardship. Indeed, there is considerable evidence that strike activity tends to follow the business cycle, increasing at cycle peaks and dropping off during business downturns.[8] Business cycle hypotheses and related propositions are best articulated in terms of unemployment, profits, and real wages.

The level of unemployment is perhaps the most sensitive indicator of general business conditions (countercyclical), and it is natural to expect working-class militancy to vary inversely with it. Low unemployment offers great strategic advantages to an aggressive labor force. A tight labor market means that management will have difficulty replacing potential strikers, who in any case can anticipate good prospects for securing permanent employment elsewhere if employers are able to replace them successfully. Opportunities for temporary or part-time employment during the course of a strike are also likely to be good. The situation is reversed when unemployment is high and there is an excess supply of labor. Strike-breakers are more easily recruited by employers and alternative job opportunities for strikers are reduced.[9] Faced

[8] See Jean Bouvier, "Mouvement Ouvrier at Conjonctures Economiques," *Le Mouvement Social* (Juillet-Septembre, 1964), pp. 3–30; Robert Goetz-Girey, *Le Mouvement des Grèves en France;* Knowles, *Strikes;* F. S. O'Brien, "Industrial Conflict and Business Fluctuations: A Comment," *Journal of Political Economy,* 73 (1965), 650–654; Albert Rees, "Industrial Conflict and Business Fluctuations," in Kornhauser, Dubin and Ross, *Industrial Conflict;* and Andrew Weintrub, "Prosperity Versus Strikes: An Empirical Approach," *Industrial and Labor Relations Review,* 19 (January 1966), 231–238.

[9] It is not really necessary that employers *actually* replace strikers with great regularity — it is the *psychological* threat that is important, and this is heightened during periods of high unemployment. For example, after the 1970–71 recession in the United States, *The Wall Street Journal* ran a front page article on the "conciliatory mood" of U.S. workers. The story read in part: " . . . across the country at large and small companies, workers are choosing to be more conciliatory when faced with the threat of losing their jobs. This is

with decreased product demand, capital is unlikely to be affected adversely by a prolonged work stoppage, and may even welcome an interruption of production in a period of receding profits and excessive inventories.[10] Hence, potential strikers are more vulnerable and militancy is discouraged. Letting SV and U denote strike volume and the level of unemployment, respectively, we therefore would expect $\partial SV_t/\partial U_t < 0$.

The effect of profits on strikes is more problematic. From the perspective of working class aggressiveness, the relevant quantity is returns to capital as a ratio of returns to labor, that is, Aggregate Business Profits/Total Employee Compensation. It seems reasonable to assume that when the profit ratio is increasing, workers will escalate their demands and press them more militantly. Other things being equal, this should produce an upward movement in the volume of strikes. However, management is more likely to yield to labor demands in such situations because of the severe opportunity costs of absorbing a strike when markets are expanding and profits are potentially high. As Hicks put it in his classic *The Theory of Wages*, ". . . when trade is good, the cost of a strike to the employers will be immensely enhanced. Once an employer is making large profits, and expects those profits to continue in the near future, he is an easy mark for union demands. He will nearly always be prepared to make some concession in order to avoid a strike."[11] The net impact of changes in profits on strike activity is therefore uncertain. Letting ΔC denote the rate of change of the profit ratio, we have $\partial SV_t/\partial \Delta C_t \lesseqgtr 0$.

My specification of the influence of real wages[12] on industrial conflict is based on expectation-achievement theory. The thrust of the theory is that aggressive, violent, or protest behavior is caused in part by a gap between expectation and achievement. Variants of the theory have appeared in all branches of social science. For example, writing of civil violence, Gurr observes: "The fundamental cause of civil strife is deprivation-induced discontent: the greater the discrepancy between what men believe they deserve and what they think they are capable of attaining, the greater their discontent. The more intense and widespread discontents are in society, the more intense and widespread strife is likely to be."[13] Similarly, James Davies has argued that collective disorder ". . . is most likely to take place when a prolonged period of rising expectations and rising gratifications is followed by a short period of sharp reversal, during which the gap between expectations and gratifications quickenly widens and becomes intolerable."[14] In a statement of the theory closer to the topic of this study, the psychologists Krech and Crutchfield have written: "A wage rate is psychologically inadequate, no matter how large in absolute amount, if it results in a wide discrepancy between the worker's level of aspiration and his level of achievement."[15]

Although expectation-achievement theory has not received consistent support from empirical studies and tends to understate or ignore altogether the importance of structural factors for conflict behavior, the basic thesis provides a plausible theoretical framework within which to specify the impact of real wage movements on strike activity. Since labor-management conflict

---

in sharp contrast to the labor scene of recent years (i.e., when unemployment was low), both union and corporate officials agree. Not long ago, they say, rank-and-filers . . . would probably have been angered by the thought of concessions . . . many manufacturing executives have openly complained in recent years that too much control had passed from management to labor. With sales sagging . . . they feel safer in attempting to restore what they call "balance" (January 26, 1972, p. 1, cited in Raford Boddy and James Crotty, "Class Conflict and Macropolicy: The Political Business Cycle," *Review of Radical Political Economics*, 7 [Spring, 1974], 1–19).

[10] For a contrary argument which contends that strikes have greater disutility for firms when economic activity is low (unemployment high) see John Vanderkamp, "Economic Activity and Strikes in Canada," *Industrial Relations*, 9 (February 1970), 215–230.

[11] Sir John Hicks, *The Theory of Wages* (New York: St. Martin's Press, 1963), p. 156.

[12] "Real" wages refer of course to money wages deflated for price increases, that is, $R = W/P$ where R, W, and P denote real wages, money wages, and a price index, respectively. A following section deals with the "money illusion" thesis that labor militancy responds to money wage increases alone.

[13] "A Comparative Study of Civil Strife," in *Violence in America*, ed. Hugh Davis Graham and Ted Robert Gurr (New York: New American Library 1969), p. 590.

[14] James C. Davis, "The Curve of Rising and Declining Satisfactions as a Cause of Some Great Revolutions and a Contained Rebellion," in Graham and Gurr, p. 671.

[15] David Krech and R. S. Crutchfield, *Theory and Problems of Social Psychology* (New York: McGraw-Hill, 1948), p. 542. Economists and industrial relations specialists also have used expectational explanations of worker unrest and militancy. See, for example, *Trade Union Government and Collective Bargaining: Some Critical Issues*, ed. Joel Seidman (New York: Praeger Publishers 1970), particularly the essays of Barbash and Wirtz.

typically centers on proportional wage increases rather than wage levels,[16] a reasonable functional form in the present context is

$$(1)\quad SV_t = \beta_0 + \beta_1(\Delta R_{t-1} - \Delta R^*_{t-1}) + \text{other factors}$$

$$\partial SV_t/\partial(\Delta R_{t-1} - \Delta R^*_{t-1}) < 0,$$

where SV = strike volume (man-days lost per 1000 workers)
ΔR = actual percentage rate of change of real wages
ΔR^* = expected percentage rate of change of real wages.

Strike volume in the current period is therefore hypothesized to be (partly) a function of the disparity between actual and expected real wage changes in the recent past. When ΔR_{t-1} exceeds ΔR^*_{t-1} strike activity should decrease, whereas if the gap between actual and expected real wage changes runs the other way, strike volume is anticipated to increase.[17]

As things stand ΔR^* is unobserved and Equation (1) is not estimable. Since attitudinal (survey) time-series data on labor force real wage expectations do not exist, we need a plausible model that specifies ΔR^* in terms of observed quantities. The theoretical and statistical literature on the formation of expectations (expectation generating functions) presents several reasonable alternatives.[18] Consider first the so-called "extrapolative" expectations model:

$$(2)\quad \Delta R^*_t = \Delta R_{t-1} + \gamma(\Delta R_{t-1} - \Delta R_{t-2}).$$

The extrapolative expectations model asserts that the expected change in real wages in the current period equals the actual change in the previous period plus a correction to allow for the trend observed over the preceding period. If $\gamma > 0$, the labor force expects past trends to continue (extrapolative expectations), whereas if $\gamma < 0$ a reversal of past trends is anticipated (regressive expectations). If $\gamma = 0$, real wage expectations are static.

Collecting the hypotheses regarding unemployment, profit ratios, and the gap between actual and expected real wage increases yields the following theoretical model:

$$(3)\quad SV_t = \beta_0 + \beta_1(\Delta R_{t-1} - \Delta R^*_{t-1}) + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t.$$

Substitution of the extrapolative model of (2) for ΔR^*_{t-1} in (3) produces an estimating equation that is composed entirely of observed variables.

$$(4)\quad SV_t = \beta_0 + \beta_1[\Delta R_{t-1} - (\Delta R_{t-2} + \gamma(\Delta R_{t-2} - \Delta R_{t-3}))] + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t$$

$$SV_t = \beta_0 + \beta_1 \Delta R_{t-1} - \beta_1 \Delta R_{t-2} - \beta_1 \gamma \Delta R_{t-2} + \beta_1 \gamma \Delta R_{t-3} + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t$$

$$SV_t = \beta_0 + \beta_1(\Delta R_{t-1} - \Delta R_{t-2}) - \beta_1 \gamma(\Delta R_{t-2} - \Delta R_{t-3}) + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t$$

A second model for expectations is the "adaptive" scheme. As initially formulated by Cagan and Nerlove, this model is

$$(5)\quad \Delta R^*_t - \Delta R^*_{t-1} = (1 - \lambda)(\Delta R_{t-1} - \Delta R^*_{t-1}) \qquad 0 < \lambda < 1.$$

The conventional adaptive model posits that expectations are revised linearly each period in proportion to some fraction of last period's forecast error. Hence, current expectations are formed

[16] Even the massive strikes of May–June 1968 in France (which were viewed largely as spontaneous "political" events in many popular and academic accounts) centered in the overwhelming majority of cases around traditional demands for wage increases and were called, promoted, and directed by the usual labor organizations. (See Claude Durand, "Revendications Explicites et Revendications Latentes," *Sociologie du Travail* (October–Décembre 1973), pp. 394–409 and George Ross, "French Working Class Politics After May–June 1968: A New Working Class?" Paper delivered at the 1973 Annual Meeting of the American Political Science Association, New Orleans, Louisiana, September 1973. Such strikes of course have important political implications in the sense that they challenge state economic policies designed to hold down the rate of increase of wages and prices.

[17] In the current period ΔR is likely to be influenced by SV and so the model in (1) should be viewed as an abbreviated form of a larger system within which ΔR and ΔR^* are lagged endogenous variables.

[18] See Kenneth J. Arrow and Marc Nerlove, "A Note on Expectations and Stability," *Econometrica*, 26 (April 1958), 297–305; Phillip D. Cagan, "The Monetary Dynamics of Hyperinflation," in *Studies in the Quantity Theory of Money*, ed. Milton Friedman (Chicago: University of Chicago Press, 1956); Allan C. Enthoven and Kenneth J. Arrow, "A Theorem on Expectations and the Stability of Equilibrium," *Econometrica*, 22 (April 1956), 288-293; Josef Hadar, "On Expectations and Stability," *Behavioral Science*, 13 (November 1968), 445–454; Marc Nerlove, "Adaptive Expectations and Cobweb Phenomena," *Quarterly Journal of Economics*, 72 (May 1958), 227–240; and Steven J. Turnovsky, "Empirical Evidence on the Formation of Price Expectations," *Journal of the American Statistical Association*, 65 (December 1970), 1441–1454.

by adapting or modifying previous expectations in the light of previous experience. This implies, however, that if real wage increases are accurately anticipated in the past, expectations are static, that is, when $\Delta R_{t-1}=\Delta R^*_{t-1}$, $\Delta R^*_t=\Delta R^*_{t-1}$. For our purposes it seems more reasonable to allow for a systematic escalation of labor-force real wage expectations over time. Accordingly, the standard adaptive expectations model is modified to provide for a trend:

$$(6)\quad (\Delta R^*_t-\Delta R^*_{t-1})=(1-\lambda)(\Delta R_{t-1}-\Delta R^*_{t-1})+\delta\Delta R^*_{t-1}$$
$$0<\delta<1$$
$$0<(\lambda+\delta)<1.$$

This model permits current expectations to escalate (or de-escalate) by the trend factor $\delta\Delta R^*_{t+1}$ even if actual and expected real wage increases in the recent past are identical.

Rewriting the modified adaptive expectations model of (6) yields

$$(7)\quad \Delta R^*_t = \Delta R^*_{t-1} + \Delta R_{t-1} - \lambda\Delta R_{t-1} - \Delta R^*_{t-1} + \lambda\Delta R^*_{t-1} + \delta\Delta R^*_{t-1}$$
$$\Delta R^*_t = (1-\lambda)\Delta R_{t-1} + (\lambda+\delta)\Delta R^*_{t-1},$$

which upon repeated substitution gives

$$(8)\quad \Delta R^*_t = (1-\lambda)\sum_{i=0}^{\infty}(\lambda+\delta)^i\,\Delta R_{t-i-1}.$$

The theoretical model for strike volume in (3) corresponding to the revised adaptive expectations scheme in (8) can now be written:

$$(9)\quad SV_t = \beta_0 + \beta_1\left[\Delta R_{t-1} - \left((1-\lambda)\sum_{i=0}^{\infty}(\lambda+\delta)^i\,\Delta R_{t-i-2}\right)\right] + \beta_2 U_t + \beta_3\Delta C_t + \epsilon_t.$$

The infinite, geometrically declining lag in ΔR_{t-i-2} means that (9) is not estimable in its present form. This is readily circumvented by applying the so-called "Koyck transformation." Lagging (9) one period and multiplying through by $(\lambda+\delta)$ we obtain

$$(10)\quad (\lambda+\delta)SV_{t-1} = (\lambda+\delta)\beta_0 + (\lambda+\delta)\beta_1\left[\Delta R_{t-2} - \left((1-\lambda)\sum_{i=0}^{\infty}(\lambda+\delta)^i\,\Delta R_{t-i-3}\right)\right] + (\lambda+\delta)\beta_2 U_{t-1} + (\lambda+\delta)\beta_3\Delta C_{t-1} + (\lambda+\delta)\epsilon_{t-1}.$$

Subtracting this expression from (9) produces an empirical estimating function with finite lag.[19]

$$(11)\quad SV_t = \beta_0(1-\lambda-\delta) + (\lambda+\delta)SV_{t-1} + \beta_1(\Delta R_{t-1}-\Delta R_{t-2}) - \beta_1\delta\Delta R_{t-2} + \beta_2 U_t - (\lambda+\delta)\beta_2 U_{t-1} + \beta_3\Delta C_t - (\lambda+\delta)\beta_3\Delta C_{t-1} + (\epsilon_t - (\lambda+\delta)\epsilon_{t-1}).$$

Our final expectation-achievement function has a theoretical basis somewhat different from that underlying the previous models. In this specification, strike activity is determined by the gap between actual real wage changes over *several* recent periods and the expected *long-run* increase in real wages.[20]

$$(12)\quad SV_t = \beta_0 + \beta_1(\Delta R' - \Delta R^*) + \text{other factors}$$
$$\partial SV_t/\partial(\Delta R' - \Delta R^*) < 0,$$

where $\Delta R'$ = actual real wage changes over several recent periods
ΔR^* = the expected long-run increase in real wages.

Thus, the volume of strikes is hypothesized to increase or decrease depending on whether the rate of change of real wages during recent years has exceeded or fallen short of labor's long-run expectations.

[19] For those who prefer elegance, the result in (11) follows directly from lag algebra. Let B equal a backshift operator such that $B^iY_t = Y_{t-i}$ and rewrite (9)

(a) $SV_t = B_0 + \beta_1[\Delta R_{t-1} - ((1-\lambda)\sum_{i=0}^{\infty}((\lambda+\delta)B)^i\,\Delta R_{t-2})] + \beta_2 U_t + \beta_3\Delta C_t + \epsilon_t$. $\sum_{i=0}^{\infty}((\lambda+\delta)\beta^i)$ may be viewed as a convergent geometric series with solution $1/1-(\lambda+\delta)B$, and thus (a) implies:

(b) $SV_t = \beta_0 + \beta_1[\Delta R_{t-1} - \frac{(1-\lambda)}{1-(\lambda+\delta)B}\Delta R_{t-2}] + \beta_2 U_t + B_3\Delta C_t + \epsilon_t$.

Clearing $_{(b)}$ of the denominator $1-(\lambda+\delta)B$ yields the estimating equation given in (11).

[20] This model is adopted from Orley Ashenfelter and George E. Johnson, "Bargaining Theory, Trade Unions, and Industrial Strike Activity," *American Economic Review*, 50 (March 1969) 35–49. I am grateful to Robert Solow for helping me derive the implications of various lag functions which led to the interpretation given here.

The mechanisms for $\Delta R'$ and ΔR^* are as follows. Recent experience, $\Delta R'$, is defined simply as a finite moving average of previous real wage changes.

$$(13) \qquad \Delta R_t' = \sum_{i=1}^{J} \alpha_i \Delta R_{t-i}$$

$$\Sigma \alpha_i = 1.$$

Long-run expectations, ΔR^*, are formed as the weighted sum of a constant (very long-term) increase parameter (L) and a finite moving average of previous real wage changes.

$$(14) \quad \Delta R_t^* = (1-\rho)L + \rho \sum_{i=1}^{K} \phi_i \Delta R_{t-i}$$

$$\Sigma \phi_i = 1$$

$$0 < \rho < 1.$$

The theoretical expectation-achievement model in (12) can now be expressed in terms of observed variables by substitution of (13) and (14).

$$(15) \quad SV_t = \beta_0 + \beta_1 \left[\sum_{i=1}^{J} \alpha_i \Delta R_{t-i} - \left((1-\rho)L + \rho \sum_{i=1}^{K} \cdot \phi_i \Delta R_{t-i} \right) \right] + \text{other factors}$$

$$SV_t = [\beta_0 - \beta_1(1-\rho)L] + \beta_1 \cdot \left[\sum_{i=1}^{N} (\alpha_i - \rho\phi_i) \Delta R_{t-i} \right] + \text{other factors.}$$

Rewriting, we have

$$(16) \qquad SV_t = \beta_0' + \beta_1 \sum_{i=1}^{N} \mu_i \Delta R_{t-i} + \text{other factors,}$$

$$\text{where } \beta_0' = \beta_0 - \beta_1(1-\rho)L$$

$$\mu_i = (\alpha_i - \rho\phi_i).$$

The lag functions determining the behavior of (13)–(16) are likely to have the following properties. The weighted average of real wage changes defining $\Delta R'$ ("recent experience") will depend heavily on the outcomes of the latest periods, perhaps peaking after a few lags, and the experience of more distant periods will be rapidly discounted. Hence the α_i coefficients forming $\Delta R'$ should be governed by a low-order polynomial lag distribution with a steep rate of decay. In contrast, it is reasonable to anticipate the moving average component of long-run real wage expectations (ΔR^*) to be weighted more equally by current and past experience, which implies a linear or quasigeometric lag distribution with a relatively slow rate of decay in the ϕ_i. The difference of these lag functions (μ_i) is therefore likely to exhibit an inverted U-shaped distribution, which is conveniently estimated by the polynomial distributed lag method of Shirley Almon.[21]

To sum up at midstream, the discussion thus far has developed three plausible models specifying the impact of unemployment, business profits, and real wage changes on the volume of strikes:

Expectation-Achievement Gap: Extrapolative Expectations

$$(17a) \quad SV_t = \beta_0 + \beta_1(\Delta R_{t-1} - \Delta R_{t-2}) - \beta_1\gamma(\Delta R_{t-2} - \Delta R_{t-3}) + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t$$

$$\beta_1 < 0, 0 < \gamma < 1, \beta_2 < 0, \beta_3 < 0$$

Expectation-Achievement Gap: Adaptive Expectations (with trend)

$$(17b) \quad SV_t = \beta_0(1-\lambda-\delta) + (\lambda+\delta)SV_{t-1} + \beta_1(\Delta R_{t-1} - \Delta R_{t-2}) - \beta_1\delta\Delta R_{t-2} + \beta_2 U_t - (\lambda+\delta)\beta_2 U_{t-1} + \beta_3 \Delta C_t - (\lambda+\delta)\beta_3 \Delta C_{t-1} + (\epsilon_t - (\lambda+\delta)\epsilon_{t-1})$$

$$0 < (\lambda+\delta) < 1, \beta_1 < 0, 0 < \delta < 1, \beta_2 < 0, \beta_3 < 0$$

Expectation-Achievement Gap: Long-Run Expectations (polynomial distributed lag)

$$(17c) \quad SV_t = \beta_0' + \beta_1 \sum_{i=1}^{N} \mu_i \Delta R_{t-i} + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t$$

$$\beta_0' < 0, \beta_1 \Sigma \mu_i < 0, \beta_2 < 0, \beta_3 \lesseqgtr 0,$$

where ΔR = the percentage rate of change of real wages,
U_t = the percentage of the civilian labor force unemployed, and
ΔC_t = the rate of change of aggregate profits/total employee compensation.

Table 1 reports the estimation results for Equations (17a)–(17c). Notice that the estimation

	(−5.0)		(0.4)		(−2.0)					

[a] The t-statistics for the regression coefficient estimates are in parentheses. Constant terms vary by country and are omitted. U_t is the % of the civilian labor force unemployed. R_t is average hourly money earnings deflated by the consumer price index. ΔR denotes the % rate of change: $[R_t - R_{t-1}/R_{t-1}] * 100$. C_t denotes the ratio of profits to total employee compensation. ΔC is the rate of change: $[C_t - C_{t-1}]$. SV_t is the volume of strikes outside of Agriculture and Mining and is defined as Total Mandays Lost per 1000 Wage and Salary Earners. The TROLL/1 system was used for estimation.
Sources: Strike data are from I. L. O., *Yearbook of Labor Statistics*, various years. Unemployment and labor force data are from OECD, *Manpower Statistics 1950–1962; Labour Force Statistics 1958–1969*. Employee compensation and Profits data are from OECD, *National Accounts Statistics*. Consumer Price Index data are from *U. N. Statistical Yearbook*, various years. Money earnings data were provided by the Bureau of Labor Statistics, U. S. Department of Labor.

strategy is to pool all observations (20 year time-series, 10 nations), so that strictly speaking the functions should be indexed $SV_{nt} = f(\Delta R_{nt-i}, U_{nt}, \Delta C_{nt})$; $n = 1 \ldots 10$, $t = 1950 \ldots 1969$. Furthermore, all parameters except the constant term are constrained at this point to be invariant through time and space. This amounts to replacing the general intercept constant, β_0, with a series of country-by-country dummy variables, $\sum_{n=1}^{10} \alpha_n$, which pick up the net effects of nation-specific, time-invariant, structural-historical factors not captured explicitly (causally) in the equations.[22] Therefore the models are geared to explaining fluctuations in strike activity in the presence of a location parameter or ignorance term that varies across countries.

The estimates for (17a) and (17b) in Table 1 indicate that neither the extrapolative expectations model nor the adaptive expectations model performs very well in this body of data. The coefficients of the real wage change (ΔR) terms are without exception statistically insignificant and in several cases have the wrong sign. The extrapolative equation (17a) was estimated both linearly (by ordinary least squares) and nonlinearly (along the lines proposed by Marquardt)[23] with the constraint that the parameter γ lie in the interval 0 to 1. The adaptive expectations function (17b) was similarly estimated by ordinary least squares and by a nonlinear-instrumental variables procedure designed to preserve consistency in the presence of the lagged endogenous SV_{t-1} term and potentially autocorrelated disturbances.[24] The constraints imposed in this non-

[22] A fixed, dummy variable approach to the pooled estimation problem is taken here in preference to the alternative random variables, "error components" approach because of computational ease, and also because an important assumption necessary to preserve the consistency of the latter method — that "specific ignorance" be independent of regressors — seems unreasonable. Extensive analyses of pooled estimation strategies are given by G. S. Maddala, "The Use of Variance Components Models in Pooling Cross Section and Time Series Data," *Econometrica*, 39 (March 1971), 341–358; Marc Nerlove, "Further Evidence on the Estimation of Dynamic Economic Relations from a Time Series of Cross Sections," *Econometrica*, 39 (March 1971), 359–382; and T. D. Wallace and Ashig Hussain, "The Use of Error Components Models in Combining Cross Sections with Time Series Data," *Econometrica*, 37 (January 1969), 55–72. Note also that the long-run increase expression $(1-\rho)$ L in (15) is necessarily embedded within the nation-specific intercepts of (17c) and therefore is effectively "lost" for inferential purposes (i.e., these parameters are underidentified).

[23] Donald W. Marquardt, "An Algorithm for Least Squares Estimation of Non-Linear Parameters," *Journal of the Society for Industrial and Applied Mathematics* 11 (June 1963), 431–441.

[24] Note that even if the disturbance of the original adaptive expectations function in (9) is "white noise," application of the Koyck transformation introduces a first-order moving average error process in the estimating equation (17b). As it turned out, however, the errors displayed negligible serial correlation in all equations and so instrumental variables as well as the rather complicated estimation procedures required to secure efficiency in a pooled data model proved unnecessary. A discussion of the estimation problems

linear regression were $0<(\lambda+\delta)<1$ and $0<\delta<1$. Despite great efforts to maximize the success of these models, it appears that strike activity in advanced industrial societies during the postwar period is not well explained by expectation-achievement gap functions of the extrapolative or adaptive variety.

The regression results in Table 1 do, however, provide evidence in favor of the "long-run" (polynomial distributed lag) expectation-achievement gap model of (17c).[25] Recall that this model asserts that if actual real wage increases over several recent years exceed labor's long-run expectations, then the volume of strikes should decline. The significant negative estimate for the $\sum_{i=1}^{5} \Delta R_{t-i}$ lag coefficients clearly supports the long-run expectations hypothesis, and suggests that labor has a "memory" extending many periods back through time in the sense that a change in real wages influences strike activity (negatively or positively) for several subsequent years.[26]

The level of unemployment (U_t) consistently displays a significant and sizable negative coefficient as hypothesized. This indicates that the strategic considerations outlined earlier govern labor's use of the strike and that strikes should be viewed as tactical weapons in struggles against management and not as poorly timed, spontaneous protests. Moreover, this relationship suggests that labor grievances are, as Rees[27] put it, "durable" or at least "semi-durable," and that industrial conflict therefore represents a rational translation of working class discontent into overt action.

The parameter for the rate of change in profit ratios (ΔC_t) is insignificant in all regressions. This probably reflects the contrasting effects attributed to profits earlier—increasing labor's demands and aggressiveness on the one hand, but decreasing capital's incentive to resist on the other. Thus, profits do not appear to have a very important influence on fluctuations in industrial conflict and the profit term should therefore be deleted from a revised model.[28]

Industrial Relations Systems and Strike Dynamics. The validity of previous conclusions concerning the impact of real wages, unemployment, and profit ratios on strike activity rests in part on the assumption that the structural coefficients are more or less constant through time and space. Although there is little reason to suspect systematic time-wise shifts in these coefficients during the postwar period, there is cause to question whether the parameters are equivalent cross-nationally, given the diversity of national institutional arrangements.

When considering the importance of institutional diversity in explaining cross-national differences in strike activity, industrial relations specialists have given great attention, not surprisingly, to contrasting systems of industrial relations. (Certain features of the political system are also considered important, but this is taken up later.) The usual argument is that centralized systems of collective bargaining, in which labor and management organizations impose real behavioral constraints on their respective clienteles (with or without government coordination), serve to diminish or contain the level of industrial conflict. As Ross and Hartman put it: "Just as unions in centralized systems eliminate improvident emotional gestures

posed by auto-correlated disturbances and lagged endogenous variables is provided in Douglas A. Hibbs, Jr., "Problems of Statistical Estimation and Casual Inference in Time-Series Regression Models," in *Sociological Methodology 1973–74, ed.* Herbert Costner (San Francisco: Jossey-Bass, Inc., 1974), pp. 252–308.

[25] The best fitting model was a second degree polynomial constrained to drop-off to zero after a five period lag. Similar results are reported by Ashenfelter and Johnson, "Bargaining Theory," and John H. Pencavel, "An Investigation into Industrial Strike Activity in Britain," *Economica,* 37 (August 1970), 239–256, for quarterly models of strike frequency in the United States and Great Britain respectively. The estimation technique used here was initially proposed by Shirley Almon, "The Distributed Lag." A comprehensive review of distributed lag formulations generally is given by Phoebus J. Dhrymes, *Distributed Lags: Problems of Estimation and Formulation* (San Francisco: Holden Day, 1971).

[26] A plot of the lag distribution coefficients is presented in a following section, after several additional hypotheses are incorporated into the strike volume model. The real wage data used here are average hourly earnings in the manufacturing sector deflated by the consumer price index. Movements in manufacturing wages are presumed to reflect closely economy-wide changes (cf. Orley Ashenfelter, George E. Johnson and John H. Pencavel, "Trade Unions and the Rate of Change of Money Wages in United States Manufacturing Industry," *The Review of Economic Studies,* 39 (January 1972: Appendix). Analyses using total annual employee compensation per civilian labor force member produced results virtually identical to those in Table 1.

[27] Albert Rees, "Industrial Conflict and Business Fluctuations."

[28] Although the profits result is theoretically plausible, the statistical insignificance of this variable may stem from excessive measurement error. Profits data are easily subjected to the artistry of corporate accountants, are well-known to be "hidden" as costs via accelerated depreciation tax laws, and are difficult to determine for unincorporated businesses. Furthermore, a significant fraction of the labor force in all economically advanced societies is employed in nonprofit activities. The profits-to-wages ratio is also correlated with real wages and unemployment. However, excessive colinearity is not a problem here: the multiple R^2 of profits/wages with the remaining independent variables is .17.

by the rank and file, likewise employer associations exclude reckless or primitive attitudes to which small businessmen in particular are subject. . . . The knowledge that any strike will be large and expensive serves as a deterrent to both sides. . . . Furthermore, employers within an industry do not have to worry about suffering a competitive disadvantage when all of them are subject to the same demands. . . . At the same time unions tend to be less aggressive since different branches are not competing to make the best showing within an indutsry."[29]

There is less than unanimous agreement, however, that centralized labor-management bargaining systems contain strike activity quite as effectively as Ross and Hartman and others have suggested. Malles, for example, expresses doubt as to whether "there is any correlation at all between a particular type of industrial relations system and the incidence of industrial warfare."[30] Sturmthal has even argued that highly centralized labor organizations and bargaining structures can lead to heightened grass roots unrest because of the "distance" created between the rank and file and the level at which decisions are made.[31]

Three modal types of collective bargaining systems are readily identified in the descriptive literature:[32]

(1) *Decentralized systems* characterized by firm-level bargaining (e.g., Canada, Japan, and the United States) or by anarchic labor-management relations embedded within a formal superstructure of multi-employer bargaining that imposes few constraints on the principal actors (France, Italy).

(2) *Centralized systems* typified by industry-wide bargaining or by multi-employer bargaining with industry-wide constraints (e.g., Belgium until 1959, the Netherlands after 1963, and the United Kingdom throughout most of the postwar period).

(3) *Highly centralized systems* within which economy-wide bargaining, or industry-wide bargaining with economy-wide constraints, prevails (e.g., Belgium after 1959, the Netherlands prior to 1964, Norway, and Sweden).

Simple calculation of strike volume means for each type of bargaining system leaves no doubt that during the postwar period the average level of strike activity covaried with the degree of centralization: mean man-days lost per 1000 wage and salary workers are 425, 172, and 67 for decentralized, centralized, and highly centralized systems, respectively. In this paper, however, interest is focused primarily on the stability of the structural (regression) coefficients of real wages, unemployment, and profits across these diverse systems of industrial relations. Recall that the most successful equation in Table 1 was the "long-run" expectations model of (17c):

$$(18)\quad SV_t = \beta_0' + \beta_1 \sum_{i=1}^{5} \mu_i \Delta R_{t-i} + \beta_2 U_t + \beta_3 \Delta C_t + \epsilon_t.$$

Let D_1 denote a binary or dummy variable equal to unity for centralized collective bargaining systems and equal to zero otherwise, and let D_2 denote a dummy variable equal to unity for highly centralized bargaining systems and zero otherwise. (Decentralized systems comprise the null case.) It is now possible to specify an alternative, unconstrained model that permits

[32] A great many studies were consulted in developing these categories. Among the most useful of those not already cited were: W. Albeda, "Recent Trends in Collective Bargaining in the Netherlands," *International Labour Review*, 103 (March 1971), 247–268; Robert F. Banks, "The Pattern of Collective Bargaining," chapter 3, *Industrial Relations: Contemporary Problems and Perspectives*, ed. Ben C. Roberts (London: Methuen and Co., Ltd. 1968); Roger Blanpain, "Recent Trends in Collective Bargaining in Belgium," *International Labour Review*, 104 (July–August 1971) 111–129; Donald E. Cullen, "Recent Trends in Collective Bargaining in the United States," *International Labour Review*, 105 (June 1972), 507–529; Yves Delamotte, "Recent Trends in Collective Bargaining in France," *International Labour Review*, 103 (April 1971), 351–377; Gino Giugni, "Recent Trends in Collective Bargaining in Italy," *International Labour Review*, 104 (October 1971), 307–328; Bruce W. Heady, "Trade Unions and National Wages Policies," *Journal of Politics*, 32 (1970), 407–439; Gunnar Hogberg, "Recent Trends in Collective Bargaining in Sweden," *International Labour Review*, 107 (March 1973), 223–238; David L. Horowitz, *The Italian Labor Movement*, (Cambridge: Harvard University Press, 1963); Val R. Lorwin, *The French Labor Movement* (Cambridge: Harvard University Press, 1954); Val R. Lorwin, "Labor Organizations and Politics in Belgium and France," in *National Labor Movements in the Postwar World*, ed. Everett Kassalow (Evanston: Northwestern University Press, 1963); Tadashi Mitsufuji and Hagisawa, "Recent Trends in Collective Bargaining in Japan," *International Labour Review*, 105 (February 1972), 135–153; Ben C. Roberts and Sheila Rothwell, "Recent Trends in Collective Bargaining in the United Kingdom," *International Labour Review*, 106 (December 1972), 543–571; and Adolf Sturmthal, *Contemporary Collective Bargaining in Seven Countries* (Ithaca, N.Y.: Cornell University Press 1957).

the parameters to vary across the three types of industrial relations systems. (The intercept-constant, β_0', already takes a unique value for each country and so is not affected by this respecification.)

$$(19)\quad SV_t = \beta_0' + \beta_1 \sum_{i=1}^{5} \mu_i \Delta R_{t-i} + \alpha_1 \sum_{i=1}^{5} \pi_i (\Delta R_{t-i} * D_1) + \gamma_1 \sum_{i=1}^{5} \omega_i (\Delta R_{t-i} * D_2) + \beta_2 U_t + \alpha_2 (U_t * D_1) + \gamma_2 (U_t * D_2) + \beta_3 \Delta C_t + \alpha_3 (\Delta C_t * D_1) + \gamma_3 (\Delta C_t * D_2) + \epsilon_t.$$

Table 2 reports the estimation results for the respecified long-run expectations model of (19). Clearly, these estimates lend support to the earlier presumption of parameter equivalence across contrasting industrial relations systems. More formally, the joint hypothesis that all coefficients are common across bargaining systems, i.e.,

$$\beta_1 \Sigma \mu_i = \alpha_1 \Sigma \pi_i = \gamma_1 \Sigma \omega_i$$
$$\beta_j = \alpha_j = \gamma_j \; (j = 2,3),$$

may be evaluated by computing the following F ratio:

$$F = \frac{[RSS_{(18)} - RSS_{(19)}]/r}{RSS_{(19)}/T - K},$$

where

RSS denotes the residual sum of squares in the respective equations,
r denotes the number of restrictions or constraints in (18), and
$T - K$ denotes the number of degrees of freedom of RSS (19).

Computation of this test statistic gives $F(8,113) = 0.9$, which is insignificant at any conventional level. Therefore, although the mean level of strike activity during the postwar period covaries strongly with the degree of centralization in collective bargaining, estimation of the unconstrained model yields results which do not challenge the earlier assumption that the structural parameters governing the impact of real wages, unemployment, and profits (the latter being of little importance) are approximately equivalent across institutionally diverse systems of industrial relations.[33]

The Money Illusion Hypothesis. In addition to the presumption of parameter equivalence, the analyses of previous sections also tacitly assumed that labor's propensity to strike is influenced by changes in real wages as opposed to changes in money wages. Therefore before incorporating certain features of the political system into the strike volume model it is important to dispose of the so-called "money illusion" thesis. The money illusion hypothesis holds that since movements in real wages are less perceptible than changes in money wages, working-class attention focuses largely on the latter, and hence workers are deceived by increases in money wages alone. Knowles's study of strikes in the United Kingdom, for example, concludes (albeit with considerable hesitancy): "Arguments based on the level of real wages are relatively unimportant at the level of strikes, even though they may have some importance at the level of negotiation, since (a) a rise in real wages is less evident and 'tangible' than a rise in money wages, and (b) a fall in real wages, even where it is immediately apparent, is less likely than is a cut in money wages to be taken as a deliberate act of the employers . . . and therefore is less likely to meet with immediate resistance."[34]

[33] Analogous tests for parameter stability were undertaken for equations (17a) and (17b), and for various other subsets of nation-year observations, but the results add little to what already has been reported.

[34] K. G. J. C. Knowles, *Strikes — A Study in Industrial Conflict* (1952), p. 227. The idea that workers

Sources: See Table 1.

Although it has been true historically that decreases in money wages have been vigorously resisted by labor, recent quantitative studies of postwar industrial conflict in Canada, Great Britain and the United States indicate that movements in prices and money wages act essentially as "mirror-images" with regard to strike activity.[35]

Since $\Delta R = \Delta W - \Delta P$[36]—where ΔR, ΔW and ΔP denote the percentage rate of change of real wages, money wages and prices, respectively—the money illusion hypothesis is tested simply by replacing $\Sigma \Delta R_{t-i}$ with $\Sigma \Delta W_{t-i}$ and $\Sigma \Delta P_{t-i}$ in a revised version of (17c). Accordingly we estimate the model (which omits the nonsignificant ΔC_t term)

$$(20) \qquad SV_t = \beta_0' + \beta_1 \sum_{i=1}^{5} \pi_i \Delta W_{t-i} + \beta_2 \sum_{i=1}^{5} \omega_i \Delta P_{t-i} + \beta_3 U_t + \epsilon_t.$$

Confirmation of the hypothesis requires that movements in money wages have a greater effect on strike activity than movements in prices, that is, the (negative) sum of the lag coefficients for ΔW_{t-i} should be significantly larger in absolute value than the corresponding (positive) sum of the ΔP_{t-i} lag coefficients. Table 3 reveals that if anything, just the reverse is true.

[a] The t-statistics for the regression coefficients are in parentheses. Constant terms vary by country and are omitted. Variables are defined in Table 1 and in the text.
Sources: See Table 1.

The difference, however, is neither theoretically nor statistically important; the standard F-test of the null hypothesis,

$$\beta_1 \Sigma \pi_i (\Delta W) = -\beta_2 \Sigma \omega_i (\Delta P),$$

yields $F(2,120) = .06$, which is insignificant at virtually any test level.

The evidence clearly demonstrates, then, that labor does not suffer from a money illusion, but, on the contrary, takes price changes as well as money wage changes fully into account in the use of the strike. This again suggests that strike activity is governed by a rational and rather sophisticated calculus.[37]

Strikes and the Political System. Beyond the economic factors appearing in the previous models, certain characteristics of the political system are also commonly believed to influence the magnitude of industrial conflict. The most important are the relative status in the political system of labor-oriented parties on the non-Communist left, the presence of governments controlled outright by Labor or Socialist parties, and the extent of Communist party influence in the labor force.

It has often been noted in comparative studies of industrial conflict that where Labor and Socialist parties are serious contenders for political power, the use of the strike weapon is restrained. The argument that Labor parties act to discourage worker militancy is well summarized by Ross and Hartman: "Why is labor political action a deterrent to strikes? First, strikes are injurious to the political fortunes of the labor party. Middle-class votes must be attracted if the party is to be successful, but the middle-class voter is antagonized by strikes. . . . Second, worker unrest is channeled off into the political sphere. Demands that would otherwise be made upon the employer are directed against the government instead."[38] There are numerous illustrations of this line of reasoning. For example, anticipating good prospects for a Labour Party victory in the British general elections of 1964, Harold Wilson urged railway union leaders in the spring of 1963 to prevent a

suffer from a money illusion apparently originated with John M. Keynes, *The General Theory of Employment, Interest and Money* (New York: Harcourt, Brace, Jovanovich, 1936).

[35] See Ashenfelter and Johnson, "Bargaining Theory"; Pencavel, "Strike Activity in Britain"; Vanderkamp, "Economic Activity and Strikes in Canada."

[36] Actually the continuous time equality $\frac{1}{W/P}\frac{d\,W/P}{dt} = \frac{1}{W}\frac{dW}{dt} - \frac{1}{P}\frac{dP}{dt}$ is only approximated by the discrete time relation $\Delta R = \Delta W - \Delta P$. However, for our purposes the difference is negligible.

[37] It is worth noting here that Kramer found percentage changes in prices and per capita monetary income to act as "mirror images" in their effects on fluctuations in the partisan division of the vote for the U.S. House of Representatives during the 1896–1964 period. Kramer interpreted this, quite properly, as evidence of rational mass electoral behavior. See Gerald Kramer, "Short-Term Fluctuations in U.S. Voting Behavior, 1896–1964, "*American Political Science Review*, 65 (March 1971), 131–143.

[38] Ross and Hartman, *Changing Patterns and Industrial Conflict*, p. 69.

scheduled work-stoppage because "such a strike would damage Labour severely in public eyes and jeopardize its position in the elections." *The New York Times* observed, "Fresh in every Labour politician's memory is the six-week London bus strike of 1958. The strike has been considered a major reason for Labour's overwhelming defeat by the Conservatives a year later."[39]

How might this argument be incorporated into a formal model of strike activity? First, an index is needed that permits specification of a plausible incentive function governing the inclination of Labor or Socialist parties to deter strike activity on the part of their constituencies. It would then be possible to evaluate the success of Labor-Socialist parties in actually diminishing the volume of strikes by relating the incentive function to the variable SV_t.

In terms of the theoretical argument briefly outlined above, the incentive of Labor-Socialist parties to discourage strikes in order to attract the middle-class votes deemed necessary for electoral success is likely to hinge on their competitive position in the party system. Following Przeworski and Sprague,[40] two things are assumed with regard to party competition: (1) the goal of party competition is electoral victory, and victory is defined as becoming the largest party; and (2) the goal is perceived in terms of the outcome of the last election. Victory, then, may be as little as ¼ of the vote in a multiparty system and greater than ½ the vote in a two-party system.

For simplicity, parties are classified in four political blocs or *tendances:* Communist, Non-Communist Labor-Socialist, Center, and Right. The competitive position of Labor-Socialist parties can now be defined as the difference or distance between their percentage vote share and that of the largest *tendance* in the system:

$$(21)\quad LD_t = \max(V_{t-1}) - LV_{t-1},$$

where: LD_t = Labor-Socialist % vote share distance
LV_{t-1} = Labor-Socialist % vote share in the preceding election
$\max(V_{t-1})$ = % vote share of the largest *tendance* in the preceding election.

It seems reasonable to suppose that the incentive of Labor-Socialist parties to dampen industrial conflict in hopes of attracting (or retaining) the marginal middle-class votes necessary to achieve (or maintain) plurality status in the party system would depend nonlinearly on their vote share distance (LD_t). Figure 3 depicts a likely form for this relationship. It suggests that the incentive (LI_t) should be very large when Labor's distance from its principal rival(s) in the party system (LD_t) is small or nil but should quickly decline (asymptotically approaching zero) as the distance increases. In other words, Labor-Socialist party elites have substantial motivation to restrain working-class

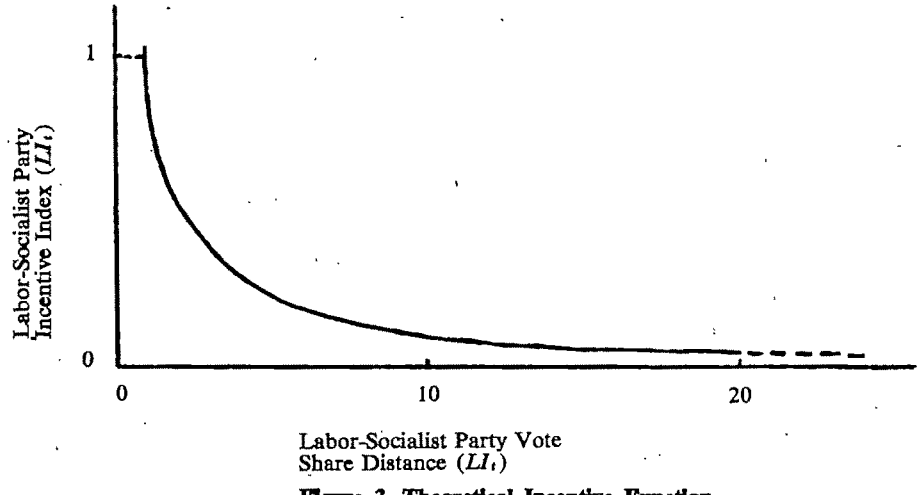

Figure 3. Theoretical Incentive Function

[39] Cited in Everett M. Kassalow, *Trade Unions and Industrial Relations: An International Comparison* (New York: Random House 1969), p. 52.

[40] Adam Przeworski and John Sprague, "Concepts in Search of Explicit Formulation: A Study in Measurement," *Midwest Journal of Political Science*, 15 (May 1971), 183–218.

militancy when electoral victory is very close at hand, but this incentive subsides rapidly with small increments in LD_t (especially at the lower ranges) given the risk of unnecessarily antagonizing hard core supporters or losing them to more radical competitors on the left. The most appropriate formalization of the model depicted in Figure 3 is a slightly modified reciprocal function. Accordingly, the Labor-Socialist Incentive index is defined:

$$(22) \qquad LI_t = 1 \text{ if } LD_t \leq 1$$
$$= LD^{-1} \text{ otherwise.}$$

Finally, the theory at hand seems best articulated by positing an inverse, linear relationship between the volume of strikes (SV_t) and the incentive index (LI_t):

$$(23) \qquad SV_t = f(LI_t, \ldots) \; f \text{ linear}$$
$$\partial SV_t/\partial LI_t < 0.$$

In conjunction with the decrease in strike activity ascribed to sharply competitive Labor-Socialist parties, an additional influence on working-class militancy is often attributed to the presence of Labor governments. It is argued that, other things being equal, workers, or at least union leaders, are much more reluctant to see a Labor or Socialist government embarrassed by severe strike activity than a Conservative one. Consequently, "if the labor party comes into power, the deterrent effect is even stronger. The trade union officials, having invested heavily in the party, are disinclined to do anything that would have the effect of sabotaging its program . . . and will show maximum restraint in the use of the strike."[41]

This hypothesis is evaluated straightforwardly by including in the model a Labor-Socialist Government dummy variable (LG_t) taking a value of unity when a Labor or Socialist party was in power and a value of zero otherwise. (Coalition governments were coded 1 only if Labor or Socialist parties had a plurality of key cabinet posts.) If workers as well as trade-union elites in fact respond to the partisan character of the government in the way that this argument suggests, strike activity should be lower during the tenure of Labor or Socialist administrations than it is during the tenure of Centrist or Rightist ones. Hence we have:

$$(24) \qquad SV_t = f(LI_t, LG_t, \ldots)$$
$$\partial SV_t/\partial LG_t < 0.$$

[41] Ross and Hartman, *Changing Patterns of Industrial Conflict*, p. 69.

The model or mini-model in (24) presumes that the effects of LI_t and LG_t operate continuously in time. Perhaps it is more plausible to assume that these influences are activated only in election years. Unions, for example, might make a real effort to minimize industrial conflict during the crucial election year period but are far less likely to relinquish the strike during the entire tenure of a Labor or Socialist administration. Similarly, party officials may find it infeasible (if not unnecessary) to attempt to discourage strikes in nonelection years no matter how close they are to "victory." These qualifications suggest revising (24) such that

$$(25) \qquad SV_t = f(LI_t{}^*E_t, LG_t{}^*E_t, \ldots),$$

where E_t is a dummy variable equal to unity in the year preceding an election and zero otherwise. The specification in (25) therefore constrains the effects of the Labor-Socialist Incentive index (LI_t) and Labor-Socialist Governments (LG_t) to be zero in nonelection years.

Finally, the strike model should also incorporate a term representing Communist party influence in the labor force. Communist parties in most advanced industrial societies are of course no longer revolutionary in the traditional Marxist sense. Indeed the French and Italian parties and their union affiliates (by far the largest in Europe) have in recent years exhibited caution, if not moderation, in the use of the strike and related protest activities in order to avoid unnecessarily alienating less radical or militant segments of society.[42] However, despite the significant tactical variations exhibited by Communist movements during the postwar period in confronting dynamic sociopolitical environments, it seems clear that in contrast to other major political actors in industrial societies of the West, Communist parties remain important agencies for the mobilization of discontent and the crystallization of labor-capital cleavages. Presuming that there is nearly always a certain reservoir of latent grievance or discontent which is not manifested in overt conflict unless mobilized and channeled by radical agencies on the left, it is anticipated that sizable Communist parties will have a systematic impact on strike activity beyond that attributable to the economic variables considered previously and opposite to that of Labor parties and Labor governments.

[42] See Donald L. M. Blackmer, "Italian Communism: Strategy for the 1970's," *Problems of Communism*, 21 (May–June 1972), 41–56, and George Ross, "French Working Class Politics After May–June 1968: A New Working Class?", Paper delivered at the 1973 Annual Meeting of the American Political Science Association, New Orleans, Louisiana, September, 1973.

Using Communist party membership as a fraction of the civilian labor force (CP_t) to index the relative extent of Communist organizational mobilization, the preceding discussion suggests the function

$$SV_t = f(CP_t, \ldots) \qquad (26)$$
$$\partial SV_t/\partial CP_t > 0.$$

The precise form of (26) is unspecified; it is unlikely that a conventional linear formulation will adequately capture the response of strike activity to variations in Communist membership. In particular, a plausible argument can be made that Communist parties cannot effectively mobilize labor discontent and thereby influence industrial conflict appreciably unless membership size (relative to the total work force) reaches a certain "critical mass" or threshold. Increments in CP_t above the critical threshold might lead to substantial increases in industrial conflict until an upper bound or "grievance exhaustion" point is reached beyond which further growth in party size has little or no additional effect on strike activity. A nonlinear relationship of this sort is shown in Figure 4 and is given formally by the function

$$SV_t = e^{\alpha - \lambda/CP_t}. \qquad (27)$$

To recapitulate: Figure 4 and Equation (27) simply articulate the idea that beyond some initial threshold, strike activity moves rapidly upward with increases in Communist party size (the rate of response being greatest at the point of inflection $\lambda/2$) but then levels off, asymptotically approaching an upper bound or grievance exhaustion level e^{α}.

Combining the political hypotheses of this section with the most successful economic model developed previously yields the following equation for the volume of strikes:

$$SV_t = \beta_0' + \beta_1 \sum_{i=1}^{5} \mu_i \Delta R_{t-i} + \beta_2 U_t + \beta_3 LI_t{}^* E_t + \beta_4 LG_t{}^* E_t + e^{\alpha - \lambda/CP_t} + \epsilon_t \qquad (28)$$
$$\beta \Sigma \mu_i < 0, \beta_2 < 0, \beta_3 < 0, \beta_4 < 0,$$
$$\alpha > 0, \lambda > 0.$$

Table 4 reports the estimation results for three versions of the basic model in (28). Clearly, both the Labor-Socialist Incentive index (LI_t) and the Labor-Socialist Government dummy (LG_t) exhibit negligible influence on strike activity. The estimated coefficients of these variables oscillate in sign across specifications and the t-statistics are inignificant at any conventional test level. Moreover, this is true whether the hypothesized (negative) effects are permitted to operate in all years (28a) or are restricted to election years only (28b).

Interpretation of the Labor government (LG_t) result is straightforward: during the postwar period left-wing governments have been no more successful than center or right-wing governments in discouraging short-run upward

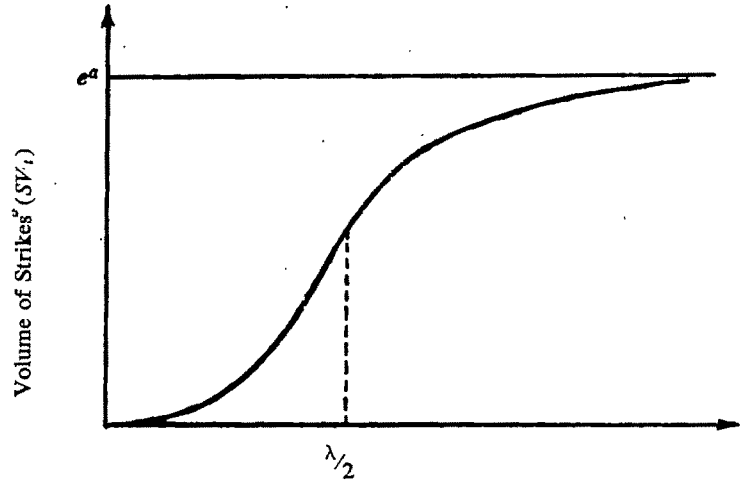

Figure 4. Hypothetical Relationship of Communist Party Membership and the Volume of Strikes

[a] The t-statistics for the regression coefficient estimates are in parentheses. Constant terms vary by country and are omitted. ΔR and U_t are defined in Table 1. LI_t denotes the Labor-Socialist Party Incentive index and equals unity when LD_t is ≤ 1 and LD_{t-1} otherwise, where LD_t = max vote share minus the Labor-Socialist vote share. LG_t and E_t are Labor Socialist Government and Election year dummy variables, respectively. CP_t is Communist Party membership per 1000 civilian workers.

Sources: Electoral data and Communist party membership data are primarily from U. S. Department of State, Bureau of Intelligence and Research, *World Strength of Communist Party Organizations,* annual volumes 1950-1970. See Table 1 for the sources of other variables.

movements in strike activity, notwithstanding the electoral ties of the former to the working-class.[43] From the workers' point of view, the correspondence of interests with Socialist party elites is simply less than perfect. As Ernest Bevin put it when leading the strikes of dock and tramway workers in Britain just after the first Labour government came into office in 1923: "There is work to do in the industrial field as well as in the political arena. While it is true that the two are to some extent part of the same effort, we must not lose sight of the fact that governments may come and governments may go, but the workers' fight for betterment of conditions must go on all the time."[44] Subsequent Labour government leaders have been no more effective in deterring labor militancy and strikes than the first Labour Prime Minister Ramsay MacDonald.

The implication of the Incentive index (LI_t) result, unlike that of the Labor government dummy variable outcome, is not unambiguous For example, it is possible that the incentive function presented in Figure 3 and in Equation (22) is poorly specified, or that its definition in terms of vote share distances in (21) is too simple. However, alternatives to the incentive function developed in the text, elaborations of the basic specification in (24), and analyses permitting the coefficients to vary across subsets of countries produced results no better than those reported in Table 4.[45] Thus, it is plausible that Labor-Socialist party attempts to discourage strike activity are indeed governed by a model akin to that outlined previously, but that

[43] Similar conclusions with regard to Great Britain are reached by John E. T. Eldridge, *Industrial Disputes: Essays in the Sociology of Industrial Relations* (London: Routledge & Kegan Paul, 1968); and Herbert A. Turner, *The Trend of Strikes* (Leeds: Leeds University Press, 1963). It should be understood that the results associated with the political party terms apply only to nations experiencing oscilliations in Labor-Socialist rule. The effects of long-term leftist rule on labor militancy (e.g., in Sweden, Norway and Denmark where the Left has governed almost continuously during the postwar period) are absorbed by the country-specific constant terms. The consequences of such long-standing political and institutional differences are discussed in great detail in my paper "Long-Run Trends in Strike Activity in Comparative Perspective."

[44] Cited in Kassalow, *Trade Unions and Industrial Relations,* p. 50.

[45] Several of these alternatives are worth mentioning. First, since the translation of electoral votes into legislative seats is by no means direct [see Douglas W. Rae, *The Political Consequences of Electoral Laws* (New Haven: Yale University Press, revised edition, 1971), for an exhaustive analysis], the incentive function of Labor-Socialist Party elites in (22) was also defined in terms of seat shares as opposed to vote shares. Second, Equation (23) was revised to incorporate the capability as well as the motivation of party elites to discourage strike activity; where capability was measured in terms of the size of the Labor-Socialist political constituency (voters). Third, the Labor-Socialist vote share distance in (21), as well as the seat share variant described in the first point above, was modified to include (a) the vote or seat share of the U.S. Democratic party — following Greenstone's argument [J. David Greenstone, *Labor in American Politics* (New York: Alfred A. Knopf, 1969] that American labor and the Democrats have become interpenetrated in a way that is at least partially equivalent to party-union alliances in much of Western Europe — and, (b) the vote or seat share of the French Communist Party (PCF) during the period of the left alliance. As noted in the text, none of these modifications led to empirical outcomes significantly different from those reported in Table 4.

such attempts, on the whole, have been unsuccessful.

This apparent failure of party elites to reduce the use of the strike may stem less from the unresponsiveness or "irresponsibility" of top union leadership than from the fundamental radicalism and militancy of the rank-and-file. In Great Britain, where there is a close, organic relationship between trade union and Labour party elites, the vast majority of strikes during the last decade have been unsanctioned, "illegal" conflicts typically led by left-wing shop steward militants.[46] Although the British case is probably the best documented, wildcat strikes, contract rejections and other manifestations of grass-roots rebelliousness have also become serious issues in Canada, the United States, and continental Europe.[47] Strikes, then, not only are weapons in disputes with private capital, but can also serve as instruments of rank and file rebellion against union authority, and in some situations, state authority. Hence, the conclusions of Ross and Hartman's influential study that "labor political action, labor parties, and labor governments have helped pave the way toward renunciation of the strike," and that political action is "more in line with the middle-class orientation of workers in advanced industrial societies,"[48] seem to be seriously at odds with the empirical data.

Although the results in Table 4 give no evidence in favor of arguments concerning the impact of Labor-Socialist parties and governments on short-run fluctuations in strike activity, they do substantiate the anticipated effect of Communist party influence in the labor force. The initial specification of a "critical mass"/"grievance exhaustion" model represented by the function $SV_t = e^{\alpha - \lambda/CP_t}, \ldots,$ however, produced coefficient estimates that were statistically insignificant, unstable in sign, and unreasonable in magnitude. (A standard nonlinear algorithm in conjuction with reasonable initial parameter guesses was used.) An alternative, unbounded exponential function of the form $SV_t = e^{\alpha CP_t} \ldots,$ which preserves the idea that strike activity should increase (decrease) rapidly and nonlinearly with growth (decline) in Communist mobilization, proved to be far more successful in describing the relationship of industrial conflict to Communist membership over the range of variation observed in the latter variable in this body of data. The highly significant estimates[49] for this revised exponential model (reported throughout Table 4) support the original proposition that sizable Communist parties are associated with levels of industrial conflict that cannot be attributed to such economic factors as changing rates of increase in real wages ($\Sigma \Delta R_{t-i}$) or fluctuations in the demand for labor (U_t).

Conclusions

The evidence developed in this study supports several tentative conclusions. Time plots of the volume of strikes presented in the first section indicate that arguments about the withering away of industrial conflict and related statements concerning the vitiation of labor militancy in advanced industrial societies are not compatible with the empirical data. There simply is no sign of a general downward movement in the aggregate volume of strikes during the 1950–1969 period. To push the implications of this a bit further and in a more general direction, the trends in strike activity tend to complement other streams of evidence contradicting macrosociological arguments about the "integration" of labor in advanced capitalist

[46] J. F. B. Goodman, "Strikes in the United Kingdom: Recent Statistics and Trends," *International Labour Review*, 95 (May 1967), 465–481; and Michael Silver, "Recent British Strike Trends: A Factual Analysis," *British Journal of Industrial Relations*, 11 (March 1973), 66–104. The situation was reversed, however, after the passage of the Industrial Relations Act of 1971, which was bitterly resented by the British trade union establishment and which stimulated the normally moderate Trades Union Congress (the peak union organization) to join the shop stewards in pressing the militant position. Consequently, nearly 80 per cent of the man-days lost in strike activity in the years after 1971 were due to "official" disputes. A detailed analysis is given by Gerald Dorfman, "An End to Producer Group Politics in Britain?: The Industrial Relations Act of 1971," paper delivered at The 1973 Annual Meeting of the American Political Science Association, New Orleans, Louisiana, September, 1973. The dynamics underlying differential responsiveness of union leadership and the rank-and-file to the wider political interests of Labor-Socialist parties is of course an important problem, which the simple models developed here cannot address with any authority.

[47] See John S. Greenbaum, "The Rebellious Rank and File," *Personnel*, 49 (March–April 1972), 20–25; Stuart M. Jamieson, *Times of Troubles Labour Unrest and Industrial Conflict in Canada, 1900–66*, (Ottawa: Economic Council, Task Force on Labour Relations, 1968); Seidman, *Trade Union Government and Collective Bargaining;* and Stanley Weir, "Rebellion in American Labor's Rank and File," in *Workers' Control*, ed. Gary Hunnius, G. David Garson and John Case (New York: Vintage Books 1973).

[48] Ross and Hartman, *Changing Patterns of Industrial Conflict*, p. 58.

[49] The *t*-statistics in this nonlinear model should be interpreted with caution since strictly speaking they have meaning only in terms of the linearized equation at the solution point. There is no question, however, that the exponential form given in Table 4 outperforms all reasonable alternative functions.

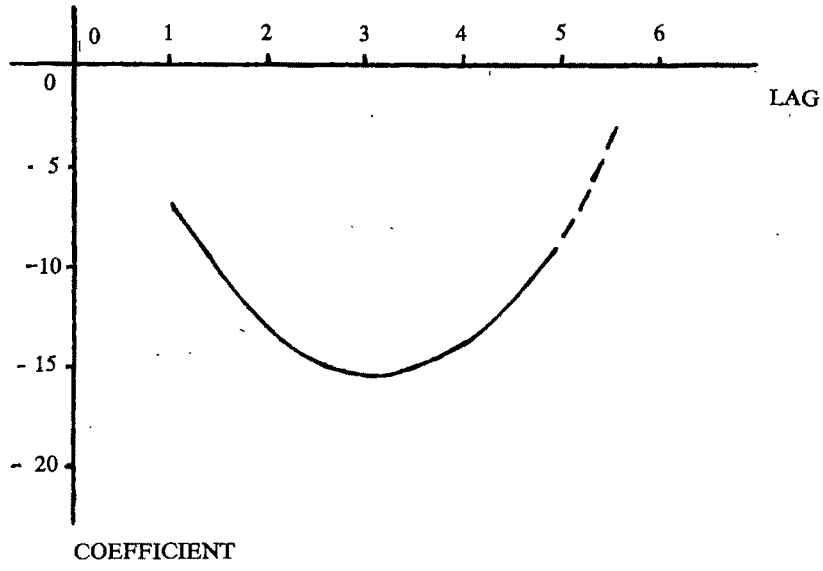

Figure 5: Distribution of Real Wage Lag Coefficients (from Table 4, 28c)

societies and the *embourgeoisement* of workers in the face of unprecedented affluence.

Patterns in the fluctuation of industrial conflict also suggest that the working class exercises considerable sophistication in the use of the strike weapon. The pronounced inverse relationship between the volume of industrial conflict and the rate of unemployment demonstrates that on the whole strikes are timed to capitalize on the strategic advantages of a tight labor market. What Hobsbawm has called "the common sense of demanding concessions when conditions are favorable" indeed seems to prevail.[50] Moreover, labor does not appear to be misled by a "money illusion." The empirical results clearly show that price changes are no less important than money wage changes in their effects on strike activity. Industrial conflict therefore responds to movements in real wages rather than money wages, which is further and rather persuasive evidence that rational behavior underlies observed strike fluctuations.

The real wage function that proved to be most successful empirically was a polynomial distributed lag in $\sum_{i=1}^{5} \Delta R_{t-i}$ (graphed in Figure 5). The general form of this lag distribution was deduced from a formal specification of a "long-run" expectations variant of the basic expectation-achievement hypothesis, although the lag function does not depend in any essential way on this particular theoretical rationalization. Without becoming very firmly attached to the precise shape or exact coefficient values of this lag distribution,[51] it can be said that labor militancy appears to be governed, in part, by a "memory" persisting several periods back through time, in the sense that a change in real wages affects strike activity over a number of subsequent years. More specifically, the estimates indicate that an equilibrium reduction of 1 per cent in the rate of change of real wages is associated with a strike volume increase on the order of 59 man-days lost per 1000 workers, which is distributed nonlinearly over about 5 periods.

Finally, the analyses in the last section of the paper reveal that Labor-Socialist party elites are, on the whole, unable to deter short-run

[50] E. J. Hobsbawm, "Economic Fluctuations and Some Social Movements Since 1800," *Economic History Review*, Second Series, 5 (1952), 1–25.

[51] Since the real wages variable is undoubtedly measured with significant error, one should not place great confidence in the exact values of the individual lag coefficients or in the lag distribution. This follows from the results of a recent paper by Grether and Maddala which shows that measurement error in an exogenous variable typically leads to the appearance of a *longer* lag distribution than is actually the case, but at the same time produces a *better* estimate of the total response. In the case at hand, this means the $\beta_1 \Sigma \mu_i = -59.2$ in (28c) of Table 4 is probably a good estimate of the total response of SV_t to $\Sigma \Delta R_{t-1}$ (the total multiplier), although the lag distribution index $i = 1 \ldots 5$ may be too long. See David Grether and G. S. Maddala, "Errors in Variables and Serially Correlated Disturbances in Distributed Lag Models," *Econometrica*, 41 (March 1973), 255–262.

increases in strike activity despite their strong incentive to do so (especially when the prospects of electoral victory are good) and notwithstanding their political ties to organized labor. Similarly, industrial conflict exhibits no consistent tendency to drop-off during the tenure of governments controlled by Labor or Socialist parties. The empirical evidence for the postwar period suggests, therefore, that left-wing parties and governments relying upon symbolic, electorally expedient appeals to political solidarity, which are not accompanied by tangible rewards to labor (wages, hours, fringe benefits and so on), have had little success in discouraging working-class militancy. In contrast, strike activity does appear to vary (nonlinearly) with the relative size of Communist party membership. This lends support to the earlier proposition that Communist parties in advanced industrial societies remain important agencies for the mobilization of latent discontent and the crystallization of labor-capital cleavages.

Extensions of the simple single-equation strike models presented in this study have obvious implications for public policy. One of the most important problems confronting industrial nations during the postwar period is the trade-off that appears to exist between unemployment and the rate of wage-price inflation (the so-called Phillips curve). If labor militancy or strike activity in the current period influences wage movements in current and subsequent periods independently of market conditions, then this implies a lagged reciprocity between strikes and wage changes, and more important, means that strike activity affects, perhaps crucially, the unemployment-inflation dilemma. This seems clear enough intuitively, although conventional economic formulations of the problem rarely consider labor aggressiveness explicitly.[52] In any case, an adequate treatment of the economic and political dimensions of these linkages would extend this paper far beyond its present length and requires empirical analyses not yet completed.

[52] The work of Hines and Ashenfelter et al., are important exceptions to the restrictive treatment of the employment-inflation problem found in the bulk of the empirical economic studies. See A. G. Hines, "Trade Unions and Wage Inflation in the United Kingdom 1893–1961," *Review of Economic Studies*, 31 (October 1964), 221–252; and Orley Ashenfelter, George E. Johnson and John H. Pencavel, "Trade Unions and the Rate of Change of Money Wages in United States Manufacturing Industry," *The Review of Economic Studies*, 39 (January 1972), 27–54. Also, see my forthcoming paper "Labor Militancy and Wage Inflation: A Comparative Analysis."

The Political Psychology of Religion in Plato's *Laws*

THOMAS L. PANGLE
Yale University

Introduction

Why is it important that we turn our serious attention to Plato's *Laws?* How will the study of this antique work help us to come to grips with the dilemma of modern democracy? We find ourselves citizens of rich and powerful regimes which administer enormously dynamic societies; yet the accelerating pace of change, the increasing sense of motion, go together with a dramatically decreasing sense of purpose and direction. We can openly wonder what our prosperity and freedom are for. What kinds of men and women, what ways of life, are intended to be the "users" of this liberty and wealth? Given the predominance in the twentieth century West of a version of liberalism which seeks to relegate such questions of purpose to the subpolitical sphere of private or "social" decision, it is not surprising to find, in reaction to the quandary, considerable speculation about alternatives to liberal democracy. But speculation of this kind is not, or should not be, limited to partisans of revolutionary change. In fact, this speculation is the proper task of political philosophy, which is almost by definition nonpartisan. The investigation of alternatives—the reflection on the merits, the strengths and weaknesses, the possible future improvements or dangers of contemporary democracy — will be productive of real political knowledge only if it is conducted in a spirit not of commitment but of open-minded and imaginative intellectual experimentation. We wonder about human needs, political, social, or personal, that may be frustrated or even unknown in the contemporary political universe. And yet prior to the investigation itself we have no way of knowing whether these needs can be answered in the modern context without risking even greater dissatisfactions. It may be that the philosophic inquiry into alternatives may only make clearer the essential limits of all political aspiration in modern, technological mass society. On the other hand, it is likely that such investigation will lead to some improvement in our understanding of the best direction in which to move to secure at least small improvements in our public life.

If we decide to undertake a serious inquiry into republican alternatives to liberalism we are led necessarily toward historical studies, for these alone expose us to the full range of republicanism—a range that extends far beyond the bounds of present-day varieties of liberal, plebescitarian, and Marxist systems. Now perhaps the most appealing of historical republican regimes, the one which has attracted admirers in almost every generation, is the classical city. It is easy to entertain the suspicion that in some *poleis* men had experiences and exercised capacities whose lack in our social lives today underlies a good part of our frustration and purposelessness. Still, the very suspicion that stimulates our intense interest may cloud our vision. In our desire to find a concrete embodiment of what we feel to be missing from our public life we are too prone to brush aside those elements of the *polis* which we find immediately unattractive. Yet the features that seem most alien may be so only because they are unintelligible to us; and their lack of intelligibility may be the surest sign that these are the elements of political life which we have lost sight of. In meditating on things that the classical theorists praise and that we find repugnant, we may discover politically relevant aspects of the soul, needs of the soul, which are now only dimly visible to us.

It is in the light of these considerations that we turn to a study of the Platonic dialogue which contains the most detailed classical presentation of the best city. I believe the chief reason why the *Laws* is so rarely studied by political scientists, and that when studied it seems so alien, is the emphasis on the gods and "religion" which pervades the work. The laws put forward by Plato's chief interlocutor (an old "Athenian stranger") are surely not revealed by god; but, just as surely, they are proposed with an eye to god at all times. The *Laws* is the only Platonic work that literally begins with the word "god." The occasion of the dialogue is a pilgrimage made by three old men to a sacred cave, and the conversation seems to take the place of the homage to the god of the cave (see 625a, 643a).[1] To extend this contrast with the *Republic,* one may say figuratively that in the *Laws* Cephalus never leaves and that his sons arrive only in the tenth

[1] Unless otherwise indicated, numerical references are to the standard Stephanus pagination of Plato's *Laws* and other dialogues. All translations are my own. I have used the edition of John Burnet, *Platonis Opera,* 5 vols. (Oxford: Clarendon Press, 1907).

book. The more one reads the *Laws* the more one is tempted to think that for Plato political science and a kind of theology are inseparable.[2] The full significance of this for us becomes apparent when we contrast the attitude toward religion held by the philosophic sources of modern republican theory. Whether one thinks of the first wave of modern theory (Spinoza, Locke, Montesquieu) or of the second (Kant, Hegel, Marx), it is apparent that the "theological-political problem," or, to speak practically, the reduction of religious influence on politics, is considered to be the key preliminary task of political science. It is true that both the thinkers who founded and those who radicalized the Enlightenment directed their critique mainly against Judaeo-Christian political theology; it is also true that they often used the Greek and Roman philosophers as allies in their struggle against the "Kingdom of Darkness." And they were correct to the extent that they detected a greater concern for politics in pagan reflections on the relation between politics and religion. But we need not rely on Fustel de Coulanges, we need only peruse with care the classical texts themselves, to see that the enlightenment separation between theology and political theory is in the final analysis directed against classical as well as against medieval or Biblical thought.

Plato no less than Thomas denies the modern thesis which holds that political life becomes more healthy when citizens are "liberated" from the "myths" of religion. But why does he do so? Plato's reasons are surely not the same as the Christian reasons, nor even the same as Rousseau's,[3] though all may share some common ground. A more satisfactory way of asking for Plato's reasons is to ask for his explanation of what he would understand to be the best relation between religion and politics. Now this is precisely what Plato attempts to give through the dramatic exchange he presents in the tenth book of the *Laws*. By meticulous attention to the drama of this section we can hope to bring to light Plato's reasons (psychological, political, suprapolitical) for what is to us perhaps the strangest feature of his political theory. In accomplishing this we may even be introduced to a new way of approaching some of the greatest political ills of our century, for if Plato is right, all modern thought has overlooked or distorted an absolutely essential dimension of political life.

Given the importance of the theme of Book Ten for our acceptance or rejection of the teaching in the *Laws* as a whole, and given the fact that Klinias himself, the prospective legislator, calls the discussion in Book Ten "the best prelude to all the laws" (887c1), it is not inappropriate to begin by virtually ignoring the first nine books. Nonetheless, we must give some consideration to the immediate context. The Athenian gives his defense of "civil religion" near the end of his elaboration of the penal code — a rather odd place, it may seem at first sight, for Plato's most extensive treatment of theology.[4] But the context is in fact one of the keys to the interpretation of the theology: the primary function of the three proofs in Book Ten is the support of the penal code. In Book Nine it had been frequently noted that penal law is effective only if the criminal is caught. But magistrates cannot look into the hearts of men, and therefore cannot detect all crime (not to speak of the possibility that they may punish the innocent). If the potential criminals are to be properly fearful and if the citizens are to believe the penal code is truly just, there must exist divine sanctions in this life or after death.[5] Book Ten's central proof is the proof that a Hades exists where the gods punish the unjust. The further "psychological" implication of this punitive character of the theology will emerge presently.

For now it is more important to note that the Athenian's interest here goes beyond the prevention of crime in the general populace. He focuses on a minority, the impious and hubristic young. He almost brings these rebels to life, and by speaking through them creates a dialogue within the dialogue whose only participants thus far have been the very old. The Athenian's theology seems meant to redeem the young whose minds have been corrupted by impiety. Their impiety is of three types, based on three erroneous opinions: 1) the gods

[2] Avicenna goes so far as to say that the *Laws* is a work on prophecy: *On the Divisions of the Rational Sciences*, in Ralph Lerner and Muhsin Mahdi, eds., *Medieval Political Philosophy, A Sourcebook* (Glencoe, Illinois: The Free Press, 1963), p. 97.

[3] I have tried to bring out the difference between Rousseau's treatment of "civil religion" in the *Social Contract* and Plato's in the *Laws* in "Politics and Religion in Plato's *Laws*: Some Preliminary Reflections," in *Essays in Arts and Science, III* (1974), 19–28.

[4] According to Vanhoutte, the peculiarity of the context is one convincing sign that Plato failed to revise properly this work: Maurice Vanhoutte, *La philosophie politique de Platon dans les "Lois"* (Louvain: Publications Universitaires de Louvain, 1954), p. 17.

[5] See 865d, 870e, 871b, 872, 874, 880–1, 913d, 917a–d, 931e, 958d–959e; cf. Jules Simon, *Etude sur la theodicée de Platon et d'Aristote* (Paris: Joubert, 1840), p. 269, and Victor Martin, "Sur la condamnation des athées par Platon au Xe Livre des Lois," *Studia Philosophica* II (1951), 105–6.

do not exist; 2) the gods exist but have no care for men; 3) the gods exist, have a care for men, and are bribable (885b6–9). From this threefold distinction the plan of Book Ten emerges as the Athenian refutes each of these beliefs, in this order. Prior to the first refutation, however, there is a section devoted to removing certain obstacles which stand in the way of any argumentation about the gods.

Prolegomena to the Refutation of the Atheists

885c1–886a5: The Abandonment of Zeus. Having heard the Athenian introduce the young upstarts in a fitting tone of disrespect, the old Cretan statesman Klinias breaks a silence of nine pages (876a–885c) to ask indignantly what should be "done or even said to them." The Athenian replies with a soothing term of address, requesting that they first listen to what he "prophesies" the "joking and contemptuous" young men might say. He presents the young men addressing the old men as "strangers," calmly reminding Klinias that they are not now sitting in judgment. The young men demand to be convinced by reasonable persuasion, and ascribe their delinquency to the influence of the best poets, orators, prophets, and priests, who all teach that the gods can be bribed. Gingerly, without uttering a word in his own name, the Athenian has reminded Klinias of the enormous difficulties in all the traditional theological authorities.[6] At the same time, we begin to realize that the Athenian intends to teach us his own art of theological rhetoric; could it be that his real theological adversaries are not the young rebels but the old guard?

In this second characterization the Athenian has described the impious as mostly young men with unjust desires and no well-developed theories (he is silent about the group who hold the central opinion — see 899d6ff). Klinias is in consequence rather scornful and offers to prove the gods' existence. But he abandons without a struggle the defense of the Homeric gods and bases his proof instead on the earth and sun and other stars and the natural orderliness of such things. Klinias is thus induced to set the tone of Book Ten: except for two oaths "by Zeus," the name of an Olympian god is never mentioned (891c7, 895d1; cf. 904e4). Although he probably recalls what the Athenian said earlier about the divine orderliness of the heavens and even the "planets" (820aff.), his refraining from mentioning the Olympian gods need not stem from "philosophy" or even from disbelief in the Olympians. As Klinias here indicates, when a prudent man of any nation is called upon to demonstrate the existence of the gods he turns to the visible order and visible "highest things." The reasonableness of this step causes a kind of unanimity among all peoples and the unanimity reinforces the appearance of reasonableness.[7] The natural theology of the astral gods emerges from the common sense of the nonphilosopher.[8]

886a6–887c4: The "Apology of the City." The Athenian stranger next startles Klinias with the first of several surprises. Contrary to the impression he originally gave, he begins to express respect for the arguments of the impious and denies that their motives are all base. Klinias suddenly is told that his ignorance of certain books familiar to all Athenians has led him to underestimate the profound reasonings which support the point of view of the impious young — reasonings which Klinias has unwittingly committed himself to refuting. Since the Athenian praises here the "virtue of the regimes" which make Spartans and Cretans ignorant of the strong arguments for atheism (886a11), we are forced to wonder why he introduces these corrupting arguments into the code of laws for the new Cretan regime. The Athenian seems to be the corrupter of the young as well as their redeemer (cf. 680c and 634d-e). The Athenian's civil theology is meant to defend the opinions necessary for dedication to good citizenship; but he is willing to risk

[6] Cf. 636d, 886c, 941.

[7] Compare 887e2–7, *Apology of Socrates* 26d, *Cratylus* 397d, *Epinomis* 987a; Cicero, *De Natura Deorum* II ii; Aristophanes, *Peace* 406; and above all *Deuteronomy* 4:19. See also Edwin Bourdieu England, *The Laws of Plato*, 2 vols. (Manchester: University Press, 1921), at 887e2. William Guthrie's discussion suffers from his failure to consider these passages in the *Laws* as well as the passage cited from the *Apology*: see *The Greeks and Their Gods* (Boston: Beacon Press, 1955), pp. 211–14.

[8] Space does not permit us to do more than note the absence in Klinias's proof of all sense of the uncanny, the mysterious, the *holy* — what Rudolph Otto called the "numinous." This absence characterizes Book Ten as a whole. We must leave open the question whether the absence indicates a flaw in Plato's attempt to understand the "religious experience" and all that it implies for politics. An answer would require, among other things, coherent reflection on the contrast between "the holy" and what Plato's Socrates speaks of as the "daemonic" (cf. 885c3). The first steps in such reflection are prepared by Otto's discussion of Goethe's notion of the daemonic: *The Idea of the Holy*, trans. John Harvey (London: Oxford University Press [1950], 1972), pp. 150ff. Consider here Gershom Scholem, *On The Kabbalah and Its Symbolism* (New York: Schocken Books, 1965), pp. 88ff.; and Hans Jonas, *The Gnostic Religion* (Boston: Beacon Press, 1963), chapter 10, especially pp. 250-5.

weakening that defense in order to move the city's opinions in the direction of truth. The wise fathers who rule the city, men with natures like Klinias' and Megillus', cannot face such a challenge without gradual and extensive preparation. The long introduction to the arguments themselves is in part the model of such preparation — a model that future young citizens with natures like the Athenian's must listen to and learn to follow.

The most serious writings which stand behind the impious young "Athenians" belong not to ancient poets but to "new and wise" men who assert that the heavenly bodies are mere stone and earth. These men and their pupils do not of course imply that the gods are bribable. We have almost insensibly left behind "most" of the impious young (cf. 885e) and have had our attention turned to a small minority of radical atheists. Confronted with this opposition Klinias understandably expresses some dismay.

So at this point the pious old Athenian raises for the first time the suggestion that they give up. He asks whether they should defend themselves (*apologeomai*) in court against the atheists' accusation that they, as representatives of the city, are doing "terrible things" or whether they should simply institute penalties without further ado. This way of putting it gives the impression that the atheists speak from a position of moral or even legal superiority. The Athenian mentions only *one* problem in continuing: the discussion will have to be rather long. He has presented the situation in a way calculated to make Klinias urge him to continue — to continue with the "apology of the city" before the tribunal of the "wise" and their students.[9]

By expressing reservations about the length of the speech required the Athenian induces Klinias to remind them all vigorously of the agreed-on form for the preludes — lengthy, reasonable persuasion suitable for free men rather than curt speech (mere law) fit for slaves (719c–723d, 857d). He goes on to portray with passion the political need for belief in gods; he mentions "persuasion" twice but no longer "the truth."[10] It is this pious passion that the Athenian is ready to confront and attempt to subdue.

887c5–888d6: "Thumos." Instead of proceeding with his proofs, the Athenian, in his longest speech in all Book Ten, pleads for moderation in both the old and the young men. The greater part of this speech is a very sympathetic suggestion that the older men moderate their "*thumos*." (*Thumos* means primarily anger or, more broadly, "spiritedness": 717d, 731aff., 863b, 866d, 934d.) After noting that Klinias has spoken with such eager spirit (*prothumōs*) as to seem to call for prayer, the Athenian asks them to consider how they might speak without *thumos* (*mē thumō* — 887c7; *athumos* — 888a5), quenching *thumos* (*sbesantes ton thumon* — 888a6).[11] He thus indicates that the greatest obstacle to "dialogue" (888a6) about gods is *thumos*. His anxious concern seems to point to *thumos* as the core of what we would call "religious zeal." It appears that the prolegomena to the refutation of the atheists is more than a model of theological rhetoric: it is an exploration through drama of the psychological reasons why such rhetoric is necessary.

Why does the Athenian stranger imply that *thumos* is that element in the soul which is at the root of religious zeal? How and why can Plato's "psychology of religion" trace the root of religious passion to anger or *thumos*? Let us begin by thinking of what anger looks to as its goal, namely, punishment, and recall our remarks about the context of this theology. Keeping in mind the present passage, we realize that the fact the gods are invoked above all as a support for the penal code is not merely or even mainly the result of the legislator's wish to restrain the wicked. The moral indignation of all the decent citizens cries out for gods who will avenge injustice. The legislator bows to this fact of political psychology. Earlier in the *Laws* we have learned that *thumos*, as the source of moral indignation, is practically the heart of good citizenship: "he who helps the magistrates as much as he can in punishing, he is the great man in the city, the perfect man; let this man be proclaimed as the bearer of victory in virtue . . . " (730d5–7). Now we learn that the Athenian places this desire to punish at the heart of zealous piety.[12]

But even this can be only part of the story, for the desire to punish is only part of what

[9] Consider here Plato *Apology of Socrates* as a whole and Leo Strauss, *What is Political Philosophy?* (Glencoe, Ill.: The Free Press, 1959), pp. 32–3. The note of Diès to this passage is charmingly naive: Platon, *Oeuvres complètes*, vol. XII, ed. and trans. A. Diès (Paris: Société d'edition "Les Belles Lettres," 1956), p. 144.

[10] Contrast 887b6 and c3, with 885e7, and see England's comment on the latter passage.

[11] *Thumos* and words of the same root occur five times in this speech (887c6, c7, 888a4, a5, a6), making it one of the more extensive references to *thumos* in Plato. Of the two most extensive references in the *Republic*, the first occurs just prior to the elaboration of the theology (*Republic* 375a–376c).

[12] Cf. William James, *The Varieties of Religious Experience* (New York: New American Library, [1903] 1964), p. 341: "Pragmatically, the most important attribute of God is his punitive justice."

Plato means by *thumos*. First we need to return to the surface to observe just what the Athenian does here. In a passionate speech he demonstrates by example the power of the reason for anger or *thumos* at the young unbelievers. What is implied in the denial of the gods, he shows, is the denial of one's own parents who nourished and educated one from birth — nay, not only of one's own parents but of all parents everywhere in the world. The Athenian, apparently blind to facts he showed us earlier, speaks without reference to the traditional Olympian gods; indeed he speaks as if the only gods worshipped anywhere in the world were the heavenly bodies. He goes so far as to say that "even a half-wit would agree there is not one sufficient reason" for denying the gods of one's fathers (887e8). Continuing in this abusive tone, he declares that the unbelievers are motivated only by "gluttonous desire for pleasure" (888a3).

The Athenian is not "letting himself go." He is rather revealing, for Klinias and all to see and ponder, the blinding force of the indignation that supports the submission to the gods of the fathers. By bringing *thumos* before us in all its living power he makes us perfectly aware of what we have to overcome. If we are to understand the connection between piety, *thumos*, and the family — if we are to comprehend fully in what sense *thumos* is the source of the gods — we need to reflect on this speech in the light of Plato's other presentations of *thumos*.

According to the *Republic*, *thumos* is one of the three parts of the soul, distinguished from reason and desire. It is understood primarily as anger but it represents, or is the source of, a range of phenomena including high spirit, competitiveness, love of honor, courage, and shame. The analysis of *thumos* in the *Republic* is somewhat obscured because of the parallelism Socrates insists on between the city and the soul. The high place of *thumos* in the city distorts the discussion of the place of *thumos* in the soul.[13] To arrive at an undistorted understanding we do well to follow Plato's hints and start from an analysis of a simple and common form of anger.[14] Anger follows upon frustrated desire. When we desire a good, move toward that good, and are then thwarted, an emotion appears which urges us to overcome the obstacle to the fulfillment of our desire. The same emotion is present when in moving away from an evil we are thwarted in flight. That emotion is *thumos*. It is first of all an impulse to overcome, or as Thomas Aquinas puts it, a response to arduous good, a response which serves desire.[15]

The second moment of this emotion is a sense of *self*. In moving toward a desired good our attention is focused on the object of desire: we tend to forget ourselves. But when we are thwarted, we are made painfully aware of the separation between the object and ourselves. We become conscious of ourselves as deprived and become directly concerned not only with achieving the object but also, and perhaps even more, with restoring ourselves to a good situation. This strong awareness of self develops further in the effort to overcome the evil or to have revenge. We can easily forget the original object of desire and become absorbed with a new goal, involving a sense of self which is not identical with simple self-love, for *thumos* and its sense of injustice may well lead us to risk our lives. *Thumos* gives birth to self-love in the sense of self-esteem, esteem for oneself as compared first with "the enemy", but soon with all other men and things.

A third moment of *thumos* is the mysterious tendency to assign complete responsibility to that which frustrates desire. *Thumos* even personifies lifeless objects — our impulse is to kick back at the chair on which we stubbed our toe; and in the *Laws* the penal code includes punishments for animals and stones (873e-874a; cf. *Exodus* 21:28–32). This assigning of responsibility gains added impetus from self-esteem, for injury that results from some intention endows us with more significance than injury that results from blind chance. These three fundamental moments persist in

[13] See the discussions by Leo Strauss, *The City and Man* (Chicago: Rand McNally, 1964), pp. 110–2, 129, 138; and Allan Bloom, *The Republic of Plato* (New York: Basic Books, 968), pp. 353–8, 375–8, 436.

[14] Cf. *Republic* 439d–440a, and especially 439e5. The strange example of Leontius should be considered together with the story of Cyrus in Xenophon's *Cyropaedeia* I iv 24, as well as other similar war stories. See also Aristotle *On the Soul* 432a24ff.

[15] Cf. *Summa Theologiae* Ia ques. 8 art. 2, ques. 81 art. 2, Ia IIae ques. 23 art. 2; *Commentary on Aristotle's On the Soul* 803–6. For a proper understanding of the teaching about *thumos* in the *Republic*, it is necessary to consider the order of topics which forms the context of the first emergence of *thumos* in the city: (1) the "city of sows," (2) frustrated desires, (3) war and *thumos*, (4) theology (*Republic* 369ff.). William James (pp. 210–11) devotes a paragraph to an unusually vivid and helpful sketch of what Plato would call *thumos;* his failure to link this insight with his general theme, however, is only one of many inadequacies in his discussion of the varieties of religious experience. Since James wrote, there does not seem to have been much progress in overcoming, let alone recognizing, the parochialism of his approach. See, e.g., Donald Capps, "Contemporary Psychology of Religion," *Social Research* 41 (Summer, 1974), 362–83; Geoffrey E. W. Scobie, *Psychology of Religion* (New York: John Wiley and Sons, 1975), chap. 4.

varying degrees in the more complex manifestations of *thumos,* in the courage that overcomes danger, in the proud firmness and sense of shame that overcomes base temptation, and in the sense of honor that leads a man to overcome all obstacles in order to be first.

If we focus on the second aspect, self-esteem, which shows itself most clearly in the sense of honor and love of glory, we see that this passion extends also to possessions, to the things that are one's own. This fact is strikingly manifest in the *thumotic* warrior class of the *Republic* who, like "philosophic dogs," love their fellow citizens and hate foreigners. In his discussion of them Aristotle is led to say that *thumos* is "the power by which we love *(philoumen)*" (*Politics* 1327b38–1328a17), meaning apparently that *thumos* is the source of the love of *one's own.* This manifestation of *thumos* becomes difficult to separate from desire. Provisionally we can say this: pure desire or love *(erōs)* seems to make us forget ourselves in the attraction to the thing loved; the more love is love of something as one's own, the more it seems to involve *thumos.* One sign is the fact that we are more apt to get angry at friends and brothers than at the beloved who has not yet accepted us. The part of our love which demands that those we love should reciprocate comes from *thumos (Politics* 1328a1ff.; *Laws* 717d). And this attachment to one's own calls for the belief that there are gods who watch over our city, our family, our property. In alliance with the gods one might overcome the hostility or indifference of the rest of the cosmos and implant on it one's indelible mark.[16] Such a belief implies that the actions of each individual are of importance to the gods. It leads to the notion that the gods as well as men are thumotic and are concerned with their own things; and that the gods' things include men and things that can be affected by men. It is the basis for the view that the gods call each man to account for what he has done and punish or reward him accordingly.

This self-esteeming part of *thumos* demands that each man be in control of his actions, and thus it goes hand in hand with the third part, the tendency to assign full responsibility. Even more important, the personifying tendency of *thumos* is one great source of man's capacity to imagine that the natural forces that act on him are the acts of responsible beings.[17]

The Athenian points to all these elements when he emphasizes that the atheists are men who turn against all parents, all family everywhere (see also the reference to the threat of incest at 886c and 890b). When he asks Klinias to subdue his *thumos* he is calling on him to subdue this irrational longing that his own people have cosmic significance. This begins his attempt to introduce Klinias and others to the possibility that the gods or highest things are untouched by the injustice of human beings and have disdain for the affairs of men.[18] In so doing, he prepares us for a civil theology which will to a considerable extent loosen the ties between the gods and the love of one's own. Another way of stating the Athenian's demand for the quenching of *thumos* is to say that he asks Klinias to be open to the possibility that the highest good for man, like that of the gods, cannot be taken away by others, or is not dependent on our having it as our private possession.

There is, finally, one other ingredient of *thumos* which leads to piety. The view of the world which *thumos* encourages is always in conflict with painful but obvious facts. It therefore has a tendency to become a tragic view of the world, as Homer's account of Achilles shows; the very regime of the *Laws,* according to the Athenian, is "the most beautiful tragedy" (817b). *Thumos* itself can sustain this view, however, in the form of hope. The passion which responds as anger or courage to immediate and near opposition also responds as hope to opposition seen in the distance.[19] *Thumos* as hope may even include hope for an afterlife or for divine intervention in this life. One of the meanings of the word *athumos* that the Athenian stranger uses is "faint-hearted." The Athenian asks Klinias to enter into the argument without *thumos,* and therefore without a heart full of hopes.

It is difficult to say how much Klinias understands of what the Athenian means here, not to speak of other parts of the *Laws.* It is doubtful, to say the least, whether Klinias as proud

[16] This is perhaps the place to note more precisely the context of the theology: it interrupts the discussion of penal laws intended to protect property (884a, 913aff.). The differences between the theology of the *Republic* and the theology of the *Laws* are due in part to the very different status of property in the two works.

[17] Consider, for example, Achilles' relation to the river in *Iliad* XXI 235ff. (cf. *Republic* 391b and Bloom, 356).

[18] Aristotle (*Rhetoric* 1408a16–17) indicates the commonsense source of the two possible postures toward the gods when he discusses the appropriate language to be used to describe evils. The appropriate language for *hubris* is anger, while for impiety (*asebeia*), disgust is fitting. The former implies injury, the latter contempt.

legislator for his new city could overcome his thumotic attachments without even knowing of other attachments to replace them.[20] It is even more doubtful whether the citizens who will listen to this prelude will overcome their *thumos*. At the end of this whole discussion, the Athenian makes it clear that his demand has not been satisfied, even by himself. The proof is not adequate, he says, because "it has been spoken rather eagerly somehow, out of a love of quarreling . . . on account of this an eager *thumos* (*prothumia*) has filled us so that we spoke rather vigorously" (907b10–c5; cf. 890e1). The whole proof must then be read with a view to the fact that the conditions the Athenian insisted on as essential to a "dialogue" have not been entirely fulfilled. Given the inextinguishable thumotic passions of good citizens, the Athenian cannot dispense with authentic religious passion in his exposition of civil religion. On the contrary, he must generate in himself a level of *thumos* which will in some degree match the temper of the city. This is indicated not only by the tone of the present speech but also by his use of oaths, a characteristic of angry talk (cf. 922d). The Athenian swears more often in Book Ten than in any other part of the *Laws*.[21] The theology of the *Laws* will occupy a middle ground between strict civil theology and a truly philosophic theology.

The thumotic attachment to self is an obstacle not only for the old men. Turning to a representative young atheist, the Athenian admonishes him to recall "first of all one great thing" — that his argument is not new. The love of truth alone, not the desire for one's own originality, qualifies a young man for "dialogue." After this the Athenian urges him to await the superior wisdom age will bring; he thus provides a soothing balm to any hurt the old men may have experienced in the admonition expressed to them (see Klinias' reaction at 888d6). Yet the authority of the old is tempered. The youth is not told to submit passively to lawful opinion but rather to "investigate" (*anaskopeō*—888c9). This is only the first sign of the common ground shared by the Athenian and the atheists.

888d7–890a9: The Pre-Socratic Science of "Nature." The most theoretical section of the *Laws* now begins as we learn that the serious atheists derive their conviction from a comprehensive account of all the things that "come into being," an account based on the distinction between nature, chance, and art.[22] The Athenian does not discuss how these terms or this distinction emerged, but according to the order of presentation it seems that the "wise men" began by recognizing a dichotomy between things made by art (human creation) and things not made by art, and drew attention to the priority in time, and therefore in rank, of the things not made by art. Every transformation made by art in a material is limited by the pre-existing characteristics of the particular material and of the artists. Therefore the things not made by art "are" more truly, are "the greatest and noblest things," while the things made by art are "lesser things" (889a4-8). The things not made by art are "by nature." But "nature" must be further analyzed. The things which set the bounds for art are themselves "produced" from more fundamental things. Fire, water, earth, and air are the most fundamental things, the only things which are not said to "come into being" but only to "be" (889b1-2; cf. a7).[23]

Fundamental here means prior in causal power or responsibility. In the initial presentation, which we are inclined to call the most profound, the atheists are not said to call the

[20] Thomas brings out with impressive clarity the intimate psychological connection between anger (the "irascible faculty") and hope: *Summa Theologiae* Ia ques. 82 art. 5, Ia IIae ques. 23 art. 2, 3, 4, ques. 25 art. 3; *Commentary on Aristotle's On the Soul* 806.

[21] Cf. 890e1 where the Athenian again characterizes Klinias as "most eager-spirited." Certainly Klinias will have to ponder this as well as other parts of Book Ten, using the notes he says he took during the conversation (*Epinomis* 980d).

[22] The oaths in Book Ten are at 891c, 895d, 905d. The Athenian swears only six other times in the rest of the *Laws* (662c, 683e, 691b, 720c, 721a, 858c). Consider here also the Athenian's momentary sense of near shame (886a7). In contrast to the Athenian, Klinias never swears in Book Ten (he has five oaths in the rest of the *Laws* — 660b, 715d, 814b, 821c, 965e). This is a sign that Klinias is less passionate than usual, or that his *thumos*, while it has not disappeared, is more quenched than at other times.

[23] Note that the passage we are about to investigate represents the only contemporary account of pre-Socratic philosophy which has come down to us in unfragmentary form. For the best discussion of the moral and political import of pre-Socratic philosophy, see Leo Strauss, *Natural Right and History* (Chicago: University of Chicago Press, 1953), chap. 3. See also Strauss, *The City and Man*, pp. 14–17.

[24] Something close to the four elements to which the atheists ascribe all the beings seem to be treated by the Athenian in the context of farming (water, earth, the sun, and wind — 845d); with regard to an interest in farming there may be more agreement between the Athenian stranger and the pre-Socratics than meets the eye. See 889d6 and Leo Strauss, *Xenophon's Socratic Discourse* (Ithaca, N.Y.: Cornell University Press, 1970), pp. 195–6.

four elements the "first things"; they use the word "first" only when they speak of the relation of the products of nature to the products of art (889a7). Does this mean that the atheists do not necessarily assign temporal priority to the four elements? Do they perhaps hold, for example, that heavenly bodies of some sort have existed always, forever coming into being and passing away, without there ever having been a time when the four elements existed "pure" and unmixed (cf. Aristotle *On the Soul* 405a28ff.)? If this were so, then "nature" in the most fundamental sense would mean not the four elements, but "the eternal productive and destructive action of the four elements" (or, perhaps more cautiously, "the coming-into-being and passing-away connected with the four elements").

Here the Athenian does not give this or any other definition of nature. Instead, after pointing to this possibility, he veils it by supplying several pages later (891b8–c5) a definition which is so clear that we are tempted to read it back into the original presentation. The visible hesitation with which he presents the definition does not by any means take away the temptation. His words are: "The one who is saying these things comes close to holding that fire, water, earth, and air are the first things, and comes close to naming these things nature" (891c1–3). This definition promotes an impression that the atheists assign strict temporal priority to the elements and can conceive of them as existing unmixed — although the sense of priority intended by the word "first" is ambiguous. Still later, in a final presentation of the atheists' definition of nature, the Athenian steps back a bit toward the definition implicit in his first and fullest presentation of the atheists' views: "nature, they mean to say, is the coming-into-being connected with the first things" (892c2–3). Neither of his stated definitions is downright misleading, but the Athenian seems strangely reluctant to bring out the possible eternity of the generative action or motion of the elements, and strangely eager to equate causal priority with priority in time. The reason will begin to appear shortly.

The four elements which are preeminently nature exist as bodies in motion; they are without soul; this means, to say the least, that they lack all of the properties we see to be specifically human — they are indifferent to "humanity." They move, meet, and sometimes form composites, new bodies. When the atheists speak of the elements existing "by nature *and by chance*" they seem to refer to the way in which the elements, nature, works or moves: the motions of the four elements and hence the composites which result from this motion, are purely random. The randomness, the atheists say, exists "from necessity" (*kata tuchēn ex anangkēs*—889c1). By this they mean that the randomness arises out of the unchangeable properties of the motions of the four elements. Each of the elements will have certain constant properties, such as speed and mass; and the motion of fire cannot suddenly become the motion of water or exhaust itself altogether. But although the motions and composites are thus determined, they are no less random, for none of the particular composites are any more or less necessary than the infinite other composites which may come into being and pass away. Since according to the atheists all things are such composite bodies, no new thing is needed to explain the emergence of life (889c4).

Each kind of composite, although it comes into being by chance and is not external, has its own particular characteristics. With a view to the mode of expression used a little later, we can call these characteristics its particular "nature" (889d5ff.). Nature in the most fundamental sense, i.e., the activity of the elements, is indifferent to the existence or disappearance, prosperity or failure of any sort of composite being. But the particular nature of each composite can provide a standard for the natural good and bad for it. Seen from the perspective of the elements, all situations of composite beings are equally natural and equally by chance. But seen from the perspective of a composite being, some situations are in accord with its natural function and are therefore natural, while other situations are not in accord with its natural function and therefore happen to it by chance.

Man is one of these later, composite beings. But he differs from all other beings in that he is characterized by the power to mold himself and his environment through *art* (889c6–d1)—hence the amazing variety in the ways of man, in contrast to the unvarying ways of other things; hence the ability to make things *seem* different to man than they truly are by nature (889d1–3). The outstanding example is man's creation through art of a way of life in some city which then coercively claims that this way of life is the only way good for human nature. Art's power of deception or self-deception is at the root of the atheists' depreciation of art as opposed to nature. The arts can be divided into arts more and less natural. As unnatural arts the Athenian has the atheists point especially to painting and music (889d3). These arts, they say, change the appearance of things so as to

make men believe things are other than they truly are. They can give man needs, fears, and concerns which he does not truly have, which are in no way required for his successful functioning. They achieve this in great part by creating images of men, of things, or even of wholly imaginary beings which can never be yet which we fear or long to imitate. Since the products of these arts do not refer to or imitate anything that exists, they are arbitrary; what they turn out to be is, from the viewpoint of human nature, a matter of chance. There can also be "serious" or natural arts, however, arts which follow and work according to the natural working of things, composite bodies. Medicine, for example, corrects the human body with a view to its true needs and nature (889d6).

But according to the atheists, the art of politics and even more the art of legislation are not natural arts. We discover here that the denial of the gods is only the most immediately shocking part of a much broader attack on the validity of all law and the naturalness of all political life and aspiration. As the Athenian presents it, the dispute about the gods leads directly and necessarily to the dispute about the existence of "natural right" (*ta dikaia phusei*— 889e7). In order to understand why and to what extent this is so, why the natural basis for justice stands or falls with a natural basis for civic gods, and vice versa, we need to remind ourselves of the Athenian's earlier analysis of law and "the regime" (*politeia:* 625a6–7, 689e–701b, 712b–715c, 886b11).[24] According to his argument law is not the fundamental political phenomenon. Law is given its order and direction by the decision as to the human type which will constitute the ruling group in the city. This decision sets up and defines the "regime." The way of life of the authoritative group determines the way of life, the specific virtues and excellences, to which the whole city looks up and is dedicated. In every regime the beliefs about the gods or the most revered things, however much they may be adopted from tradition, are transformed to become the crowning expression of the morality that is the regime (890b6–c2): the gods are "such as the laws say they are" (885b4, 890a6,b7, 904a9). As we shall see, the Athenian himself would seem to hold that the opinions about the gods in some cities may be perceptions of the truth about the nature of man and the cosmos; the more just or in accordance with nature the regime, the more truth in its opinions, up to a certain point. What makes the atheists' critique so thoroughgoing and profound is that they deny all truth to every regime's opinion about justice and the proper way of life. As we often hear said today, these opinions are mere "ideologies"; the cities have no idea of the way things really are.

In each city, say the atheists, there is a never-ending dispute about what is just. Each city is continually changing its laws, even its most fundamental laws and its regime. Each of the opinions about justice which it legislates is given with the same authority (889e7–8). This clear sign of the arbitrary character of the laws and the just things points to the truth about them. Each decision about what is just or noble can be traced to essentially chance circumstances which precluded the consideration of other notions of what is just, and the circumstances which made one individual or group the strongest and hence able to impose its interest and opinion.

But such a description of the establishment of law in most cases would not be a sufficient proof of the *impossibility* of nonarbitrary, reasoned legislation based on what is good by nature for all the men in a city. The core of the atheists' rejection of natural justice must depend on an analysis of the natural good for man. The following analysis is barely visible in the Athenian's presentation here. "Justice" is equivalent to "the common good." The notion that there is a true or natural basis for justice depends then on the assertion that what is truly good for man can be common, common to a whole city. The atheists deny that the naturally good for man can be common. This follows from the assertion that man, like all other things, is soulless composite body in motion. Each man is nothing but body; the good for man is the good for his body, and as the Athenian some time earlier has conceded, the body with its pleasures and pains cannot be shared, at least not by any group as large as a city (739c–d).[25] Goods which please the body can be "shared" in the sense that they must finally be divided up and consumed or enjoyed by each; but they cannot be shared together, in the sense that their enjoyment, like that of seeing the sunset, for instance, does not require being divided up and parceled out, and hence does not induce competition.

[24] Klinias seems at first puzzled by the connection between the dispute about the gods and the denial of a natural basis for law and politics: see his reaction at 889e2 and the Athenian's response, "O blessed" (i.e., for your ignorance — cf. 831c1 and 886a6).

[25] This shows why the theoretical position of the atheists can with some justice be equated with the view that the good is bodily pleasure: 886a9, 888a3, 908c2.

According to this analysis of the human good we see that in each of the cities most men obey the law because they are deceived into thinking it represents some common good greater than many tempting private goods. In fact, the regime and its laws almost always exist for the sake of some private good — of some class alliance or of some individuals. Those who are privately benefited may or may not be aware of the deceptiveness of the claim of the regime to exist for the sake of the common good.[26]

Having proceeded thus far in the elaboration of his opponents' views, the Athenian creates a slight break in his account by pausing to address his two interlocutors as "my friends" (890a2–3).[27] He thus reminds them of the political projects which is the only known basis of his friendship with them, and calls them to attention, preparing them a bit for the immediate sequel. Prior to the slight interruption they had just heard an account of the nature of things, an account almost entirely hostile to all political life. Now they will hear a political teaching with recommendations or imperatives drawn from the teaching about nature. Those who draw these political conclusions are "men (*andres*) considered wise by young people (*anthrōpoi*—cf. 891c8)." It is not immediately clear whether these men are those who developed the natural philosophy or whether they are men who repeat what others have developed and add a political teaching; but they are said to include poets[28] as well as "prose writers" (890a4). Is the political teaching which follows not a "corruption," or at any rate a problematic derivation from what the thinkers about nature hold? True, the natural philosophers, while denying all natural status to the art of legislation, conceded "some small bit" to the art of politics (889d): politics is by nature good to the extent that a man promotes his security by engaging in political life and taking advantage of the deceived multitude who do not recognize the falseness of the common good. But the "poets and prose writers considered wise by the young" go further. They say there is a kind of justice according to nature. The "most just thing is victory by force"; "the right life according to nature is ruling over the rest and not being a slave to others according to the law" (890a4–5, 8–9. We note that this "art" of the natural rule of the stronger over the weaker imitates or accords with the natural predominance in the cosmos of the stronger bodily motion over the weaker. It is clear that the ultimate aim of such political activity would be the overthrow of the existing regime in order to rule as tyrants in the open (890a7).

In his explanation of their views the Athenian has blurred with remarkable ease several different kinds of atheists and atheistic opinions. He has in this way indicated for us the variety of his opponents even as he compelled us to focus on the politically most relevant or active type. The atheists last described certainly do not believe that the philosophic or even the simply private life is superior to political life; philosophy and the philosophic life are never mentioned in Book Ten. It is even more curious that in describing their opinions the Athenian never mentions "the good" or "good things," although he mentions "noble things" and even "noble things by nature" (889e6). He also never mentions pleasure here (contrast 886a9, 888a3, 908c2). We are compelled to ask whether the atheists see the nobility of rule merely as a means to private (bodily) pleasure and private good or whether they are attracted by the noble splendor of rule and public honor for their own sakes. To the extent to which the latter is true, their good would seem to become dependent on bowing to the notions of "service to the city" and "the common good," notions which they claim are wholly false. This is the general direction that Socrates takes in refuting Callicles and Thrasymachus. But in this discussion the Athenian only hints at such a problem because he is interested more in confronting the sophists' opinion about the gods and the account of nature which underlies and supports them.

890b1–893a9: The Socratic Science of "Soul." The description of the atheists' arguments leaves Klinias a bit stunned. Whereas before he predicted that the argument would be "difficult" (886e2), he now says this argument is the "ruin of young people in their public affairs and in

[26] It is possible that with a view to war, the citizens as a whole form an alliance of selfish interests set over against the rest of men. This was the interpretation of Sparta and Crete held originally by Klinias (625e–626a). But as the Athenian showed, this understanding does not give adequate support to the city's claim about the common good. Such an alliance only holds as long as it is not to the advantage of groups or individuals to desert; the alliance does not support the city's claim to have the right to sacrifice the goods and lives of citizens. And it quite fails to provide a basis for the sense of sanctity of the city: nothing makes this group, "our" group, intrinsically better than any other group (626–30).

[27] I owe this observation and part of what follows to David Bolotin.

[28] Especially the poet Pindar, who seems to have taught the Athenian that by nature strength gives a right to rule (690b–c, 714b–715a). Cf. England on 890a5.

their families" (890b1–2). The Athenian does not try to reassure Klinias; instead, he tells him that he speaks the truth and then asks for the second time whether they should give up. Before he had asked, "What should *we* say, what should *we* do," Now, just after addressing Klinias alone by name for the first time in Book Ten, he aks, "What do you think the legislator should do?" (886e6, 890b3–4); Klinias is handed the responsibility of dealing with the atheists. The use of the word "do" but not "say" characterizes the remark as a whole — the Athenian devotes much more of it to asking whether they should stop talking and institute penalties than to asking whether they should continue to try to persuade the atheists. By this he leads Klinias to urge even more strongly that they continue; having seen the full gravity and complexity of the sophisticated arguments, Klinias realizes that punishment alone cannot ward off so strong an attack; he cannot let the Athenian give up while a hope of refuting the opponents remains. But in contrast to what he said when he first suggested giving up, this time the Athenian no longer holds out the hope that it will be possible to refute the atheists: they "have been prepared from old" (887a5–6, 890b4).

Klinias's reply shows that the Athenian has successfully moderated without dashing his hopes for refutation, and has drawn his attention to his extreme need for help. Klinias has not, however, lost his alertness; he sees that "nature or something not less than nature" must be the standard, and he understands that the Athenian's argument will turn on the relationship of law and art to mind (*nous*—890d6–7; cf. 886a2–4, 889c5). But the Athenian is not yet satisfied with the still "most eager-spirited Klinias" (890e1). He raises a new difficulty, the problem of giving as refutation complex arguments in a legal prelude that is addressed to the multitude, and reminds him "again," but in stronger terms, of the "enormous" length the argument requires (890e1–3).

Since Klinias had already answered once before the objection about length and considers it the lesser problem, he answers it first with a mildly admonitory question that reminds us all of the spirit in which the whole dialogue began. The discussion of drunkenness with which the Athenian opened the conversation served to loosen the tongues of the old Spartan and Cretan by reminding them of forbidden pleasures and perhaps of youthful transgressions; it made all three "vicariously drunk."[29] The Athenian here has made it necessary for Klinias to recall to them the beginning and hence to reinvigorate the freedom of speech and thought, the youthfulness, that the beginning produced.

Klinias then deals with the new objection, the difficulty of speaking before a multitude. He readily concedes that the multitude of citizens will include many who are not intelligent enough to understand the argument about the gods, but he argues that the prelude, as something written, exists for the slow learner to study over and over. Klinias agrees that the public pronouncement of the most important prelude — the best prelude for all the laws — will be unintelligible to many of the citizens. He thus frees the Athenian from a limitation that has characterized all the other preludes (cf. 718bff., 857bff.). The Athenian has correctly counted on Klinias's gentlemanly contempt for the multitude to make it possible for the city's opinions about the highest things to be above the level of understanding of most. The inegalitarian nature of Klinias's concession is one of the most obvious reasons why such a defense of the gods as the Athenian gives could not be given in a democratic regime.

At this point, just after Klinias has said that the written prelude will be available for the slow learner to study, Plato has Megillus speak a few approving words, his only words in Book Ten (891a8, b7). The *Laws* is not as lacking in wit as many scholars maintain.[30]

Having left behind the multitude and even Megillus, the Athenian feels called upon to invoke more strongly than ever before the "partnership" between him and Klinias. He proceeds to restate the atheists' position with the clear definition of nature that we have discussed,

---

[29] See Strauss, *What Is Political Philosophy?*, pp. 31-2. Cf. Eric Voegelin, *Order and History*, 6 vols. (Baton Rouge: Louisiana State University Press, 1956) III, 240–1.

[30] A full understanding of Book Ten would require further consideration of Megillus's role. Throughout the *Laws* his importance is out of all proportion to the number and length of his "laconic" utterances; but in Book Ten he takes on a special importance. This is shown by the mild apology the Athenian makes to him here (891b2–6) as well as by the fact that the Athenian addresses him relatively frequently in Book Ten (he addresses "Megillus and Klinias" at 888d and 899c; Megillus alone here at 891b; and "Klinias and Megillus" at 900c. I believe he addresses the two together about thirteen times in the rest of the *Laws* and Megillus alone about six other times). Megillus rather than Klinias has shown the capacity to keep the Athenian from straying away from human affairs toward the truly divine things (803b–804b); he is closer to the human type which will constitute the ruling majority, the "regime" of the new city. By making the discussion of the gods acceptable if not comprehensible to Megillus, the Athenian assures that the theology is acceptable to the multitude of the citizens.

and adds that according to this understanding "soul" is derived later from the four elements (cf. 889b5). He then says, swearing by Zeus, that they have found the source of error of all those who have ever investigated about nature (891c7). The Athenian's refutation of the atheists begins with an assertion supported (at first) with nothing but a passionate oath; he secures a sense of certainty in the hearer before presenting any arguments. But oaths are not needed to support assertions whose justifications are clear and as Klinias's response shows, the meaning of this assertion is not at all clear: above all, we have not been told what is meant by "soul." The Athenian says he cannot explain without using "rather unfamiliar arguments." Klinias fully senses his need for help; he has in addition the Athenian's assurance that the source of the error of the atheists has been discovered; he cannot possibly let the refutation stop now. With understandable reluctance, and addressing the Athenian as "you amazing man," Klinias agrees that the Athenian can go outside the sphere of legislation to use "unfamiliar arguments" (891e1–3) — unfamiliar, we may add, not only to the multitude but to the legislator himself. It turns out that the same criterion which first persuaded Klinias to rank himself above the multitude of citizens now makes him rank himself closer to the multitude than to the Athenian. The distinction between the philosopher and all the nonphilosophers proves to be more important than the distinction between the statesman-founder and his people. Will there be anyone in this city (except perhaps some of the redeemed young) who knows who the gods of the city are?

Adopting "unfamiliar" or philosophic language, the Athenian begins his explanation by saying that the atheists have not properly understood what is "the first cause of the coming-into-being and passing-away of all things" (891e5–6). He does not, however, proceed to say what is the first cause; instead he indicates that his predecessors have failed to understand nature because they have failed to understand the soul, "what it happens to be, what power it has, and above all how it comes into being." "Soul," he says, "comes into being among the first things, prior to all bodies, and is, more than anything else, the cause of changes in bodies and of all reordering of bodies" (892a2–7). He thus leaves us in the dark about what might be the other "first things" which may not come into being, and which may cause the coming-into-being of bodies (and perhaps even of souls).[31] A greater cause of dissatisfaction is the Athenian's continuing failure to define "soul." We suspect that he means something more or less like the human soul (cf. 891e7, 886b1), and when, a few lines later, we hear that opinion, supervision, mind, art, and law are "things akin to soul," our suspicion seems confirmed. But if these five things are only "akin," then none of them *is* soul. Could soul be understood here as principally the passions (*erōs* and *thumos*)?[32] Could a misunderstanding of the passions — more than a misunderstanding of mind *(nous)*, art, or law — be the source of the pre-Socratic misapprehension of nature (cf. 967a–c)? At any rate, if soul is prior to body then the things akin to soul are prior to the things belonging to body. Passing over the obscurity about the first things besides soul and especially about whatever might be the cause of the coming-into-being of soul, the Athenian asserts that the deeds of art and mind must be "the great and fair deeds" and that "it must be most correct almost (*schēdon orthotata*) to say that soul is preeminently by nature."

But what does all this have to do with the gods? The nerve of the Athenian's argument seems to be this: something like what we call "the soul" in man, with its power to use art and mind, is prior in time and hence in dignity and causal power to all the bodily phenomena the atheists called nature. Therefore the city which reveres something resembling the human soul as the oldest and most powerful thing is much closer to the truth than are the atheists. The city is also nearer the truth when it honors arts and laws which promote the good of the soul above arts which serve the good of the body. A great deal turns, then, on whether "someone can show that soul is older than body" (892c6).

But even this achievement would not entirely vindicate the city. In the first place, if the city is truly to revere the soul it must know what the soul is; secondly, if the city's claim to be devoted to and to promote a common good is to be justified on the basis of the soul, the good for the soul must be shown to coincide with the common good. It follows, by the way,

[31] Certainly, according to the Athenian, soul is not the only thing that causes changes in bodies: after all, do not bodies cause changes in bodies?

[32] Compare R. Hackforth, *Plato's Phaedrus* (Cambridge: Cambridge University Press, 1972), p. 76: "It is significant that the two dialogues in which the moving function of soul is prominent — *Phaedrus* and *Laws* — are the only two in which the passions (emotions) and desires are clearly attributed to discarnate soul."

that once we establish what soul is and what is good for it, we have a natural standard for judging which arts, laws, and opinions are better and which worse. It must be admitted that at this point the Athenian hardly draws attention to these latter issues. He focuses on the issue of the soul's priority in time. Indeed, he seems to assume that *all* art, law, and opinion, as well as mind and supervision, is equally "akin to soul."

If we refer to the distinction originated by the atheists, we may say that whereas they made chance the principal part of nature and denigrated art, the Athenian makes art the principal part of nature and is altogether silent about chance. To leave it at this, however, would not do justice to the remarkable degree of agreement between the Athenian and his opponents. For the Athenian, as for the atheists and for the Platonic Socrates, the key question is "what is nature," nature understood as the first or fundamental cause. Contrary to the Platonic Socrates, and in agreement with a certain (exaggerated? — see above) version of the atheistic view, the Athenian holds that the first causes are the first things *in time*: priority in rank is the same as priority in time. To bring out more clearly the implication of the agreement between the Athenian, the atheists, and the city, in opposition to Socrates, we may say that the thesis is "the oldest (*presbutaton*) is the best."[33] Closely related to this is the un-Socratic forgetting of the ageless things which do not come into being or pass away. We are told by the Athenian that soul and the things akin to soul (including mind) all "come into being" (892a4–5, 8), and he accepts the notion that "nature is the coming-into-being connected with the first things" (892c2–3). Book Ten as a whole is silent about the *ideas*.[34]

[33] For the replacement of the term "first things" (*prōta*) by the terms "older things" or "oldest things" (*presbutera* or *presbutata*) see 892b1, c6, 895b5, 896b3, c6–7, and above all *Epinomis* 980d.

[34] To put it another way, the question "What is soul?" is never really asked, and is replaced by the question "How does soul come into being?" The Athenian cannot, however, completely avoid the word *eidos*: 894a8, 895c5. Victor Brochard decisively refuted Lutoslawski's claim that the *ideas* are omitted in Book Ten because they are missing from the *Laws* as a whole (hence indicating a radical change in Plato's thought). But Brochard failed to explain sufficiently why the *ideas*, mentioned or discussed elsewhere (especially 965b, 967d), are never referred to in Book Ten. See Brochard, "Les *Lois* de Platon et la théorie des idées," in *Etudes de philosophie ancienne et de philosophie moderne* (Paris; J. Vrin, [1912] 1954), pp. 151–68, and especially pp. 163–4.

Before finally beginning his refutation of the atheists, the Athenian raises one last difficulty (892c9–893a7). Klinias has had a taste of the "unfamiliar" arguments, but the Athenian now makes it clear that he can have no active part in the "dialogue" about the gods. He and his Spartan friend can only listen in silence as the nameless Athenian proceeds alone, both speaking on behalf of a nameless atheist and responding to that atheist's questions, until the "whole" argument about the priority of soul is completed. For engaging in this argument is like fording a swift-flowing river — dangerous for old men lacking in strength. The simile of the river softens the Athenian's attack on the old by focusing on the age of their bodies, a proper excuse not to ford such a river. After all, it is not the superiority of old body but of old soul that is essential to the city. But what the old men actually are warned not to wade into is no river but an argument which only the Athenian can put forward (cf. England ad loc.) and which only the Athenian can master, through the strength of his youthful soul: the argument that soul is oldest and therefore best can be defended only by the youngest soul — the Athenian soul open and eager for new and strange things (contrast 888c1ff.).

The Athenian's remark here is the culmination of the drama which has prepared the way for a theoretical defense, based on nature, of the city's gods. The preparation of the legislator has been at the same time a demonstration to us why such a defense is necessary, a demonstration of what the function of civil theology is. We now understand that that purpose goes beyond answering the political and psychological (thumotic) needs of the citizenry. In the case of attentive citizens, the preparatory section begins to make them self-conscious about those needs; in the case of the "young in soul," regardless of the age of their bodies, the preparation and the theology awaken and begin to answer their doubts about the truth of the authoritative political opinions. For some, this beginning will be enough. For others it will not. At the end of Book Ten a new institution, the "nocturnal council," is introduced. This semi-secret body, whose power and complexity grows as the *Laws* draws to an end, will meet every night with those who have been convicted of impiety without beastiality, and will continually study and reconsider (cf. 899c6–7) the arguments in Book Ten and others no less wonderful. The place where the nocturnal council meets in private, and where the impious are sent, is named the *sophronisterion* ("the moder-

ation-tank"—908a4, 909a1). This name is a comic word coined by Plato in answer to a comic word coined by Aristophanes. In the *Clouds*, Socrates and his followers meet in the *phrontisterion* ("the think-tank").[35] Book Ten shows how philosophy can find a home in a city ruled by nonphilosophers. Combining moderation (*sophrosunē*) with thought (*phronēsis*), philosophy uses theological rhetoric to make a home for itself by first exposing the nakedness of the city and then inducing the rulers to request that the philosopher come to cover that nakedness. Through theology, philosophy makes atheism — the denial of natural right, the denial of the city — a living challenge within the city. Philosophy comes to sight as being for the sake of theology which is in turn for the sake of the city; we are eventually led to wonder whether it is not equally the case that the city is for the sake of the theology which is for the sake of philosophy.

But these various functions of the theology do not completely harmonize with one another. The unphilosophic needs of most citizens which the theology must satisfy are, as we have seen, obstacles to philosophy—unmovable obstacles to any fully theoretical discussion of the gods. The public theology can therefore be no more than an attenuated account which satisfies the needs of the city while at the same time it invites and stimulates a train of thought that goes beyond the surface doctrine. In the Athenian's preliminary sketch of the argument about soul we have already begun to see how he creates a doctrine whose lacunae and paradoxes point the attentive listener in the direction of a different account. For the present we can only draw attention to a few of the outstanding features which help show the path from the paradoxical surface of the theology to its unambiguous core.

Refutation of the Atheists

893b1–894a9: A Sketch of Platonic Physics. Plato seems now to have set the stage for a unique and most remarkable conversation. We anticipate hearing a philosopher's dialogue with himself, his self-questioning as he conjures up in thought an intellectual equal who would disagree on *the* fundamental issues. Our hopes are only slightly dampened when we hear the Athenian begin by invoking the aid of "god" as well as of "those whose existence is to be proved"; by now we have come to expect that the proof of the existence of the gods is predestined by the political exigencies of the situation. We are predestined, however, to a more severe disappointment. Whether we can overcome our frustration, whether the aborted dialogue irritates us or whets our desire, is part of the test the Athenian, and Plato, create for us.

In answer to the atheist's first question, do all things stand still, or is the opposite true (all move),[36] or do some move and some remain at rest, the Athenian gives the common-sense answer that some move and some remain at rest.[37] In accordance with the previously noted abstraction from the unchanging *ideas*, the Athenian has the atheist refrain from any attempt at refuting or even inquiring into the thesis that some things do not move or change. The atheist instead turns to a discussion of motion and asks two more questions which seem designed to begin a classification of motion in terms of its spatial character, i.e., as locomotion, change in or of place. At the third question, which distinguishes rotational from linear locomotion, the Athenian, rather than answering, reveals dissatisfaction with the imprecision of the atheist and asks the first of his own questions. Following this point the Athenian creates a certain ambiguity about who is supposed to be speaking which lines, but I am strongly inclined to believe that we should assign all the longer utterances to the Athenian, who has taken over the initiative. Reading thus, we find the atheist answering the Athenian's first question with a simple "yes," and the Athenian then proceeding to dwell on the qualitatively different character of rotational locomotion. There was no hint of such a qualitative difference in the atheist's question. As for the reason why the Athenian finds circular rotation a "source of wonders," it seems to depend on the geometrical relationships which he knows would obtain in the spinning of a perfect circle or sphere and which allow it to move at different speeds in the same place at the same time (893d1–5). At the end of the Athenian's further classification of locomotion, including combination (increase of mass) and dissolution, the atheist expresses full agreement.

This is the last we will ever hear from the atheist, for when the Athenian proceeds to talk about the motion which is "growth" and insists that this cannot be understood as mere increase

[35] *Clouds* 94. See also the quotations from comic poetry in the explicit discussion of philosophy in Book Twelve: 967c5–d1.

[36] The Greek word for motion, *kinēsis*, also means change, and this should be borne in mind throughout.

[37] In this he joins the Platonic and Xenophontic Socrates against the pre-Socratics: see Xenophon *Memorabilia* I i 14 and Plato *Theaetetus* 180d (where Socrates says his is the view of the cobblers).

and decrease resulting from complex locomotion of matter, the atheist is never allowed to reply. We are left even more curious when we are kept from hearing what the atheist would say to the Athenian's question and answer regarding coming-into-being. The Athenian's own account (894a3–5) is based on a striking but obscure geometric analogy that characterizes coming-into-being as the emergence of perceptible or three-dimensional objects from the successive dimensional "growths" of a non-dimensional point or source (*archē*).[38] What the Athenian gives us, it turns out, is not a real refutation of the atheists but rather an unusually abstract, compressed statement which only hints at key points of criticism.

Considering this exchange in the light of the fuller presentation of the atheists' views a few pages earlier, we draw the following conclusions. Not only does the Athenian differ from the atheists in that he takes account of things which do not change, but furthermore he denies that change can all be understood as the result of locomotion, however complex. One cannot understand the "growth" of a thing (say, a puppy) without seeing the increase and decrease of matter as regulated by the "lasting character" (*hexis diamenousa*: e.g., the "dogness") of the thing; when the character disappears or is replaced, then (as in cancer) increase as well as decrease simply destroys the thing. Growth is the interaction of the changing and the unchanging (893e6–894a1; cf. 894a7).[39] Moreover, even in the case of simple locomotion in dead matter, the Athenian (unlike his "materialist" opponents) cannot study "physics" apart from the nonmaterial entities of geometry and number: to understand the rotation of a star, for example, one must consider the geometric properties of a circle never present in any matter (893c7–d5). Finally, the way we follow by our minds alone the timeless geometrical construction or "generation" of the spatial properties of visible objects from unseen first principles (the point, the moving point which is the line, the moving line which is the plane, etc.) is one key to the way the visible beings (dogs, men, stars) "come into being" in matter, from invisible but intelligible principles (894a1–8).

894a9–899b9: The "Ideas" and the Soul. At the end of his mysterious remarks about coming-into-being, the Athenian abruptly turns to Megillus and Klinias, addressing them, "Oh friends" (894b1).[40] In a remarkably brief time the Athenian first has slid into the questioner's role originally assigned to the atheist and then has maneuvered Klinias into his own former role as respondent. The Athenian can introduce into the legal prelude no more than a glimpse of truly philosophic debate — a glimpse that points to "another and longer road" beginning from something other than the primacy of soul understood as self-moved motion. Until the atheist receded from view, the Athenian could not bring himself even to mention soul; although he discussed the cause of coming-into-being, he never referred to the temporal priority or to the self-moving capacity of that cause. To come to grips with the proof of the existence of gods that now unfolds, we need first to lay out the stages of the argument; after that we can try to assess the relative validity of the parts in order to understand what the Athenian's real views are and what are the reasons for his deviations from those views.

At the outset he gets Klinias to agree that all motion, however else it may be classified, can be divided into two kinds: motion which not only moves other motions but also moves itself; and motion which can move other motions but not itself and hence is always moved by another, preceding, motion. Nothing is ever said about the possibility of a thing which could cause other things to move but would itself remain unmoved. That the self-moved motion exists, that it is the most active, the first both in power and time, and the cause of all other motion, is proved on the basis of a premise stemming not from the Athenian but from what "most" of the atheists "dare to say," namely, that "all the things that come into being once somehow stood still together" (895a6–b1). At this point we still wonder what precisely all this has to do with "soul."

In the second stage (cf. 895c1) it is established, with more participation from Klinias, that our only direct experience of self-moved motion is the motion we call "living." Further-

[38] Some light is thrown on this very dark sentence by the commentaries gathered together and summarized in England, ad loc. See also Aristotle's partial elucidation in *On the Soul* 404b18ff. as well as Joseph Moreau, *L'Ame du monde de Platon aux Stoiciens* (Paris: Société d'edition "Les Belles Lettres," 1939), p. 61; J. B. Skemp, *The Theory of Motion in Plato's Later Dialogues* (Cambridge: Cambridge University Press, 1942), p. 104; Paul Kucharski, *Étude sur la doctrine Pythagoricienne de la tetrade* (Paris: Société d'edition "Les belles lettres," 1952), pp. 71–4.

[39] Cf. *Theaetetus* 181cff., *Parmenides* 138c, and Aristotle *Physics* VII ii.

[40] Could the accounts before and after the Athenian's invocation of his "friends" bear the same relation to one another as the accounts before and after his identical interruption of his presentation of the atheists' views (cf. p. 1068 above)?

more, whenever we apply the term "soul" to anything, we mean something is "alive."[41] After digressing to give, in the name of Zeus, a lesson about the nature of names and definitions, the Athenian claims that soul must be defined as the motion that moves itself. Hence soul is the oldest cause of all motion, if not the oldest thing simply, and rules by nature over all body. Is soul then god? Is soul "Zeus"?

The third stage shows that since soul, as the cause of all moving things, must be the cause of the evil, base, and unjust as well as of the good, noble, and just, there must be two souls or two sorts of soul. Somewhat to our surprise we learn now that priority in age, in power, and in rank over body does not necessarily imply goodness. Soul becomes good only when it "takes as its helper mind (*nous*), god in the true sense of the word for the gods."[42] But then which sort of soul predominates in the cosmos — the good, divine sort or the opposite? (Two things are certain; soul by itself is not divine, and the divine is not omnipotent.)

The last stage (or two stages: 897b7, 898c9) establishes the predominance of the divine kind of soul. The heavenly bodies, which manifestly dominate the whole universe, have a motion (orderly, circular revolution) which indicates that they are moved by soul possessing *nous* — for circular motion is an "image" of the motion of *nous* — and can therefore be worshipped as gods. This culmination of the argument is explicitly unscientific: the original theology of the "amazing" Klinias (897c4) is here vindicated through the Athenian's poetic use of "imagination" and "fine craftsmanship in speech" (898b2–3).

What strikes us as most plausible in all this is the assertion that the motion of living beings possesses, to greater and lesser degrees, an indeterminacy and independence that is missing from the motion of dead matter, and that living motion is capable of setting dead matter into motion. This phenomenon of living motion is surely a key part of what we intend by "soul." In addition, it makes sense to say that this independent motion can lead to good or evil, and that in many cases at least the motion is good when it is orderly and reasonable, "helped by mind." But beyond this there are enormous difficulties, some of them revealed by the Athenian's own words, some by the reactions of Klinias.

To begin with, the Athenian himself indicates that the proof that self-moved motion is the oldest and first cause of all motion is based on a "daring" premise of "most" atheists. If they did not hold this premise it is hard to see (*pace* Kant's "First Antinomy of Reason") what difficulties the atheists would encounter in believing that there has been an infinite regress of motion preceded by motion. It is true, an infinite regress of *causes* might seem to beg the question of cause (consider 894e), and this is part of the reason why the atheists lend themselves to being presented as the Athenian presents them here. As we have been (pp. 1065–1066, 1071 above), it transpires that the materialists' lack of concern for the unmovable and their emphasis on the priority in rank of things prior in time can be seen as common ground shared by the city in its reverence for the old — and the Athenian here makes full use of this possibility. But he does not himself endorse the "daring" premise of a beginning point for all motion. After all, it leaves quite unexplained the cause of the coming-into-being of the self-moved motion. Taken together with his abortive dialogue with the atheist, this lack of endorsement silently points to the possibility of another account in which the fundamental cause of the coming-into-being of all or some motion (self-moved or not) would be a thing or things not in motion and to that extent timeless, exerting force not through an original "push" but instead, perhaps, eliciting the motion of things in the form of a purpose. This might imply that some of the most recent motions are closest to the "first" cause. As we shall see presently, something more than the need to support the sanctity of the ancestral, forces the Athenian to ignore such a possibility in building his theology.

But granting the necessity for an original self-moved motion, we see, immediately that even this is not enough to establish any relation between the "oldest" cause and the old humanity or soul revered by the city. For why must the self-moved be nonmaterial? Why, for example, may not some matter be "explosive"? (Perhaps we have no experience of self-moved explosiveness because it exhausted itself in an original eruption.) Or why may not self-move-

[41] The Greek word *psychē*, lacking of course all specifically Christian connotations, can more easily be applied to nonhuman life than can our modern word "soul." The Athenian fully exploits the breadth or ambiguity of the Greek word.

[42] Cf. 631d5. The Greek may have been written " . . . *divine* in the true sense of the word . . . ," but on the major textual difficulty I follow the manuscripts and Burnet against all the emendations. For this use of *orthōs*, see *Phaedo* 67b4, 82c2–3, *Apology of Socrates* 40a3; Euripides *Alcestis* 637, *Hippolytus* 1169–70, *Andromache* 377–8, and see John Burnet, *Plato's Phaedo* (Oxford: Clarendon Press, 1963), commenting on 67b4. Stallbaum's discussion and proposed emendation are, however, cogent and attractive.

ment be a property of the elements when they are pure and unmixed — as they may have been in the beginning? The Athenian himself points to this latter possibility, but Klinias fails to take him up and ask how or when we could ever see self-moved motion in "unmixed" earth or fire or water (895c5). Instead Klinias suggests that the Athenian must mean that whenever we speak of self-moved motion we mean "life," and the Athenian, with a certain lack of enthusiasm, agrees (895c7–9).[43]

This leads straight into the most overt problem in the Athenian's proof of the gods' existence. After agreeing to identify self-moved motion with life, the two agree further that where there is life there is soul, and from this the Athenian commits the fallacy of arguing that soul must be defined as life. In so doing he ignores the different kinds of life and hence ignores the different kinds of soul, the defining species of soul. The rhetorical device he employs is a misleading analogy to mathematics: the division of all numbers into even and odd, as a proper division of the kinds of number, seems a model for the division of being into living and dead, or self-moved and moved by another. But numbers, unlike the natural species of things, are homogeneous: and evenness, unlike life, is an undifferentiated category.[44] Even Klinias finds it rather difficult to accept this "definition" of soul, but his eagerness to help win the argument prevents him from pressing his doubts.[45]

By abstracting from the *ideas* the Athenian is enabled to abstract from the *ideas* or forms of soul. He "mathematizes" the soul, or in other words he defines soul in terms of what is common to all soul. He adopts a version of the fundamental error of his opponents in order to draw a series of conclusions very different from theirs. Instead of reducing all complex and high manifestations of life to derivatives of lower, simpler life, he reads into all life, all soul, the capacities of the most complex, the human soul. He is therefore allowed to argue that the self-motion which is the source of all the motion in the cosmos must have been endowed with all the higher faculties of soul (896c9–d1).[46] More than that. Since he gives to every manifestation of soul the power possessed by the first cause of all motion, he can imply that all soul is simply dominant over body; he is able to forget the diversity of greater and lesser independence from body that different types of soul display. In particular, he can ignore the range of motions, from nutrition to pure reason, that exists within the human soul. He obscures the fact that much of the time soul is moved by body or in response to body, even in the most rational man. By obscuring this fact, the theology tends to assign to every man complete responsibility for his actions. It is true, soul becomes "good" only when it "takes *nous* as its helper," and the process by which this occurs is never spelled out. But we are left with the impresion that it is up to soul to choose whether or not it does so. Evil is ascribed entirely to soul, not to body, and as we have seen, the Athenian is stubbornly silent about chance. And all this applies to living things in general, not just to man. For all we know, any soul may "take *nous* as its helper" and begin to act divine: the theology "personifies" all life. As the Athenian says in conclusion, according to this theology "all things are full of gods" (899b9).

While the theology thus far does not promise personal immortality, and while it endows this particular city and its traditions with no special significance for the gods, it satisfies most of the major demands of *thumos*. Every man is called upon to assume his responsibilities and play his role in the struggle to overcome the evil sort of soul. There is even a sense in which the definition of soul as self-moved motion is a definition of the soul *as thumos*. If we recur to our earlier discussion of the basic dichotomy in the passions (*erōs* and *thumos*) and consider that dichotomy in the light of the twofold division of all motion, we see that *erōs* falls into the category of a motion moved by something outside itself, while *thumos* has among its properties not only a strong sense of self and of independence but a curious lack of any real object outside or beyond itself. The denigration of the moved motion that is *erōs* goes together with the forgetting of the eternal, unmoved things which are the ultimate objects and causes

[43] Contrast the other responses of the Athenian to Klinias's contributions, especially 894d5, 898c9.

[44] This is why there are for the Platonic Socrates no *ideas* of individual numbers (or of geometric entities), although there are *ideas* of odd and even. See *Republic* 510c–511a; Aristotle *Metaphysics* 987b14ff.; Jacob Klein, *Greek Mathematical Thought and the Origins of Algebra* (Cambridge: The MIT Press, 1968), pp. 56-7, 69ff. It appears that mathematics can be misleading as well as illuminating for the study of nature; the false mathematical physics goes with the neglect of the *ideas*.

[45] When the Athenian asks the crucial question, "Can we say the definition of soul is anything other than the motion with the power to move itself?" Klinias responds by repeating the question, as if he couldn't quite believe his ears ("Are you saying that . . . ?") — to which the Athenian replies hastily, "I say so, at least (*phēmi ge*), and if this is so, then . . . " (895e10–896a5).

[46] See the very just criticism by Paul Elmer More in *The Religion of Plato* (Princeton: Princeton University Press, 1921), p. 115.

of erotic motion and generation (cf. 721bff. and *Symposium* 210e–212a).

In the principal and seemingly most coherent part of his theology the Athenian honors motion at the expense of rest and thumotic motion at the expense of erotic motion. He makes everything akin to political man; he creates a cosmos filled with, moved by, responsible beings engaged in the mighty moral drama of a universal contest between active good and active evil. The "problem of evil" is not solved, here at any rate, by ascribing evil to chance, or to "ignorance," to a "lack" or a "falling-off" (contrast 857ff.); evil is presented as a daemonic force pervading the universe. This is a civil religion rich with themes for epic myth — a vast canvas waiting to be filled with the songs and dances and poetry of a people who love the moral without being moralists. In creating such a vision the Athenian imposes on the phenomena a splendidly simple and homogeneous order: all life, all motion, is divided into that which is rooted in the acts of the good kind of soul and that which is rooted in the acts of the bad kind of soul. However much the different species of beings seem unlike or unrelated to one another, in the most important respect every individual of every species can be understood as intimately allied with others, cooperating on one side or the other of the divine struggle.

Yet at the same time, in the very act of erecting this awesome mythic structure, the Athenian begins, through eloquent silences and fruitful errors, to describe another articulation of the whole. This articulation begins not from the homogeneity of beings and the consequent kinship of all things to the human soul, but rather from the essential heterogeneity of things and hence from the problematic, if not disorderly, character of the relation between the human and the nonhuman (and, within the human, between the soul and its parts and between the soul and the body). Such an interpretation places man much more at the mercy of indifferent or alien forces — forces he may call "chance" and which, in part at least, reflect the tension between the fundamental parts or "tribes" which compose the whole. Moreover, in severing the link between man's moral action and a cosmic struggle the Athenian's implicit cosmology necessarily diminishes the significance of political life: the city ceases to be so clearly the microcosm. On the other hand, the citizen who begins to face this situation as the true human situation may find himself filled with a new sense of incompleteness; a new longing may set his soul in motion, a longing that does not manifest itself in political action but in private action and thought. Such experiences, if and when they are introduced into a soul by the Athenian's paradoxes, are the first rungs on a ladder that leads beyond the "horizon" that makes even this city a kind of cave. The Athenian does not leave us in a position to say a great deal about the goal of the ascent. But this much seems suggested: what the climber seeks is to know clearly the unique and distinct cause or source of each of the various kinds of being (e.g., man, dog, star, etc.). And the Athenian hints that it is an error to expect these roots or fundamental causes to be reducible to one another or to some "first cause": they will rather be seen as a plurality, coexisting always, timelessly, although each is the cause of many things that "happen," that come into being in time.

To perceive this underlying teaching of the Athenian's theology we need not rely solely on implicit hints. Even on its surface, the theology is not simply a monument to *thumos*. In the last and seemingly least philosophic section the Athenian redresses the balance and in fact transforms dramatically the tone and content of the theology. Up until the discussion of the motion of *nous* we had been led to believe in the similarity of human and divine soul, and in their mutual concern for one another. Now we hear that *nous*, "god in the true sense of the word," has a motion of its own, different from all ten of the motions previously under discussion but more comparable to circular motion than to any of the other nine, including soul or self-moved motion (897e4ff.). Nothing is said as to the coming-into-being of the motion of *nous*. Like the circular motion which is its "image," *nous* remains in unchanging but ceaseless activity, "according to the same things, in the same way, around the same things, towards the same things, according to one reason and one order" (898a8–b1). This would seem to imply that as soul approaches the divine motion it becomes more preoccupied with the unchanging truth and pays less attention to temporal affairs.[47]

Having given *thumos* almost its due, the Athenian concludes by making the city revere as its greatest god a being which seems to look down on the petty comings and goings of men.[48]

[47] Compare Aristotle's comment in *On the Soul* 407a22–24: "If the circular movement is unending, there must be something which mind is always thinking — what can this be? For all practical thought has an end; it all goes on for the sake of something outside the process of thought."

[48] The Athenian shifts from saying that the gods "care for" the cosmos to saying that they merely "order" it: 897e7, 898c3–4, 898b8. See also Friedrich Solmsen, *Plato's Theology* (Ithaca: Cornell University Press, 1942), pp. 149–50, 162–3.

Even the second-ranked sidereal gods — the relation of whose bodies to the soul or souls which move them is left surprisingly ambiguous — act as if they were unaffected by what men do on earth. Men may feel gratitude for the regular cycle of days and seasons brought by the heavens; but there is not a hint that the gods ever interrupt their beautiful motions to bring fearful punishment to the wicked or special reward to the just.[49] The starry gods dwell in a visible but faraway place. And if circular motion is a reliable sign of the presence of gods, how much of the earth manifests any divine presence? Are there gods of a third rank who dwell on earth — or could it be that earth is that part of the cosmos where the wicked kind of soul without *nous* holds dominion? Little wonder that by the end of this refutation the Athenian feels compelled to go on and devote one and a half times as many pages to a proof of divine providence and justice. Never in that proof does he mention the astral gods; his argument is based on a deduction from the "virtues" of the gods, not their motions. But we must leave to another time any comment on the rich elaboration of the psychology of indignation and belief contained in those pages.

The Athenian's philosophic-poetic conclusion has rendered the theology as a whole profoundly ambiguous. We realize now that his purpose is not only to serve the thumotic needs of the city and the philosophic needs of the philosophers and potential philosophers. By making the city as a whole look up to the visible heavens not out of fear or hope but rather for the sake of the heavens' imagery of divine reason, the philosopher fills all the citizens with uncomprehending gratitude and awe for what is truly highest. He edifies his city; he adorns it by giving it the gift of the capacity to "sing the most beautiful song" (cf. 666d11, 668b4).

We are thus given an intimation of the Athenian's answer to the question always present but never explicitly addressed in the theology, the question of the good for soul — the common good which is the goal of the restless motion that is soul. The Athenian implies that the good at which souls aim insofar as they "take *nous*" is none other than the motion of *nous* (mind) itself, for its own sake. Mind, thought, is something of which any soul can partake without diminishing the share available for all other souls. Yet if this is the true common good, the conclusion is inescapable that the city as a whole does not partake of it except in a very diluted form. To this extent the pre-Socratics are right. The city can, however, honor or look up to the common good. Some kind of looking up, some sense of rank and sense of shame, is of the essence of the city. Piety is at home in the city, and the Athenian has proved that piety, when understood, can be led without violence to dedicate itself to a kind of reason. This is what the pre-Socratics failed to comprehend, and this is part of the reason why the issue is, as the Athenian later insists (966dff.), not the status of reason (*nous*) but the status of soul—soul which is understood not primarily as reason but as what it manifests itself to be, as piety. And this is why the science regarding soul is the same as the science regarding gods.

Longing to find a home for the mind liberated from the myths of the city and its gods, the pre-Socratics turned to the "whole nature." In abandoning themselves to that vast and silent cosmos they missed the fact that the whole is a "cosmos" only because it produces the city, for the city and its gods are in a sense the human soul, and the human soul is or can become the only natural home of the mind. But in order for this to happen the soul must be acted upon, and before that it must be understood. To understand the soul is to understand its gods; psychology and theology are in the end the same. The city and its gods can become the home of the mind to the degree that they can become the home of philosophy. How and to what extent this is possible, how and to what extent the city can "take *nous* as its helper," is shown by the Athenian more in deed than in word (cf. especially 897b1–2 with d5–6, the only reference to "justice" in the proof). The drama more than the argument of the *Laws* is Plato's theology.

[49] In order to see what the Athenian's presentation of the heavens omits, compare Critias, fragment 25, in Hermann Diels, ed., *Die Fragmente der Vorsokratiker*, 2 vols. (Berlin: Weidmannsche Buchhandlung, 1922): " . . . and then when the laws forbade them to commit open crimes of violence but they did them in secret, at that time it seems to me some clever and wise man invented fear of the gods for mortals in order that there would be terror for the wicked, even if they act or speak or think in secret . . . and he said that the gods dwelt in the place where, in speaking of it, he could most frighten man: the place from whence he knew that fears exist for mortals and rewards for a hard life, in the upper region, where men saw lightning and heard the dreaded thunder . . . and so with terror he surrounded mankind . . . " (my translation). Compare Solmsen, p. 35. The Athenian himself has not long before spoken of the fact that the gods kill men with lightning as a punishment: 873e. Cf. Xenophon *Memorabilia* IV iii 14 and Victor Goldschmidt, *La Religion de Platon* (Paris: Presses Universitaires, 1949), pp. 123ff.

Politicians in Uniform: Military Governments and Social Change in The Third World*

ROBERT W. JACKMAN
Michigan State University

A mild controversy has emerged in recent years concerning the possible effects of military rule on social change in Third-World countries. Some observers argue that, in the absence of other established social and political organizations, the military is likely to act as a progressive force, inducing economic growth and social change. Other analysts make a contrary argument, that political intervention by the military should essentially be seen as a conservative or even a reactionary activity by the defenders of the status of entrenched elite groups, designed to inhibit economic and social change. Still others have suggested that the social and economic policy consequences of military rule vary according to the type of society being considered.

The purpose of this paper is to assess empirically the validity of these contending hypotheses about the effects of military rule on social change for a sample of Third-World countries. Throughout the paper, the term "social change" is used broadly to include economic growth and social reform. In particular, social change refers to transformations of the type implied in such terms as "modernization," and "social mobilization,"[1] as well as to the transformations that may accompany the expansion of health, welfare, education, and related facilities. Finally, by "Third-World" I refer to non-Western, non-Communist-bloc countries in Africa, Asia, Latin America, and the Middle East.

[1] Marion J. Levy, Jr. defines modernization as a positive function of " . . . the ratio of inanimate to animate sources of power" (*Modernization and the Structure of Societies* [Princeton, N.J.: Princeton University Press, 1966], p. 35). Karl W. Deutsch defines social mobilization as "something that happens to large numbers of people in areas which undergo modernization, i.e., where advanced, non-traditional practices in culture, technology and economic life are introduced and accepted on a considerable scale" ("Social Mobilization and Political Development," *American Political Science Review*, 55 [September 1961], 493–514, at p. 493).

Theoretical Background

Perhaps the dominant theme of scholarly analyses of the 1950s and the early 1960s was that the military constitutes a modernizing force. Such an interpretation is of course consistent with the justifications for political intervention offered by the military themselves. Almost without exception, the leaders of *coups d'état* and new juntas declare that their action is necessary for national reconstruction and economic growth. Typically, they argue that political parties and civilian politicians have become corrupt and have monopolized social and economic resources, while the economy has stagnated and the "nation as a whole has suffered, allowing social antagonisms to emerge. Only a period of reformist military rule (at least "transitional") can correct these developments and thereby facilitate economic growth and modernization.[2]

Many social scientists have agreed with this prognosis. Thus, Marion Levy argues that in modernizing societies, the military is typically the organization that is most efficient at ". . . combining maximum rates of modernization with maximum levels of stability and control."[3] His case is predicated on the assumptions (a) that in the early stages of modernization competing organizations and institutions are weak or nonexistent; (b) that the military provides some of the few available channels for social mobility to attract the talent of emerging societies; (c) that the military is a rationally based organization with relatively sophisticated technological requirements; and (d) that "military

[2] On this point, see among others J. C. Hurewitz, *Middle East Politics: The Military Dimension* (New York: Praeger, 1969), p. 117; and Claude E. Welch, Jr., "The Roots and Implications of Military Intervention," pp. 1–59 in *Soldier and State in Africa: A Comparative Analysis of Military Intervention and Political Change*, ed. Claude E. Welch (Evanston, Ill.: Northwestern University Press, 1970), at p. 35. This theme is clearly dominant in news reports of military *coups* during the 1960s, as summarized in the sources cited in footnote 36 below.

[3] Levy, *Modernization and Structure*, p. 603.

technology is not radically different from the technology that is in general characteristic of modernization."[4] Levy hypothesizes that when these conditions converge (as is likely in Third-World countries), military governments will constitute a modernizing force.

The same argument has been advanced by others. For example, Lucian Pye suggests that the modernization of military organizations should produce spill-over effects:

> Above all else . . . the revolution in military technology has caused the army leaders of the newly emergent countries to be extremely sensitive to the extent to which their countries are economically and technologically backward. Called upon to perform roles basic to advanced societies, the more politically conscious officers can hardly avoid being aware of the need for substantial change in their own societies.[5]

Both Manfred Halpern and Guy Pauker reach similar conclusions concerning the Middle East/North Africa and Southeast Asia respectively, arguing that in these societies the officer corps usually have few ties with traditional "feudal" elites and that in fact many officers joined the military to escape the effects of the economic and social stagnation perpetuated by those traditional elites.[6] For these reasons, these analysts infer that military intervention in politics is likely to be a progressive force inducing modernization.

More recent studies have tended to question this general conclusion. While a similar emphasis is placed on the organizational characteristics of the military, the revisionists focus on different apects of the military's organizational structure. In particular, they make two arguments. First, it is argued that because military governments usually represent a relatively effective and disciplined organization, once they assume power they are primarily concerned with preserving and maintaining order in the wider society. Such goals are likely to become all-encompassing as it becomes clear how difficult they are to achieve. While the military may have enough organizational resources to overthrow an existing government, these resources are generally insufficient when it comes to the day-to-day business of governing and maintaining political stability. Thus, even if social change was proclaimed as the justification for the original intervention in politics, military governments are unlikely to have sufficient political and organizational skills to pursue modernizing policies; besides, they typically find that the organizational skills that they do possess are taxed to their limits by the problems of maintaining both general social order and control over competing political contenders (often from rival factions within the military iteslf).[7]

The second revisionist argument focuses on the corporate self-interest of the military. Here it is suggested that military governments are most likely to display a concern with maintaining or increasing the prerogatives and status of both the military and the middle class (from which the officer corps is drawn), even when such efforts conflict with the interests and aspirations of the wider society. Thus, military governments are likely to increase expenditures in the defense sector of the economy and at the same time to reduce the proportion of government expenditures allocated to civilian, non-defense programs. Similarly, these governments are unlikely to engage in programs that would help mobilize the lower classes, for to do so would be to create additional contenders for power and additional demands on resources, which would constitute a threat to both the middle class and their representatives, the officer corps.[8]

In short, the revisionists do not disagree with the argument that the military is often the most effective organization in Third-World countries. The first revisionist perspective, however, suggests that this in itself does not imply that military regimes have the political and organizational skills appropriate to the pursuit of modernizing policies even when such goals are proclaimed by these regimes. The second revisionist perspective goes further to question whether military regimes are even initially concerned with social reform, arguing instead that they are more typically concerned with protecting their own middle-class and corporate interests and with preserving social order than they are with social change. These scholars therefore conclude that military regimes are likely to act as reactionary forces, or at most as conservative forces inhibiting social change.

In an effort to reconcile these revisionist arguments with those of their predecessors, Samuel Huntington has argued that both cases are essentially correct, but that the specific outcome of military rule depends on the type of society being considered:

> As society changes, so does the role of the military. In the world of oligarchy, the soldier is a radical; in the middle-class world he is a participant and arbiter; as the mass society looms on the horizon he becomes the conservative guardian of the existing order. Thus, paradoxically but understandably, the more backward a society is, the more progressive the role of its military; the more advanced a society becomes, the more conservative and reactionary becomes the role of its military.[9]

In other words, Huntington suggests that the effects of military rule vary by degree of "backwardness." While he does not specify the meaning of backwardness in detail, his discussion implies that the term refers to the level of social and economic development. Where the initial level of development is low, military rule will have positive effects on rates of social change, since there will be few middle-class interests for the officer corps to protect. On the other hand, at higher levels of development military rule will tend to inhibit further social change, since in such countries middle-class interests are sufficiently well-developed so that the officer corps will protect those interests from encroachments by lower-class and peasant elements.

Huntington's hypothesis is of particular interest because support for the argument that military governments are conservative or reactionary comes disproportionately from students of Latin American politics, while support for the alternative view comes primarily from students of other Third-World countries. Note that when compared to other Third-World countries, Latin American societies are relatively "nonbackward." For one thing, they are much older than the other Third-World countries, in the sense that they generally achieved national independence in the nineteenth century as opposed to the post-Second-World-War period.[10] Similarly, the middle classes are much larger and politically more important in Latin American countries than in other Third-World countries.[11] Thus, Huntington's hypothesis is not as inconsistent with the earlier arguments as it may initially appear because it implies that military governments in Latin America tend to act as conservative forces protecting both their own corporate interests and those of the middle class. In other regions of the Third World, however, where the middle classes are less numerous and significant, his hypothesis implies that military governments are likely to constitute a more progressive social force, since they have few corporate and social interests to protect.

These various arguments have received relatively little systematic empirical comparative analysis. Some recent research on Latin American countries by Philippe Schmitter and Jerry Weaver[12] indicates that military rule has no

Change in the Non-Western States," *American Political Science Review*, 64 (December 1970), 1131–1148, at pp. 1134-1138.

[10] For data on this point, see Charles L. Taylor and Michael C. Hudson, *World Handbook of Political and Social Indicators*, 2nd ed. (New Haven, Conn.: Yale University Press, 1972), pp. 26–28.

[11] On this point, see the data on the "importance of the indigenous middle class" in Irma Adelman and Cynthia T. Morris, *Society, Politics, and Economic Development: A Quantitative Approach* (Baltimore, Md.: The Johns Hopkins University Press, 1967), pp. 30–33. Excluding Greece, Japan, Rhodesia, and South Africa from the calculations (which leaves us with 70 countries), the mean value for middle-class size is 70.7 for the 21 Latin American countries while the mean value for the remaining 49 countries is 46.5 (the scale ranges from 5 to 95).

[12] Philippe C. Schmitter, "Military Intervention, Political Competitiveness and Public Policy in Latin America: 1950–1967," pp. 425–506 in *On Military Intervention*, ed. Morris Janowitz and Jacques Van Doorn (Rotterdam, Netherlands: Rotterdam University Press, 1971); and Jerry L. Weaver, "Assessing the Impact of Military Rule: Alternative Approaches," pp. 58–116 in *Military Rule in Latin America: Function, Consequences and Perspectives*, ed. Philippe C. Schmitter (Beverly Hills, Calif.: Sage Publications, 1973).

liscernible social and economic policy consequences. As Schmitter puts it:

How much Latin American countries invest, industrialize, increase their GNP, raise their cost of living, increase their school enrollment and/or engage in foreign trade seems more the product of environmental or ecological factors than the willful acts of politicians grouped according to their competitiveness or civilian/military status.... In summary, no regime type seems to be exclusively responsible for "developmental success" in Latin America.[13]

Studies restricted to Latin America, however, cannot fully address either the Huntington hypothesis or indeed any hypothesis concerning the effects of military rule in nonindustrialized settings, since, as I have already noted, Latin American countries are not sufficiently heterogeneous in their levels of social and economic development. Eric Nordlinger's study, "Soldiers in Mufti," appears to be the only systematic analysis that goes beyond one region to consider a sample of all Third-World countries. His correlational analysis, based on data collected by Irma Adelman and Cynthia Morris,[14] essentially considers Huntington's hypothesis outlined above, and concludes that, subject to some small revision, Huntington is essentially correct.

The data . . . thus tend to bear out the hypothesis that the officers act in accordance with their class interests, either failing to act as modernizing agents or opposing economic and social change where the middle class is relatively wealthy and established — where change is presumably seen to involve the redistribution of economic privileges. . . . There is only one revision that ought to be made of Huntington's interpretation. Analysis of the Adelman and Morris data indicates that it is only at the very lowest levels of political participation and only in the context of a minuscule middle class that the officers sponsor modernizing policies.[15]

In the following section of the paper a fresh analysis of the impact of military rule on social change is presented. First, I specify a general model that allows an evaluation of the merits of the competing theoretical arguments reviewed above. Second, this model is applied to the Adelman and Morris data in order to reconsider the conclusions reached by Nordlinger with those data. Finally, the model is tested with a new set of data covering the decade from 1960 to 1970 for 77 independent countries of the Third World.

Analysis

The Model. To determine which (if any) of the competing hypotheses concerning the effects of military rule on social change is valid, we need a model that allows for three different sets of effects. First, the model should specify the direct additive effects of military rule on social change. Second, it should include parameters for the direct additive effects of the level of economic development (or degree of "backwardness") on social change. Third, in view of Huntington's proposition, the model should also permit the effects of military rule on social change to vary according to the level of economic development. As I shall show below, this final consideration involves the specification of a statistical interaction between military rule and level of economic development.

Given these considerations, the most appropriate analytic strategy involves a covariance analysis model, of the following form:

$$(1) \qquad Y = \alpha + \beta X + \sum_{i=2}^{n} \gamma_i Z_i + \sum_{i=2}^{n} \delta_i (XZ_i) + \epsilon,$$

where Y represents the amount of social change, X denotes the degree of political involvement by the military, Z_i represents the effect of the i^{th} level of economic development (there being a total of n such levels), XZ_i designates the effects of military rule within the i^{th} level of economic development, and ϵ is a stochastic disturbance term. In this model, X (the degree of military involvement in politics) is treated as a continuous variable, while the level of economic development is specified as a set of dummy variables (the Z_i) representing n discrete categories.

This specification is perhaps best understood with reference to a concrete example. Figure 1 presents one hypothetical set of estimates for the simple case where two levels of economic development are specified (i.e., where n assumes a maximum value of 2). Here, Z_2 is equal to 1 if the country is in the high level of economic development category, and zero otherwise. Given the inclusion of α and β in equation (1), and to avoid a linear dependency, γ_1 and δ_1 are constrained to a value of zero.[16] Thus, the

[14] Adelman and Morris, *Society, Politics, and Economic Development.*

[15] Nordlinger, "Soldiers in Mufti," pp. 1143–1144.

[16] On this point, see Daniel B. Suits, "Use of Dummy Variables in Regression Equations," *Journal of the American Statistical Association,* 52 (December 1957), 548–551. For general discussions of covariance analysis within the regression framework, see among others

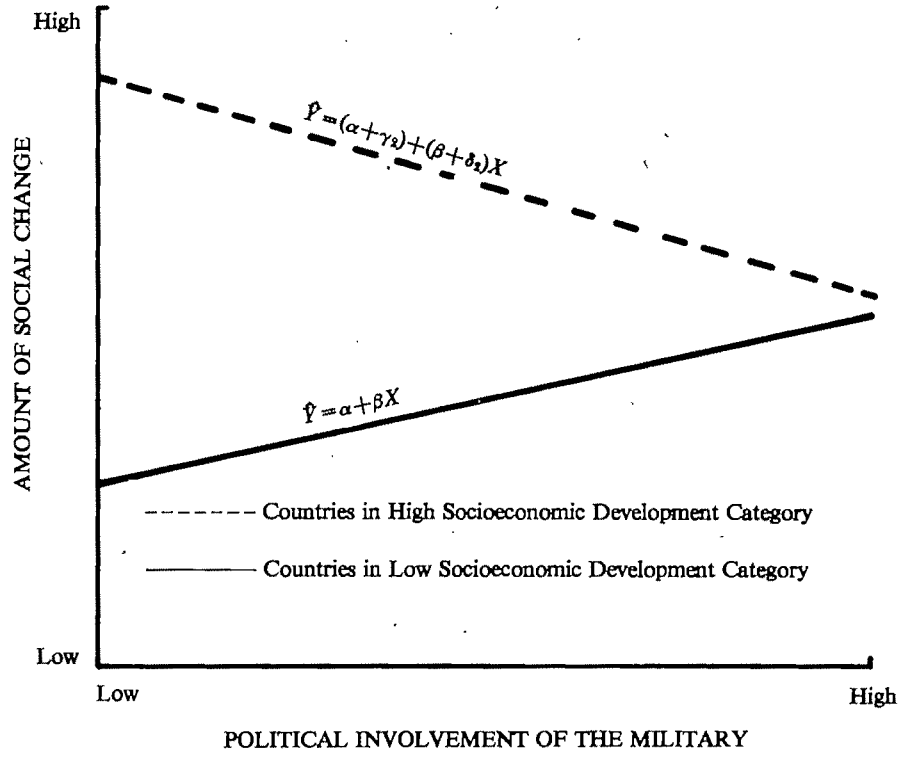

Figure 1. Hypothetical Effects of Military Rule on Social Change, by Level of Socioeconomic Development

hypothetical estimates in Figure 1 would, if true, be consistent with Huntington's hypothesis. At the low level of development, Z_2 equals zero, and so the third and fourth terms in equation (1) are also zero. Thus, for this category, the intercept is α and the slope (β) is positive, in line with Huntington's argument that in "backward" countries, military rule is a progressive force bringing "modernization." At the high level of development (when $Z_2=1$), there is not only an adjustment to the intercept, which for this category becomes $(\alpha+\gamma_2)$, but also an adjustment to the slope, which at the high development category is therefore $(\beta+\delta_2)$. In Figure 1 this adjusted slope is negative (δ_2 is therefore negative and approximately twice as large in absolute magnitude as β), which represents Huntington's argument that in this case, military rule is a reactionary force inhibiting modernization.

It should be emphasized that Figure 1 is wholly hypothetical and represents only one of many possible sets of estimates for equation (1). Thus, if the data were to be consistent with the proposition that military governments are a modernizing force regardless of societal type, we would expect a positive parameter estimate for β combined with estimates for the δ_i not significantly different from zero. The hypothesis of reactionary military-government effects implies the same pattern except that β is negative. Neither argument provides us with any expectations concerning the γ_1, which represent the additive effects of the level of economic development. The behavior of the estimates for the δ_i, however, is critical to the argument that the effects of military rule on social change vary with the level of economic development. Specifically, if Huntington's argument is correct, we would expect a pattern resembling that outlined in Figure 1, with positive military-government effects at lower levels of development and at least slightly negative military-government effects at higher levels of development. Finally, the null hypothesis (i.e., that there are no military-govern-

Jacob Cohen, "Multiple Regression as a General Data-Analytic System," *Psychological Bulletin*, 70 (December 1968), 218–231; Jan Kmenta, *Elements of Econometrics* (New York: MacMillan, 1971), 419–423; and J. Johnston, *Econometric Methods*, second ed. (New York: McGraw-Hill, 1972), 176–207.

ment effects) implies zero values for both β and the δ_i. Again, this hypothesis provides us with no expectations concerning the additive effects of the level of economic development, denoted by α and the γ_i.

Soldiers in Mufti: a Reexamination. In this section, the analysis of the covariance model just introduced is applied to data that were collected by Adelman and Morris;[17] these data were analyzed earlier by Nordlinger, who concluded that they are consistent with the proposition put forward by Huntington. The analysis that follows is based on the same variables and set of countries that were examined by Nordlinger.

To gauge the degree of military involvement in politics, Nordlinger used the Adelman and Morris classification of countries by what they call the "political strength of the military." This classification has the following three broad categories: (1) "Countries in which the military was in direct control during some part of the period 1957–62;" (2) "Countries in which the military was an important political influence but was not in direct political control during most of the period 1957–62;" and (3) "Countries in which the military had little or no political influence during the period 1957–62." Within these general categories, Adelman and Morris further subdivided countries according to the political strength of the military. For example, within the first category they distinguish beween countries where the military was in direct political control (a) for the *entire* period, (b) for *most* of the period, (c) for only one or two years in the period from 1957 to 1962.[18]

As indicators of modernization, Nordlinger took the following seven variables (the numbers in parentheses refer to the pages in Adelman and Morris on which these variables are described):[19]

1. *Leadership commitment to economic development, 1957 to 1962* (pp. 78–81). This variable has

> three broad categories on the basis of the following judgments: (1) whether the heads of government and semiofficial national agencies . . . involved in direct or indirect central guidance of the economy typically make concerted efforts to promote the economic growth of the country; (2) whether or not this planning effort includes purposive attempts to alter institutional arrangements that clearly block the achievement of development goals; and (3) whether or not there is a national plan and a planning group functioning within the government which is charged full time with executing the plan.

2. *Rate of growth of gross national product per capita in constant prices for the period 1950/51 to 1963/64* (pp. 87-90).

3. *Gross investment rate, 1957 to 1962* (pp. 93–96), calculated as the average ratio of gross investment to gross national product during this period.

4. *Change in degree of industrialization, 1950 to 1963* (pp. 99–100), defined as a composite of three statistical elements: "(1) the average annual rate of change in constant prices in industrial output (mining, manufacturing, electricity, and water) for the period 1950–63; (2) the change since 1950 in the proportion of gross domestic product originating in industry; and (3) the change since 1950 in the proportion of the total male labor force employed in industry."

5. *Improvement in agricultural productivity, 1950 to 1963* (pp. 107–108), "a composite variable based upon (1) judgments regarding the extent of use of mechanical power, fertilizer, and other modern techniques in agriculture cross-checked by quantitative data (where available and appropriate) on the use of tractors and fertilizer and (2) qualitative and quantitative information regarding the relative weights of traditional and modern agriculture."

6. *Change in the effectiveness of the tax systems, 1950 to 1963* (pp. 116–118), a composite variable consisting of three basic elements: (1) "The change in the ratio of government domestic revenue to GNP;" (2) "the average annual rate of increase in real government domestic revenue;" and (3) "the change in ratio of direct tax to total government domestic revenue."

7. *Rate of improvement in human resources, Circa 1957 to 1961* (pp. 123–126), defined in terms of two sets of school enrollment data: "enrollment at the second level of education as a percentage of the age group fifteen to nineteen and enrollment at the third level of education as a percentage of the appropriate age group."

Taking these seven measures of social and

[17] The Adelman-Morris data were originally collected for and are described in their book, *Society, Politics, and Economic Development*. The sample of countries consists of 74 non-Western, non-Communist countries, "which, as of 1950, were underdeveloped with respect to social and economic structure" and which, if not independent by 1962, were at least "recognized national units" (p. 9).

[18] For full details on this variable, see Adelman and Morris, pp. 74–76. The numerical scores for the variable are described on pp. 14–15.

[19] Numerical scores for the following variables are all described in Adelman and Morris, pp. 14–15.

economic change as his dependent variables, Nordlinger examined the extent to which they are affected by the degree of political strength of the military, within categories of economic development. Economic development was defined in two ways. First, Nordlinger took the Adelman-Morris measure of the importance of the indigenous middle class, defined as the percentage of the male labor force " . . . in commerce, banking, insurance, or in technical, professional, managerial, administrative, or clerical employments," circa 1960.[20] This variable is grouped into three levels of development: low (less than 10 per cent middle class), medium (between 10 and 19 per cent middle class), and high (more than 19 per cent middle class). Nordlinger's second index of the level of economic development is the Adelman-Morris measure of the "degree of modernization of outlook," circa 1960, which also has three categories. First, and in the highest level of development, are "countries in which the outlook of the urban educated population was significantly modernized, judging by the standards of less-developed countries, and in which programs of political, social, and economic modernization had gained significant support among both the urban and rural populations." Second are "countries in which the outlook of the urban educated population was significantly modernized but in which programs of political, social, and economic modernization had gained significant support only among the urban population." Third, and at the lowest level of development, are "countries in which the outlook of the educated urban sector was partially but not significantly modernized and in which programs of modernization, if they existed, had gained relatively little support among either the urban or rural population."[21]

5. Agricultural productivity growth rate	31.697* (6.008)	.277* (.118)	16.188 (9.511)	36.336* (9.091)	−.299 (.171)	−.382 (.196)	.236
6. Tax effectiveness growth rate	29.784* (7.177)	.275 (.142)	23.821* (11.362)	25.244* (10.860)	−.461* (.205)	−.179 (.234)	.153
7. Change in human resources	11.121 (6.250)	.415* (.123)	30.524* (9.894)	70.758* (9.456)	−.393* (.178)	−.573* (.203)	.541

Data are from Adelman and Morris, *Society, Politics, and Economic Development*, and are described in the text of this paper. Main table entries are the parameter estimates, and numbers below them in parentheses are their standard errors. Starred (*) estimates are more than twice their standard errors.

Nordlinger's analytic strategy was then to calculate zero-order correlation coefficients between the political strength of the military and each of the seven indicators of modernization, within the three categories of middle-class size and degree of modernization of outlook, respectively. This strategy generates a total of 42 correlation coefficients. In contrast, I shall fit the model specified in the last section to the same data, which gives fourteen sets of parameters to estimate. That is, there are seven different dependent variables (or seven alternative indicators for Y), and two three-category measures of the level of economic development (or two alternative versions of Z, each with $n=3$ categories). Finally, X is measured by the Adelman-Morris indicator of the political strength of the military.

The least-squares estimates for equation (1) with the Adelman-Morris data are presented in Tables 1 and 2. Table 1 reports the estimates for the regressions of the seven social-change indicators on the political strength of the military within the three categories of the importance (size) of the indigenous middle class, while Table 2 reports the same regressions within the three categories of degree of modernization of outlook.

From Table 1 it is clear that these estimates provide no support for *any* of the three main arguments outlined earlier in this paper, and they completely contradict the inferences that Nordlinger drew from the same data. First, none of the seven estimates for the political strength of the military (X) is significantly different from zero,[22] which means that we can

[22] A parameter estimate is considered statistically "significant" in this analysis if it is at least twice the size of its standard error of estimate: this criterion is the same as examining the t-ratios associated with each coefficient and rejecting those not statistically significant at approximately the .05 level. Strictly speaking, this test is not fully appropriate given that the sample of nations under consideration was not chosen randomly: however, it does provide a useful *a priori* criterion in view of the fact that I am not treating equation (1) as a fixed-effects model.

reject the arguments that military governments are *either* reactionary *or* progressive forces, regardless of the society's level of economic development (as measured by middle-class size). Recall that were either of these straightforward hypotheses correct, we would have expected statistically significant parameter estimates (either all positive or all negative) for the political strength of the military (β in equation [1]), combined with nonsignificant estimates for the two interaction terms (the δ_i in equation [1]). The pattern of the estimates in Table 1 clearly does not conform to these expectations. In addition, none of the estimates for the interaction terms is statistically significant, which indicates that the effects of military rule are not contingent on middle-class size.[23] Instead, the data show that social change generally varies according to the level of economic development, regardless of the political strength of the military. For example, rates of change in human resources (the seventh dependent variable) increase with size of middle class, from an average of 18.031 in the lowest category, through 50.765 in the middle category, to 79.396 in the highest middle-class size category.[24]

Essentially the same conclusions are implied by the estimates in Table 2. In five of the seven regressions, no consistent support is found for *any* of the three arguments discussed earlier. Rates of social change appear simply to depend on the level of development, as defined by degree of modernization of outlook, in these five regressions. In two instances, however (involving the second and seventh dependent variables: GNP per capita growth rate and changes in human resources, respectively), the data are partly consistent with Huntington's hypothesis and Nordlinger's conclusion. In these two cases, the parameter estimates for military rule are positive and statistically significant for countries in the low-development category, and the adjustments to those estimates (i.e., the δ_i) are negative and statistically significant for the countries in the highest development categories. Thus, for GNP per capita growth rates, the slope at the low level of degree of modernization is .343, while at the high level it is —.150 (i.e., .343 — .493). Similarly, for rates of change in human resources, the slope at the low level is .415, while at the high level it is —.158 (i.e., .415 — .573).

This, however, provides only partial support for Huntington's proposition, since the fact that the adjustments to the slopes are statistically significant does not imply that the adjusted slopes themselves are significantly different from zero. In fact, the above two adjusted slopes in the high-development category (i.e., —.150 and —.158) are *not* significantly different from zero.[25] Consequently, these estimates indicate that the effects of military rule on these two measures of social change do vary systematically across categories of level of modernization, but only in the sense that the effects are positive at the lowest level, while they are zero in the other two categories. This is indeed modest support for Huntington's argument, which implies negative, nonzero effects at higher levels of development. It also contradicts Nordlinger's analysis, which actually reports such negative effects for these two dependent variables.

Before discussing these results further, we should pursue a variation of this model suggested by Nordlinger that deals with possible regional (instead of level-of-development) effects. As noted earlier, there is substantial variation between geographic regions in mean levels of economic development: African countries are generally the least developed and Latin American countries are generally the most developed, while Asian and Middle East coun-

[23] Note that no parameters are estimated for Z_1 or XZ_1 (i.e., γ_1 and δ_1). This is consistent with the specification in equation (1) where γ_1 and δ_1 were constrained to a value of zero in order to avoid a linear dependency.

[24] These calculations are made by summing $(\alpha + \gamma_2)$ and $(\alpha + \gamma_3)$, respectively, since the γ_i are adjustments to the constant. Thus, the mean change in human resources for the lowest category of middle-class size is estimated by the constant (18.031); that for the intermediate category is (18.031 + 32.734); while the mean for the highest category is (18.031 + 61.365). For a discussion of dummy-variable regression analysis in terms of estimating conditional expectations, see Arthur S. Goldberger, *Topics in Regression Analysis* (New York: Macmillan, 1968), pp. 3–38.

[25] The statistical test for the adjusted slopes (rather than the adjustments themselves) is described in Johnston, *Econometric Methods*, at p. 179. Using the notation of equation (1) above, and focusing on the adjustment to β from δ_3, we first sum the estimates for the two coefficients $(\hat{\beta}+\hat{\delta}_3)$, and divide this sum by the estimated standard error

$$\sqrt{\text{var } \hat{\beta} + \text{var } \hat{\delta}_3 + 2 \text{ cov}(\hat{\beta},\hat{\delta}_3)}$$

where the three terms in the standard error are obtained from the variance-covariance matrix of coefficients. The standard error of the adjusted slope for GNP per capita growth rates in the high modernization category is .172, which is larger than the adjusted coefficient (—.150). Similarly, the standard error of the adjusted slope for rates of change in human resources in the high modernization category is .162, which is again larger than the adjusted coefficient (—.158).

tries tend to fall in between. Thus, if we treat geographic region as a proxy measure of the level of economic development, a regional-effects model offers an alternative procedure for examining further the arguments discussed above. If, for example, Huntington's argument is correct, we would expect the effects of military rule on social change in Africa to be positive, while we would expect those for Latin America to be negative. Additionally, we would anticipate no pronounced effects of military rule on social change in either Asia or the Middle East.

In examining possible regional effects, I have grouped the 74 countries into the same four regions defined by Nordlinger: the Middle East (including North Africa), Latin America, Asia, and Africa. But instead of calculating correlations between the political strength of the military and the seven indicators of social change within geographic regions, I have simply modified the model in equation (1) by redefining the Z_i (the level-of-development effects) to refer to regional effects.[26]

The regression estimates for the effects of the political strength of the military on the seven Adelman-Morris indicators of social change within these regions are reported in Table 3. As might be expected, in light of the estimates in the first two tables, they provide no support for the arguments that the military is either a modernizing or a reactionary force, regardless of geographic region. That is, none of the estimates of the effects of military political strength (X) is significantly different from zero. Of more interest is the fact that (with one possible exception) these results provide no support for a regional-effects model. For six of the seven dependent variables, none of the parameter estimates for the interaction terms is significant, which, combined with similar results for

[26] Thus, for the regional-effects models, Z has four categories. The Middle East (Z_1) is taken as the "excluded" category.

Table 3. Effects of Political Strength of the Military on Seven Indicators of Social Change, Within Regions, circa 1957 to 1963 ($N = 74$)

Dependent Variable	Constant	Military Strength (X)	Latin America (Z_2)	Asia (Z_3)	Africa (Z_4)	XZ_2	XZ_3	XZ_4	R^2
1. Leadership commitment to growth	46.653* (12.871)	−.155 (.225)	8.848 (16.286)	4.376 (19.758)	−5.900 (15.513)	.226 (.283)	−.019 (.338)	.232 (.348)	.087
2. GNP per capita growth rate	76.193* (11.645)	−.239 (.203)	−21.511 (14.734)	−26.293 (17.875)	−48.831* (14.035)	.236 (.256)	.237 (.305)	.693* (.315)	.191
3. Gross investment rate	56.819* (9.477)	−.196 (.165)	7.144 (11.991)	−7.698 (14.547)	−28.568* (11.422)	−.062 (.208)	−.031 (.249)	.237 (.257)	.255
4. Industrial growth rate	56.115* (13.415)	−.027 (.234)	−4.422 (16.973)	4.261 (20.592)	−47.964* (16.168)	.050 (.295)	−.084 (.352)	.510 (.363)	.293
5. Agricultural productivity growth rate	52.381* (10.041)	−.023 (.175)	1.027 (12.704)	18.720 (15.412)	−19.082 (12.101)	−.027 (.221)	−.281 (.263)	.524 (.272)	.136
6. Tax effectiveness growth rate	67.569* (11.150)	−.084 (.195)	−20.294 (14.108)	−11.265 (17.116)	−33.278* (13.439)	−.001 (.245)	.007 (.292)	.148 (.302)	.172
7. Change in human resources	63.228* (10.749)	−.094 (.187)	9.884 (13.600)	8.957 (16.499)	−51.121* (12.954)	−.166 (.236)	−.263 (.282)	.367 (.291)	.450

Data are from Adelman and Morris, *Society, Politics, and Economic Development*, and are described in the text of this paper. Main table entries are the parameter estimates, and numbers below them in parentheses are their standard errors. Starred (*) estimates are more than twice their standard errors.

X, means that military rule has no discernible impact on social change in any of the four geographic regions. Instead, the estimates for Z_4 simply indicate that, in general, African countries have slower rates of social change than other countries.

Only the estimates for GNP per capita growth rates suggest that the effects of military rule vary by region, and they thereby provide modest support for the Huntington argument. Here, the effects of military rule for African countries are positive,[27] while military rule has no impact on GNP per capita growth rates, one way or the other, in the other regions. Yet this is weak support for the regional-effects hypothesis, given that Huntington's argument implies negative military-government effects for the other regions and that Nordlinger actually reports such negative effects.

In short, Tables 1 through 3 provide little support for the Huntington hypothesis. Of a total of 21 sets of regression estimates, only three are even partly consistent with his argument, while the remaining 18 contradict it. To check on the robustness of the three sets of estimates that are partly congruent with the original argument, these estimates were recalculated using alternative measures of the dependent variables. The Adelman-Morris measure of GNP per capita growth rates was replaced with average annual rates of change in energy consumption per capita, 1960 to 1965, as reported in the recent *World Handbook of Political and Social Indicators*.[28] Similarly, the Adelman-Morris measure of rates of change in human resources (which, it will be recalled, is based on school enrollments) was replaced with average annual percentage rates of change in adjusted school enrollment ratios, 1960 to 1965, as reported in the same source.[29] All of

[27] Again, the slope here is given by summing β and δ_4, which, since the estimate for β is not significantly different from zero, gives $(0 + .693) = .693$.

[28] Taylor and Hudson, *World Handbook*, pp. 326-328. Data on GNP growth rates have too many cases with missing data for our purposes.

[29] *Ibid.*, pp. 225-228, for the 1965 country values. The 1960 series is available from the *World Handbook* data released by the Inter-University Consortium for Political Research (ICPR) at the University of Michigan. Average annual rates of change were calculated as follows:

$$\text{change} = [\ln(X_1/X_2)]\ [100/K],$$

where X_1 is the 1965 score; X_2 is the 1960 score; and K is the number of years between the two scores (in this case, 5). For details on the calculation of average annual rates of change, see George W. Barclay, *Techniques of Population Research* (New York: Wiley, 1958), pp. 28-33.

Table 4. Effects of Political Strength of the Military on (a) Two Indicators of Social Change Within Categories of Degree of Modernization, and (b) One Indicator of Social Change Within Regions, circa 1957 to 1965 (N=72)

Dependent Variable	Constant	Military Strength (X)	Medium Modernization (Z_2)	High Modernization (Z_3)	XZ_2	XZ_3	R^2
1. Energy consumption per capita growth 1960–65	6.282* (1.573)	.001 (.031)	−1.029 (2.520)	1.000 (2.338)	−.023 (.044)	−.059 (.050)	.067
2. School enrollment growth 1960–65	8.073* (1.316)	−.057* (.026)	−4.432* (2.151)	−6.415* (1.993)	.043 (.038)	.034 (.043)	.239

Dependent Variable	Constant	Military Strength (X)	Latin America (Z_2)	Asia (Z_3)	Africa (Z_4)	XZ_2	XZ_3	XZ_4	R^2
1. Energy consumption per capita growth 1960–65	5.888* (2.406)	−.015 (.420)	.277 (3.104)	−.050 (3.694)	1.360 (2.927)	−.019 (.534)	.026 (.063)	−.465 (.655)	.057

Independent variables are defined as in Tables 2 and 3. The dependent variables are described in Charles L. Taylor and Michael C. Hudson, *World Handbook of Political and Social Indicators*, second edition (New Haven, Conn.: Yale University Press, 1972), and in the text of this paper. Missing data on the dependent variables reduces the N from 74 to 72.

the independent variables are defined as in Tables 2 and 3 above.

Table 4 presents the results of these recalculations. The revised parameter estimates are again inconsistent with the Huntington hypothesis. First, none of the parameter estimates for the interaction terms is significantly different from zero. Second, only one of the three parameter estimates for the political strength of the military (i.e., that for school enrollment growth) is more than twice the size of its standard error. This, of course, is inconsistent with Nordlinger's conclusion; besides, the simple bivariate regression of school enrollment growth on the political strength of the military produces a parameter estimate that is less than twice the size of its standard error (along with an R^2 of .033). Thus, the results in Table 4 are consistent with the 18 sets of parameter estimates in Tables 1 through 3, which show that military governments have little systematic impact on social change, regardless of societal type. In short, Table 4 indicates that the three apparent exceptions in the earlier tables to this general statement are not particularly robust, in the sense that they cannot withstand even a modest attempt at replication.

That this reanalysis of the Adelman-Morris data contradicts the earlier analysis by Nordlinger deserves comment. Essentially, the difference is due to Nordlinger's reliance on correlation coefficients calculated separately within level-of-development and regional categories, as opposed to my reliance on the metric (or unstandardized) regression coefficients, using an analysis of covariance model that explicitly specifies and allows for level-of-development and regional effects. The covariance model in equation (1) is superior to Nordlinger's procedure because it allows for statistical tests of difference (the t-ratios) across categories of the within-category slopes (i.e., the regression coefficients). This means we have been able to subject the proposition that the effects of military rule on social change vary by either region or level of development to tests of statistical significance.[30]

In addition, correlation coefficients are not particularly useful in this context, since, as standardized statistics, they are sensitive not only to changes in the "true" underlying relationship, but also to the ratio of the variances of each pair of variables being considered. This sensitivity becomes potentially troublesome for analyses like Nordlinger's, which compares the size of bivariate correlation coefficients between the same pairs of variables across discrete groups of countries. That is, Nordlinger stratified the 74 countries into three separate categories (on the basis of level of development) and then compared within-stratum correlation coefficients across strata. The problem here is that the ratio of the within-stratum standard deviations of the variables involved also varies across these strata, which directly affects the within-stratum correlation coefficients. Thus, Nordlinger's correlations are themselves subject to artificial fluctuations, in the sense that, in addition to possible cross-strata variations in the true underlying relationships, they also reflect cross-strata variations in the ratios of the within-stratum variances (or standard deviations).[31] In contrast, comparisons across strata

[30] In addition, by retaining all of the observations in the analytic design, the number of degrees of freedom retained for these tests is maximized, as it would not have been had separate regressions been estimated within each level-of-development or regional category. On this point, see Kmenta, *Elements of Econometrics*, at p. 421.

[31] For general discussion on this point, see among others John W. Tukey, "Causation, Regression, and Path Analysis," chapter 3 in *Statistics and Mathematics in Biology*, ed. Oscar Kempthorne et al. (Ames, Iowa: Iowa State College Press, 1954); and H. M. Blalock, Jr., "Causal Inferences, Closed Populations, and Measures of Association," *American Political Science Review*, 61 (March 1967), 130–136.

To illustrate the differences involved here, consider the following table, which reports the within-region relationships between the Adelman-Morris measure of "changes in human resources" (i.e., school enrollment ratios, designated here as y) and their measure of the political strength of the military (designated here as x):

Region	r_{xy}	=	s_x/s_y	×	b_{yx}
Latin America	–.435		1.676		–.260
Asia	–.342		.961		–.356
Africa	.336		1.229		.274
Middle East	–.115		1.229		–.094

Note that the ratio of the within-stratum standard deviations does in fact vary substantially across strata (from .961 to 1.676), and that this in turn substantially affects the relative magnitudes of the coefficients. Where the correlation coefficients suggest that the strongest (negative) effect of military rule on changes in enrollment ratios occurs in Latin America, the regression coefficients show the strongest effect occurring in Asia.

Incidentally, while I have been able to reproduce the Adelman-Morris zero-order correlations (reported in *Society, Politics, and Economic Development* at pp. 281–283), I have had more difficulty reproducing the within-stratum correlations reported by Nordlinger in his Tables 2, 3, and 4. My estimates are close to his in the cases of the third and fourth tables, and the mean differences between the (absolute) magnitudes of his correlations and mine are .010 and .011 for his tables 3 and 4 respectively. However, the mean difference between the absolute size of the correlations in his Table 2 and mine for this table is .079.

of the metric regression coefficients generated with a covariance analysis model are not subject to distortion from variation in within-stratum variances, and they therefore offer a more meaningful basis for the comparison of the nature of the true effects.

These considerations, along with the empirical results of this section, indicate that the Adelman-Morris data provide little support for the conclusions that Nordlinger has drawn from them. Unfortunately, these data themselves have serious limitations, which means that they cannot be used to generate an overwhelming challenge to Huntington's original hypothesis. First, while the independent variables (and in particular the political strength of the military) cover the period from 1957 to 1962, many of the dependent variables cover the period from about 1950 to 1963. The temporal problem with these data clearly impedes our ability to consider the effects of military involvement in politics on social change.[32]

Second, the 74 observations in the Adelman-Morris data file include three countries not normally considered part of the Third World (Greece, Japan, and South Africa), as well as 22 others that had not achieved political independence by January 1, 1960 (in spite of the fact that most of the variables cover the period 1957 to 1962, and some of them span the 1950 to 1962 period). While national sovereignty may not have been important to the analytic purposes for which Adelman and Morris originally collected these data, it clearly is critical to the hypotheses at hand. In particular, it is difficult to visualize indigenous military governments within the colonial setting.[33] To be sure, a reanalysis of these data with non-Third-World and nonindependent countries excluded (which reduces the N to 49) does not alter the conclusions of this section (the estimates are not reported here). On the other hand, these exclusions leave only five African countries in the sample, which makes regional comparisons impossible. The exclusions also remove a large proportion of the poorest Third-World countries from consideration, even though these countries are important to an evaluation of Huntington's hypothesis.

Finally, there is reason to believe that the Adelman-Morris measure of the political strength of the military is not particularly suited to our present purposes. In particular, intermediate values on this variable were assigned to countries " . . . in which the military was an important political influence *but was not in direct political control.*"[34] Most of the studies discussed in the first part of this paper, however, considered the effects of *direct* military intervention and political control on social change. Direct control is also critical to the claims typically made by the military themselves after *coups d'état*: such action is usually justified on the grounds that it is necessary to remove the existing ineffective or corrupt political leaders before social change can occur, and that only a period of military rule (at least temporary) can "clean up" politics in this manner and then initiate social change. Of course, the armed forces have to constitute "an important political influence" before they can mount successful *coups,* but such influence is not synonymous with direct political control. Given the hypotheses under consideration, a preferable measure would identify the duration of military governments that initially achieved direct political control through extra-constitutional means.

In short, these considerations imply that while Nordlinger's inferences are incorrect, the arguments put forward by Huntington have yet to be systematically evaluated. The next section of this paper attempts such an evaluation with more recent data that do not suffer from the limitations just discussed.

Military Governments and Social Change, 1960 to 1970. We now apply the model in equation (1) to data covering the ten-year period from 1960 to 1970 for the 77 independent Third-World countries listed in the Appendix.[35]

The measure of political intervention by the military emphasizes the duration of their direct control of the machinery of government. To be included in the index, such control had initially to take the form of an irregular, extra-constitutional power transfer — that is, a military *coup d'état.* This criterion is obviously important if we are to distinguish regimes such as the one headed by General Ne Win of Burma from that headed by General Dwight Eisenhower of the United States. Duration of military rule was then coded (in months) for the period from December 31, 1960 to December 31, 1970, so

[32] Nordlinger also notes this problem in his preliminary discussion ("Soldiers in Mulfti," p. 138).

[33] This is also a problem with a more recent analysis that has come to my attention as this paper is going to press. See R. D. McKinlay and A. S. Cohan, "A Comparative Analysis of the Political and Economic Performance of Military and Civilian Regimes: A Cross-National Aggregate Study," *Comparative Politics,* 8 (October 1975), pp. 1–30.

[34] Adelman and Morris, *Society, Politics, and Economic Development,* p. 75. Italics added.

[35] To be included in the analysis, countries had to be independent before December 31, 1962.

that the maximum possible score is 120. In addition, military regimes were counted as starting on December 31, 1960 if a *coup* occurred before that date but the chief executive installed at the earlier time remained in power into 1961, as did General Ayub Kahn of Pakistan. Finally, if elections occurred ("rigged" or otherwise) but were won by the incumbent from the officer corps who had originally gained power through a *coup d'état*, such elections were not counted as interruptions to the period of military rule. This procedure is required because for one thing, it is in general quite difficult to judge the extent to which elections are "rigged," and for another, military regimes that initially seize power through extra-constitutional means may often enjoy considerable popular support. Cases in point where elections took place within military regimes include the regimes of General Barrientos in Bolivia and of General Pak Chung Hi in South Korea.[36]

To gauge the extent of social change over the same period, I have relied on four distinct measures. The first of these is the average annual percentage change in energy consumption per capita, 1960 to 1970, expressed in kilograms per capita of coal-equivalent energy.[37] As an indicator of economic growth, this reflects the same kind of change that is captured by four of the measures of economic growth employed by Nordlinger.[38] In particular, it reflects changes in the degree of industrial growth and in the degree of productivity of the economy as a whole. Besides, it is consistent both with Levy's discussion of modernization mentioned at the outset of this paper and with Deutsch's concept of social mobilization.

As a second indicator of social change, I have taken average annual percentage changes in school enrollment ratios, 1960 to 1970. These data are available from UNESCO, which defines the "enrollment ratio" as " . . . the total enrollment of all ages divided by the population of the specific age groups which correspond to the age groups of primary and secondary schooling. The result is expressed as a percentage. These ratios have been calculated taking into account the differing national systems of education and the duration of schooling at the first and second levels."[39] This variable measures the same aspect of social change as is measured by the rate of improvement in human resources, which was the last of Nordlinger's seven indicators of social change.

The third measure registers changes in health care. Specifically, it consists of the average annual percentage change in the number of physicians per 1,000 population, from 1960 to 1970.[40] While this variable taps a dimension of social change that differs from the other two variables just introduced, it does reflect an im-

[36] The primary data source for this variable is *Keesing's Contemporary Archives* (London: Keesings, Ltd.), which is published weekly. This source was also cross-checked against others, including the country profiles in Donald G. Morrison, Robert C. Mitchell, John N. Paden, and Hugh M. Stevenson, *Black Africa: A Comparative Handbook* (New York: Free Press, 1972), the data in Kenneth Ruddle and Philip Gillette, *Latin American Political Statistics* (Los Angeles: Latin American Center, UCLA, 1972), the data on coups in William R. Thompson, *The Grievances of Military Coup-Makers* (Beverly Hills, Calif.: Sage Professional Papers in Comparative Politics, 01-047, Sage Publications, 1973), at pp. 68–70, along with the papers in the following books: *The Politics of the Coup D'Etat: Five Case Studies*, ed. William G. Andrews and Uri Ra'anan (New York: Van Nostrand Reinhold, 1969); Bienen (ed.), *The Military Intervenes;* and Janowitz and Van Doorn (eds.), *On Military Intervention*. The cross-checking indicates that the primary source is quite accurate: in no cases were the data in *Keesing's Contemporary Archives* contradicted by the other sources.

[37] The 1970 data are from United Nations, *Statistical Yearbook 1971* (New York: Statistical Office of the U.N., 1972), pp. 336–339 and United Nations, *Statistical Yearbook 1974* (New York: Statistical Office of the U.N., 1975), pp. 359–362. The 1960 data are described in Taylor and Hudson, *World Handbook*, and reported in the series released by the ICPR at the University of Michigan. This second source was also cross-checked against the data in the United Nations *Statistical Yearbook* of 1961, pp. 278–280. Average annual rates of change were calculated as described in footnote 29, where X_1 is the 1970 score; X_2 is the 1960 score; and K is the number of years between the two scores (in this case, 10).

[38] Recall that these measures of social change were: GNP per capita growth rates; gross investment rates; industrial growth; and improvements in agricultural productivity.

[39] UNESCO, *Statistical Yearbook 1971* (Paris: UNESCO, 1972), p. 99. Data for both 1960 and 1970 are from the 1971 *Statistical Yearbook*, pp. 101–119, and from the UNESCO *Statistical Yearbook* of 1972, pp. 93–114. Average annual rates of change were again calculated as described in footnote 29 above: in a few cases 1968 or 1969 data were substituted for (unavailable) 1970 scores, and in these cases K assumed a value of 8 or 9, instead of 10. Data for Taiwan are missing.

[40] Data for the total number of physicians (1960) are from the ICPR version of the *World Handbook* and from the United Nations *Statistical Yearbooks* of 1962, 1963, 1964 and 1965. Discrepancies between these two sources were resolved in favor of the second one. Population data for 1960 are also taken from the ICPR version of the *World Handbook*. The 1960 physicians per 1,000 population ratios were generated from these variables. The 1970 physicians per 1,000 population ratios are derived from the United Nations *Statistical Yearbooks* of 1971, 1972, and 1973 at pp. 711–714; 747–750; and 719–722 respectively. Average annual rates of change were calculated as described in footnotes 29 and 39 above.

Table 5. Intercorrelations Among the Four Indicators of Social Change, 1960 to 1970[a]

	1	2	3	4
1. Energy consumption growth	1.000	.415	.119	.116
2. School enrollment growth	76	1.000	.141	.267
3. Physicians per 1,000 population growth	77	76	1.000	.118
4. Radios per 1,000 population growth	75	75	75	1.000

[a] The data and their sources are described in the text of this paper. Entries in the upper diagonal are pair-wise product-moment correlation coefficients; entries in the lower diagonal indicate the number of cases on which these coefficients are based. Data for variable 2 are missing for Taiwan, and data for variable 4 are missing for Taiwan and Yemen.

portant aspect of physical well-being that has subsequent effects on other aspects of well-being, such as infant mortality and life expectancy rates (for which, unfortunately, data on a sufficiently wide scale are as yet unavailable). In addition, for reasons discussed elsewhere, this variable reflects changes in part of the *distribution* of health benefits (an important material good), in the sense that higher ratios imply greater health benefits for the less wealthy.[41] At the same time, changes in physician-to-population ratios do share with changes in both energy consumption rates and school enrollment ratios a characteristic that is important to the hypotheses of this analysis, because all three of these variables are potentially available for fairly rapid manipulation by policy makers. In contrast, for example, even successful programs designed to decrease infant mortality rates may take a much longer time before their effects are readily discernible.

The final measure reflects changes in access to the mass media, in this case, radios.[42] The growth of the mass media generally reflects growth in the proportion of the population that is mobilized, with obvious implications for social and political change.[43] My focus on changes in the ratio of radio receivers to population is relevant for two reasons. First, this is a variable that is potentially capable of considerable growth at a rapid rate, even in non-industrialized societies. Second, radios can be an effective form of mass communication in the absence of a literate population.

I should emphasize that these four variables are not intended to serve as a unidimensional index of "social change." Indeed, as Table 5 shows, the empirical interrelationships among these variables are quite modest. Changes in per capita energy consumption rates are modestly associated with changes in school enrollment ratios, while each of these variables in turn is very weakly related to changes in both physician- and radio-to-population ratios. There are, however, no compelling theoretical reasons for assuming that social change is unidimensional. In fact, rapid economic growth may be incompatible (in the short run, at least) with some of these other facets of social change, for the reasons outlined by Mancur Olson, and others.[44] Thus, the four variables I have just introduced allow us to examine the effects of military rule on four *distinct aspects* of social change.

In addition to these data on both social change and military intervention in politics, a measure of the *level* of economic development is required before we can estimate equation (1). Here I have relied on the level of energy consumption per capita (again expressed in kilograms of coal equivalents) for 1960. The 1960 data were chosen so that we may examine the effects of military rule on social change during the subsequent decade given the *initial* level of economic development. This measure is, of course, highly correlated with others, such as gross national product or gross domestic product per capita, but it has the practical advantage over them of presenting us with no

[41] See Robert W. Jackman, *Politics and Social Equality: A Comparative Analysis* (New York: Wiley-Interscience, 1975), especially chapter 2.

[42] Data for radio receivers per 1,000 population for 1960 and 1970 are from the UNESCO *Statistical Yearbooks* of 1972 and 1973 at pp. 840–849 and pp. 732–737 respectively. Some 1960 values are from the ICPR version of the *World Handbook*. Average annual rates of change were calculated as described in footnotes 29 and 39 above.

[43] Cf., Deutsch, "Social Mobilization and Political Development."

[44] Mancur Olson, Jr., "Rapid Growth as a Destabilizing Force," *Journal of Economic History*, 23 (December 1963), 529–552.

cases of missing data. In the following analysis the raw scores for countries have been grouped into three categories: countries with a 1960 energy consumption rate of less than 75 kilograms per capita ($N = 30$) were assigned to a low category; those with energy consumption rates from 75 to 250 kilograms per capita ($N = 24$) were assigned to the intermediate category; and those with energy consumption rates greater than 250 kilograms per capita ($N = 23$) were placed in the high category.[45]

The least-squares estimates of equation (1) based on these data are reported in Table 6. They provide little consistent support for any of the hypotheses reviewed in the first section of this paper. First, the models for the first and fourth dependent variables (growth rates of energy consumption per capita and the radio to population ratio) provides no non-zero estimates for either the direct effects of military rule (X_1) or the adjustments to the slopes (i.e., the XZ_i terms). Second, in the case of growth in the physicians-to-population ratio, the estimate for XZ_2 suggests that military rule may result in social change among countries at intermediate levels of development ($N = 24$). This result, however, is inconsistent with any of the three basic arguments discussed earlier. Besides, the estimates of a revised model that includes only those independent variables for which the estimates in the third row of Table 6 were more than twice their standard errors produce an insignificant parameter value for the term in XZ_2. This suggests that the estimate of that parameter in the third row of Table 6 is not robust.

Only the estimates for the second dependent variable appear consistent with one of the earlier arguments, insofar as they suggest that military governments inhibit growth in school enrollment ratios, regardless of the level of economic development. To pursue this possibility, I estimated a modified version of equation (1), with both of the interaction terms (i.e., the δ_i) set to zero. This revised model produced significant estimates for all coefficients *except* β. The modified estimates thus provide no support for even the simple argument that military juntas systematically affect growth in school enrollment ratios.[46]

[45] See footnote 37 above for the 1960 energy consumption per capita data sources. This classification provides three categories of approximately equal size. In addition, the cutoff points coincide with "breaks" in the data, in the sense that no country falls within ±5 kilograms (of energy consumption per capita) of the cutoff points.

[46] The modified model produced the following estimates (with standard errors in parentheses): $\hat{\alpha} = 6.505$ (.582); $\hat{\beta} = -.013$ (.008); $\hat{\gamma}_2 = -2.462$ (.776); $\hat{\gamma}_3 = -3.672$ (.792); $R^2 = .257$; $\bar{R}^2 = .226$. I also estimated a model with both β and the δ_i set to zero, for which the estimated $\bar{R}^2$ is .212, which is very close to the $\bar{R}^2$s for either of the more complete models (for a definition and discussion of $\bar{R}^2$, see, e.g., Kmenta, *Elements of Econometrics*, at p. 365).

Table 6. Effects of Military Intervention in Politics on Three Indicators of Social Change, 1960 to 1970, Within Categories of 1960 Level of Economic Development ($N = 77$)

Dependent Variable	Constant	Military Intervention (X)	Medium Development (Z_2)	High Development (Z_3)	XZ_2	XZ_3	R^2
1. Energy consumption growth	7.345* (1.123)	−.009 (.022)	−1.054 (1.634)	−2.115 (1.655)	−.036 (.036)	.0002 (.033)	.078
2. School enrollment growth[a]	6.955* (.664)	−.027* (.013)	−3.002* (.967)	−4.557* (.998)	.018 (.021)	.028 (.019)	.280
3. Physicians per 1,000 population growth	4.760* (.956)	−.014 (.019)	−2.576 (1.392)	−3.580* (1.410)	.066* (.031)	.045 (.028)	.135
4. Radios per 1,000 population growth[b]	14.702* (2.057)	.054 (.042)	−8.116* (2.995)	−11.420* (3.090)	−.028 (.067)	.018 (.061)	.290

The data and their sources are described in the text of this paper. Main table entries are the parameter estimates, and numbers below them in parentheses are their standard errors. Starred (*) estimates are more than twice their standard errors.

[a] School enrollment data for Taiwan are missing, so the estimates in this row of the table are based on an N of 76.

[b] Radios per 1,000 population data are missing for Taiwan and Yemen, so the estimates in this row are based on an N of 75.

Table 7. Effects of Military Intervention in Politics on Three Indicators of Social Change, 1960 to 1970, Within Regions ($N=77$)

Dependent Variable	Constant	Military Intervention (X)	Latin America (Z_2)	Asia (Z_3)	Africa (Z_4)	XZ_2	XZ_3	XZ_4	R^2
1. Energy consumption growth	6.711* (1.451)	−.037 (.028)	−2.700 (1.906)	−.274 (2.096)	2.125 (1.875)	.037 (.039)	.052 (.036)	−.053 (.045)	.173
2. School enrollment growth[a]	3.975* (.874)	−.014 (.017)	−2.297* (1.149)	1.535 (1.303)	2.982* (1.130)	.028 (.024)	−.002 (.022)	−.017 (.027)	.331
3. Physicians per 1,000 population growth	1.861 (1.359)	.022 (.026)	.433 (1.786)	.388 (1.964)	2.277 (1.757)	.011 (.037)	−.005 (.034)	−.019 (.042)	.064
4. Radios per 1,000 population growth[b]	3.716 (2.836)	.091 (.057)	1.646 (3.726)	10.276* (4.226)	7.580* (3.666)	−.107 (.079)	−.045 (.073)	.011 (.089)	.279

The data and their sources are described in the text of this paper. Main table entries are the parameter estimates, and numbers below them in parentheses are their standard errors. Starred (*) estimates are more than twice their standard errors.

[a] School enrollment data for Taiwan are missing, so the estimates in this row of the table are based on an N of 76.

[b] Radios per 1,000 population data are missing for Taiwan and Yemen, so the estimates in this row are based on an N of 75.

In addition to these results concerning military rule, Table 6 shows that average annual rates of change in energy consumption per capita are not sensitive to the initial level of economic development. The remaining three measures of social change, in contrast, do vary (inversely) with level of economic development, so that countries at lower levels of development have higher rates of growth, while those in the highest development category have the lowest rates.

Table 7 reports the parameter estimates for a variant on equation (1) that specifies the possible effects of military governments on social change within geographic regions. Countries have been grouped into the same four regions that were identified in Table 3: the Middle East (and North Africa), Latin America, Asia and Africa.[47] Recall that the rationale for examining possible regional differences is that these groups of countries vary in their average levels of economic development, with African countries as a group being the poorest and Latin American countries being the least poor.[48] If the estimates in Table 7 were to support Huntington's hypothesis, we would anticipate that military rule promotes social change in African countries while it retards such change in the other regions (including Latin America in particular). The estimates in Table 7 provide no support for this argument. None of the estimates for the effects of military rule (i.e., β and the δ_i) is significantly different from zero, which is consistent with the inferences drawn from Table 6.

It might be objected that these results are distorted because the distribution of X (duration of military rule) is skewed, since only 36 (46.8%) of the 77 countries listed in the Appendix have non-zero (positive) values on this variable. This raises the possibility that the variance of the disturbance in each of the models I have estimated is heteroskedastic (i.e., not constant for all observations).[49] More specifically, it is likely that the variance of the disturbance for $X = 0$ is greater than the variance of the disturbance when X assumes other

[47] The countries are classified by the four regions described in the Appendix.

[48] This expectation is borne out in the regional mean values for energy consumption per capita, 1960. The regional means are: Africa, 50; Asia, 126; Middle East, 336 (this figure excludes Kuwait: with Kuwait included, the Middle East mean is 714); Latin America, 582.

[49] A key assumption of the ordinary least squares estimates of equation (1) is homoskedasticity, which implies

$E(\epsilon_j^2) = \sigma^2$ for all j (where the subscript j refers to the j^{th} observation). When this assumption is not met, the disturbances are said to be heteroskedastic, which implies

$E(\epsilon_j^2) = \sigma_j^2$

Although the ordinary least-squares estimates are unbiased and consistent under heteroskedasticity, they are not efficient. This means that the estimated standard errors are biased (for a useful discussion of this problem, see Kmenta, *Elements of Econometrics*, pp. 249–269).

values. To pursue this possibility, I re-estimated the models in Tables 6 and 7, excluding the 41 countries that experienced no military juntas.[50] The results of this reanalysis, along with a visual inspection of the appropriate scatterplots, indicate that the estimated standard errors reported in Tables 6 and 7 are not biased.

One final possibility deserves consideration. The measure of political intervention by the military is based on the duration of direct military rule. It does not, however, distinguish between uninterrupted military rule and a series of intermittent military governments. For example, two countries could have the same score on this variable (say, 75), but in the first country this count is based on a continuous 75-month period of military government, while in the second the same score reflects the presence during the decade of three distinct military governments, each of which lasted for 25 months.[51] This distinction is of potential importance because stable governments, military *or* civilian, are more likely to have the capacity to institute policies effectively than are less stable governments.[52] In terms of the arguments considered in this paper, this implies that the duration of military rule may affect social change when the military regimes involved are fairly stable. If on the other hand, they are relatively unstable, it implies that military regimes would have no noticeable effects on social change.

To determine whether variations in the continuity of military regimes systematically affect the estimates reported in the last two tables, those analyses were repeated excluding countries that experienced more than one *coup d'état* during the period under investigation (the fifteen countries involved here are noted in the Appendix). Many of the remaining 62 countries have experienced sustained periods of military rule, but none experienced a series of discrete military juntas during the decade beginning in 1960. Thus, this sample of 62 countries allows us to examine the effects of the duration of *relatively continuous* military regimes on social change.

Tables 8 and 9 report the parameter estimates for this subset of observations for the period from 1960 to 1970. Again, these estimates are consistent with those reported earlier in Tables 6 and 7. The two apparent exceptions

[50] These estimates are not reported here for reasons of space. Note that the distribution of X (Duration of military rule) is approximately normal for the 36 countries with $X>0$.

[51] This second outcome could indicate either that military governments were continuous but that every 25 months a new junta replaced the existing one through a *coup*, or that each 25-month period of military rule was followed or interrupted by (at least) a brief period of civilian government.

[52] On this point, see among others the discussion of "durability" in Harry Eckstein, *The Evaluation of Political Performance: Problems and Prospects* (Beverly Hills, Calif.: Sage Professional Papers in Comparative Politics, 01-017, Sage Publications, 1971).

Table 8. Effects of Military Intervention in Politics on Three Indicators of Social Change, 1960 to 1970, Within Categories of 1960 Level of Economic Development: Countries With More Than One *Coup* Excluded ($N=62$)

Dependent Variable	Constant	Military Intervention (X)	Medium Development (Z_1)	High Development (Z_2)	XZ_2	XZ_3	R^2
1. Energy consumption growth	6.883* (1.212)	−.018 (.025)	−.495 (1.727)	−1.634 (1.754)	−.018 (.040)	.018 (.037)	.041
2. School enrollment growth[a]	7.114* (.709)	−.031* (.014)	−3.257* (1.011)	−4.827* (1.046)	.017 (.024)	.037 (.022)	.317
3. Physicians per 1,000 population growth	4.435* (1.028)	−.035 (.021)	−2.253 (1.465)	−3.182* (1.488)	.079* (.034)	.067* (.032)	.136
4. Radios per 1,000 population growth[a]	15.678* (2.237)	.040 (.045)	−9.846* (3.186)	−12.296* (3.299)	−.026 (.074)	−.016 (.069)	.325

The data and their sources are described in the text of this paper. Main table entries are the parameter estimates, and numbers below them in parentheses are their standard errors. Starred (*) estimates are more than twice their standard errors.

[a] School enrollment and radios per 1,000 population data for Taiwan are missing, so the estimates for these dependent variables are based on an N of 61.

Table 9. Effects of Military Intervention in Politics on Three Indicators of Social Change, 1960 to 1970, Within Regions: Countries With More Than One *Coup* Excluded ($N=62$)

Dependent Variable	Constant	Military Intervention (X)	Latin America (Z_2)	Asia (Z_3)	Africa (Z_4)	XZ_2	XZ_3	XZ_4	R^2
1. Energy consumption growth	6.635*	−.050	−2.579	−1.434	2.088	.054	.061	−.028	.160
	(1.490)	(.038)	(1.961)	(2.196)	(1.932)	(.048)	(.045)	(.056)	
2. School enrollment growth[a]	3.891*	−.005	−2.264	1.079	3.104*	.018	−.018	−.009	.391
	(.881)	(.022)	(1.159)	(1.346)	(1.142)	(.029)	(.027)	(.033)	
3. Physicians per 1,000 population growth	1.866	−.009	.757	−.702	2.366	.040	.028	−.018	.086
	(1.389)	(.035)	(1.828)	(2.047)	(1.801)	(.045)	(.042)	(.052)	
4. Radios per 1,000 population growth[a]	3.793	.009	.732	11.266*	7.287	−.061	.016	.166	.372
	(2.835)	(.072)	(3.732)	(4.335)	(3.677)	(.092)	(.086)	(.106)	

The data and their resources are described in the text of this paper. Main table entries are the parameter estimates, and numbers below them in parentheses are their standard errors. Starred (*) estimates are more than twice their standard errors.

[a] School enrollment and radios per 1,000 population data for Taiwan are missing, so the estimates for these dependent variables are based on an N of 61.

are the estimates for β in the equation for school enrollment growth rates and for the δ_i in the equation for growth in the physician-to-population ratio in Table 8. Like the corresponding estimates in Table 6, however, these are not robust and present no substantial challenge to the basic conclusion.[53] The analyses presented in Tables 8 and 9 thus indicate that the presence in the analysis of countries that had experienced more than one *coup* during the decade does not systematically affect the results reported earlier. In short, military intervention in the politics of the Third World has no unique effects on social change, regardless of either the level of economic development or geographic region.

Discussion

In this paper I have attempted to assess the empirical validity of three contrasting views of the effects of military governments on social change in countries of the Third World. The first and more optimistic of these views suggests that such regimes are typically progressive forces promoting social change, while the second view more pessimistically sees military governments as conservative or even reactionary forces that actively inhibit social change. The third perspective comes from Huntington and seeks to integrate the first two by hypothesizing that the effects of military governments on social change vary by the level of economic development: in poor countries, these governments tend to be reformist and progressive, while in more wealthy countries they become conservative (if not reactionary) movements seeking to protect the privileges of entrenched social groups.

The empirical analysis just presented lends no support to any of these viewpoints. Instead, both the reexamination of the Adelman and Morris data and the analysis of more recent data indicate that military governments have no unique effects on social change, regardless of level of economic development. This conclusion clearly contradicts the earlier analysis by Nordlinger, but the difference is readily explained in methodological terms. More interestingly, the present analysis is consistent with the results reported by Schmitter and Weaver for Latin America.[54] They, however, were not able to address the Huntington hypothesis fully, given their focus solely on Latin American countries, which are relatively wealthy when compared to other countries of the Third World. The present analysis extends the con-

[53] A modified model for school enrollment growth rates of the form discussed above in the text and in footnote 46 (with the δ_i set to zero) produced an estimate of β that was considerably less than twice its standard error. Similarly, a modified model for physicians to population growth rates with β constrained to a value of zero produced insignificant estimates for both of the δ_i. Note also that an application of the checks for heteroskedasticity discussed above indicates again that none of these conclusions is due to biased standard errors of estimate.

[54] Schmitter, "Military Intervention and Public Policy," *passim;* and Weaver, "Assessing the Impact of Military Rule," *passim.*

clusion reached by Schmitter and Weaver, and indicates that the pattern they find for Latin America holds more generally.

We can conclude that blanket statements portraying military governments in the Third World as either progressive or reactionary are without empirical foundation. This implies that many observers may have been mistaken in attributing unique political skills to the military, whether directed toward progressive or conservative ends. We can also conclude that military regimes do not assume different mantles as countries of the Third World become wealthier. In short, the simple civilian-military government distinction appears to be of little use in the explanation of social change.

Appendix: Country Values for Duration of Military Rule (in Months), December 31, 1960 to December 31, 1970 ($N = 77$)

Africa		Liberia	0
Burundi	54	Mali	25
Cameroon	0	Mauritania	0

* These countries (of which there are fifteen) experienced more than one military *coup d'état* during the period. They are therefore excluded from the analyses reported in Tables 8 and 9 of this paper.

Political Compliance and U.S. Trade Dominance*

NEIL R. RICHARDSON
The University of Texas at Austin

An axiom among students of international politics is that there are vast disparities in the relative abilities of nations to influence each other. It is usually assumed that the roots of superior influence include population size, economic productivity, and military might. What is not fully clear, however, is how or whether such factors operate systematically. Are there patterns to the asymmetrical influence exercised by dominant nations? How is such influence made manifest?

The present study addresses these questions by developing and testing an economic explanation of international political submissiveness in a hierarchical world. Data from the 1960s are used to examine the role of the United States as a dominant nation with influence over a subsystem of dependencies. Both the fact and the extent of influence are assessed using foreign trade-related variables suggested by international trade theory.

A central proposition is that U.S. dependencies should distinguish themselves by displaying greater voting agreement with the U.S. in the United Nations General Assembly than do other countries. The extent to which voting agreement is in fact an objective of the U.S., and hence a meaningful index of its dominance on issues of importance to it is also explored. Finally, a tentative ordering of the potency of each of the economic variables in question is considered.

* This article is adapted from the author's doctoral dissertation, *Trade Dependence and Political Cooperation Among Nations* (Ann Arbor: University of Michigan, 1974). Generous help with the original manuscript was offered by Stuart Bremer, Dorwin Cartwright, A. F. K. Organski, and especially Raymond Tanter who chaired the project. Bruce Buchanan, Helmut Norpoth, Ivan Orton, A. T. J. Vernooy, and two anonymous referees have also provided valuable assistance at different stages. Many of the data were collected and made available by the Inter-University Consortium for Political Research, Ann Arbor, Michigan. Neither the original collectors of the data nor the Consortium bears any responsibility for the analyses or interpretations presented here. Early phases of the study were facilitated by a dissertation grant from the Department of Political Science, The University of Michigan. Preparation of the manuscript for this article was aided by support from the University Research Institute, The University of Texas at Austin. An earlier version was delivered at the 1975 Annual Meeting of the American Political Science Association, San Francisco, September 2-5, 1975.

Theoretical Considerations

The hypotheses considered in later pages are derived from an explanation which assumes that nations exist in a global hierarchy. As suggested, the notion of a hierarchical international system is hardly novel. But systematic explanations of resultant influence relations between powerful and weak nations are relatively scarce.[1]

It is generally agreed, however, that somehow a nation's influence capabilities depend on the amount of resources it has available. One way to conceptualize this connection between a nation's influence potential and its resource base is to view resources as goods and services which can be offered to, or withheld from, a second nation as the first chooses.[2] In this way, the first nation can influence the second by affecting the latter's benefits, costs, and probability of success.

This perspective on influence capabilities can usefully be adapted to a hierarchical analysis based on international trade theory.[3] To do so requires, as a first step, an understanding that trade between nations is beneficial to each participant. The benefits, in turn, result from differences in endowments of land, labor, and capital which best suit countries to the manufacture of different products, to attendant economies of scale provided by larger markets, and the like.

[1] Recent volumes exploring this general perspective include Steven L. Spiegel, *Dominance and Diversity: The International Hierarchy* (Boston: Little, Brown, 1972), and Marshall R. Singer, *Weak States in a World of Powers: The Dynamics of International Relationships* (New York: The Free Press, 1972).

[2] This explication of the assumed relationship between rank and influence paraphrases *Group Dynamics: Research and Theory*, ed. Dorwin Cartwright and Alvin Zander, 3rd ed. (New York: Harper & Row, 1968), p. 220.

The application of this idea to asymmetrical politics is exemplified by Edgar Litt and Michael Parenti, *Democracy's Ordeal in America: A Guide to Political Theory and Action* (Hinsdale, Ill.: Dryden Press, 1973), pp. 30–33.

[3] The reader is referred elsewhere for a full exposition of the fundamental trade theory employed here. See, for example, Charles P. Kindleberger, *International Economics*, rev. ed. (Homewood, Ill.: Richard D. Irwin, 1958), chapters 5 and 6, or Paul T. Ellsworth, *The International Economy*, rev. ed. (New York: Macmillan, 1958), chapters 4 through 7.

But in a hierarchical world, an international system composed of national economies of widely differing sizes, the rudiments of trade theory bear implications beyond a mere "division of labor" characterization.

Thus, consider international trade transactions between unequals, the first being the United States and the second a small economy. In a hypothetical case where each annually sells 200 million dollars worth of goods to the other, the consequences are different for the two; the market value of the commodities is symmetrical but the effects of the exchange are not. The benefits to the second nation are greater because a proportionately greater share of its domestic consumption now occurs at reduced, import prices. Meanwhile, and more important in the present context, a proportionately greater share of its total economic activity depends on a foreign market for its exports. In sum, as a result of this transaction, the second nation becomes more *export dependent* than is the United States because the latter has the capacity to manipulate more benefits and costs (for example, via interruption of trade) than does the former.

The political ramifications of such economic interactions are not difficult to apprehend. Because the larger economy dominates the smaller one through their mutual trade, the latter will be constrained to exhibit "cooperative" behavior born of economic dependence; it should behave deferentially. Borrowing a term used by social psychologists, I shall hereafter refer to such political behavior on the part of economic dependencies as "compliance."[4]

The following proposition summarizes this form of political behavior: Nations that engage in substantial trade with a dominant partner should display compliant political behavior toward it. In more abstract language, the preceding exposition describes a hierarchical international system in which nations are differentially constrained according to their rank.

It should be added that the argument presented to this point is consistent with prior empirical investigations. For example, Karl Deutsch and Alexander Eckstein have demonstrated that large (industrial) national economies clearly tend to rely on foreign trade as a constituent part of their total economic activity to a lesser degree than do small (nonindustrial) countries.[5] And Bela Balassa confirms that the great majority of exports from small, underdeveloped economies are sold in industrialized markets.[6] In combination, these two observations lend additional credence to the present economic characterization. Nonindustrial, that is, economically small nations are relatively heavily dependent upon foreign trade, and the buyers of their exports are chiefly those economic giants whose own resources are so great as to put them in a dominant position in the partnership.[7] Finally, trade flows for the United States accord with this global configuration. Whereas, for 1965, U.S. foreign trade made up only 7.3 per cent of its gross national product (GNP), Costa Rican trade with the U.S. *alone* accounted for some 19 per cent of that small economy's GNP.[8]

To this juncture, the political compliance of dependencies has been described as only a manifestation of export dependence. Trade theory prompts the inclusion of three supplemental factors: commodity concentration, recipient concentration, and economic development.

A common conception regarding international trade has it that small, nonindustrial economies have few commodities to sell on the world market owing to their narrow bases of production. Whether or not this is an accurate description of those countries in particular, there is theoretical reason to believe that undiversified export activity is a source of vulnerability for any nation. The logic is simple. A downward shift in price or demand for any single export commodity is to some extent damaging to any economy. The smaller the number of different exports a country has, the greater is its loss should any one product suffer market misfortunes. Thus, commodity concentration in exports should be particularly worrisome to

[4] See Herbert C. Kelman, "Compliance, Identification, and Internalization: Three Processes of Attitude Change," *Journal of Conflict Resolution*, 2 (March 1958), 51–60. Kelman's compliance and conformity as overt behavior styles correspond to the expectations here. But they do not require "internalization," behavior motivated by the intrinsic rewards of the acts for the actor. Also see Cartwright and Zander, p. 230.

[6] Bela A. Balassa, *Trade Prospects for Developing Countries* (Homewood, Ill.: Richard D. Irwin, 1964), p. 12, where the U.S., Canada, non-Communist Europe and Yugoslavia, Japan, Australia, New Zealand, and South Africa are classified "developed."

[7] This same configuration is explored by Johan Galtung, "A Structural Theory of Imperialism," *Journal of Peace Research*, 8, No. 2 (1971), 81–117; Francois Perroux, *L'économie du XX^e siècle* (Paris: Presses Universitaires de Frances, 1961), pp. 27–56.

[8] Data are from the United Nations, Statistical Office, *Yearbook of International Trade Statistics*, 1965 (New York: United Nations, 1967).

a country highly dependent on its overseas markets.[9]

Another economic factor is recipient concentration, where "recipients" are countries other than the principal partner that buy exports from the nation in question. The point here again is that a lack of diversity is a liability for the exporter, in this case because recipients other than the dominant partner represent alternative markets which may be available should the dominant outlet be closed off. A small number of alternative markets reduces the exporter's immediately available buyers of goods no longer sold to the dominant country. Thus, the greater the concentration of (alternative) recipients, the greater should be a dependency's political compliance as insurance against loss of its largest market.[10]

Finally, theoretical discussions suggest that lack of economic development itself heightens dependency.[11] As suggested earlier, underdeveloped economies gain proportionately more from a given amount of trade than do their industrialized partners. In addition, insofar as such trade is thought to be a means to generate needed capital for development, their perceived stake in foreign commerce is further augmented.[12] Accordingly, any decrease in trade would thereby entail particularly high costs. Lack of economic development, then, is a further liability itself, exacerbating export dependence, and it should be manifested in increased political compliance with the dominant trade partner.

Now how do these factors relate to each other? The preceding paragraphs offer some clues that permit the analysis to advance an additional step. That is, a brief reconsideration of the four economic concepts — export dependence, commodity concentration, recipient concentration, and economic development — provides some basis for speculation as to their respective potencies in producing political compliance.

Taking commodity concentration and recipient concentration first, the former is likely to be more worrisome for the dependency. The reason for this is not difficult to grasp. The dependency that heavily relies on a single export product may suffer a disastrous price or demand decrease for that good at the hands of its dominant buyer. On the other hand, even a dependency with just a few other major buyers will continue to have some available markets for its exports should it lose its largest outlet. Thus, recipient concentration would appear to be a less threatening circumstance than commodity concentration.

Recipient concentration should also be less consequential in producing compliance than is export dependence. The reason for this expectation is that dependent status is an immediate fact of the dependency's existence, whereas the perils of recipient concentration deal with the availability of future, prospective markets if the country's trade circumstances should suddenly worsen.

Moreover, economic development is likewise probably more relevant than is recipient concentration to a dependency's political behavior. This is a defensible ordering because little economic development represents a systemic weakness in the dependency's economy. By comparison, a concentration of alternative export markets represents, after all, a potential hazard only in the economy's foreign trade sector (at least initially).

Thus, with recipient concentration as the fourth most important factor, attention can now be turned to the other three. Consider next commodity concentration and export dependence. An economy that produces a very narrow range of export goods yet relies on overseas markets for a limited share of its total economic activity is ultimately vulnerable only to the extent that it relies on that trade. But another dependency in opposite circumstances — low concentration and high export dependence — while not jeopardized in any one line of goods, can be devastated by unfavorable sanctions visited upon it by its dominant trade partner. Therefore, commodity concentration can be ranked behind export dependence.

In addition, economic development should

[9] Also note that nonindustrial economies often rely heavily upon agricultural exports, those very goods historically susceptible to dramatic price changes. See, for example, Richard N. Cooper, *The Economics of Interdependence: Economic Policy in the Atlantic Community* (New York: McGraw-Hill, 1968), p. 80.

[10] See Peter J. Lloyd, *International Trade Problems of Small Nations* (Durham, N.C.: Duke University Press, 1968), p. 46; Albert O. Hirschman, *National Power and the Structure of Foreign Trade* (Berkeley: University of California Press, 1945), pp. 30, 85–86; Singer, *Weak States*, pp. 239, 222–223.

[11] David Vital, for example, asserts that economic dependence stems from several factors, including level of economic development, as well as the impact of foreign trade on the economy: " . . . the actual dependence of a given small power on foreign economic factors . . . will depend on the volume of foreign trade relative to total economic activity, on the rate and *level of economic development*, on the chosen fields of specialization, on the variety of the nation's domestic resources and the skill with which they are utilized . . . ." In *The Inequality of States* (London: Oxford University Press, 1967), p. 55 (emphasis added).

[12] *Ibid.*, p. 47; Lloyd, pp. 21-22.

also be ranked in importance ahead of commodity concentration. Parallel to the argument regarding recipient concentration, commodity diversification only bears on the external share of a country's total economic activity, whereas economic development is crucial to the entirety of a country's resilience in times of duress. Commodity concentration, then, is probably third most important among the economic factors.

Speculation regarding the potencies of export dependence and economic development is, happily, facilitated by the above discussion. Again, economic development represents vitality in the entire national system, and export dependence is a vulnerability particular to just some portion of it. That is, even an extremely export-dependent country may be able to recover from a damaging blow to its foreign market if the economy is sufficiently developed to engage in compensatory domestic expansion or to nurture new overseas buyers. On the other hand, an economy only marginally dependent on exports to a dominant partner would suffer greater costs if that principal market were lost. Therefore, it seems reasonable to suspect that low economic development would induce a dependency's compliance more forcefully than would the *extent* of the dependence itself.

The transitive ordering of these factors is, then, in order of decreasing importance to compliance, (1) economic development, (2) export dependence, (3) commodity concentration, and (4) recipient concentration. But more must be said of the compliance expected to result from these constructs.

Political Compliance

In returning to the expectation that U.S. export dependencies should be politically compliant, one must consider the outward signs of such submissiveness. Governments have a variety of means by which to bestow political favors, including amicable and frequent diplomatic discourse, public and private diplomatic support on matters regarding third states, intervention to facilitate relations between private parties, and so on. But the publicity and frequency of such occasions varies so greatly among countries in the contemporary world that they are difficult to specify in a systematic and comprehensive fashion.

On the other hand, votes in some international organizations are regular and public statements of the member governments through their delegates.[13] Additionally, the United Nations General Assembly has been singled out as appropriate to this study owing to its almost universal membership.

Moreover, it is also asserted that General Assembly roll calls reveal patterns of voting alignments of particular interest to the present investigation.[14] Inis Claude says that "the major states have at least as much influence within and upon [the Assembly] as they are entitled to. by virtue of their size, strength, and general importance."[15] Robert Keohane identifies economic dependence as an important motive for roll call agreement: "The more dependent a state is on a great power for trade, aid, or protection, the more responsive it is likely to be to pressure" in the General Assembly.[16]

The Assembly annually votes on a wide range of substantive issues. Among the many resolutions subject to roll call procedures, some of them are doubtless of greater interest to the U.S. government than others are. Accordingly, it would seem likely that the U.S. would attempt to elicit its dependencies' compliance on votes most salient to it. Thus, the essence of this discussion suggests that the dependencies should display greater compliance when the outcome is more important to the U.S.

There is abundant reason to believe that the United States has ascribed great importance to its cold war relationship with the Soviet Union.[17] Even after the onset of détente in the

---

[13] This paraphrases David Truman, *The Congressional Party* (New York: Wiley, 1959), p. 13, as quoted in Hayward R. Alker, Jr. and Bruce M. Russett, *World Politics in the General Assembly* (New Haven: Yale University Press, 1965), p. 23. Also see Thomas Hovet, Jr., *Bloc Politics in the United Nations* (Cambridge: Harvard University Press, 1960), p. 113.

[14] Hovet, p. 14.

[15] *The Changing United Nations* (New York: Random House, 1967), p. 53. The same thesis is documented in case studies by John G. Stoessinger, *The United Nations and the Superpowers* (New York: Random House, 1965).

[16] Robert O. Keohane, "Political Influence in the General Assembly," *International Conciliation*, No. 557 (March 1966), p. 19. Empirical support for this proposition includes Eugene R. Wittkopf, "Foreign Aid and United Nations Votes: A Comparative Study," *American Political Science Review*, 67 (September 1973), 868–888; Marshall R. Singer and Barton Sensenig III, "Elections Within the United Nations: An Experimental Study Utilizing Statistical Analysis," *International Organization*, 17 (Autumn 1963), 901–925. Wittkopf found some positive connection between U.S. foreign aid allocation and its recipients' Assembly and committee agreement with the donor in 1963 and 1966. Singer and Sensenig, accounting for nations' economic, military, perceptual, and communications ties with the superpowers, discovered these bonds to be associated with voting agreement on cold war questions from 1946 to 1959, though more so for interdependencies than for dependencies.

[17] Alker and Russett, *World Politics in the General Assembly*, chap. 10, present interesting evidence on

mid-1960s, the continuing superpower arms race bears witness to the salience of their antagonisms and mutual suspicions. In sum, U.S. dependencies should exhibit greater compliance on cold war votes than on others.

Derived Hypotheses

The preceding theoretical exposition provides a basis for the hypotheses of this study. The first hypothesis is a broad one, reflecting the primary thrust of the investigation. It distinguishes between dependencies and other countries on the presumption that the economic circumstances of the former will motivate them to display compliant political behavior.

H.1 A nation that is export dependent upon the United States will exhibit greater General Assembly voting agreement with it than will others that are not dependent.

The next hypothesis accounts for the distinction between those political issues more or less salient to the United States.

H.2 A dependency will exhibit greater compliance toward the United States on cold war issues than on other matters.

The third hypothesis captures the transitive ordering of the four economic factors for dependencies.

H.3 A dependency of the United States will display voting agreement with it in accordance with the following factors, listed in order of decreasing importance: (1) declining economic development; (2) increasing export dependence; (3) increasing commodity concentration; (4) increasing recipient concentration.

Operationalizing the Concepts

The concepts now identifiable as essential to this study are (1) export dependence, (2) commodity concentration, (3) recipient concentration, (4) economic development, (5) political compliance, and (6) issue salience. The following paragraphs indicate how they are operationalized for the empirical results which follow thereafter.

Export dependence upon a dominant nation must actually tap two ingredients. First, a nation can only be export dependent if foreign sales are important to that nation's economic health.[18] Additionally, of course, dependency status also requires that the country sell a large share of its exports to the dominant one. Both ingredients thus require relative measures, and each is necessary for a nation to be export dependent.[19]

Accordingly, two simple ratios have been constructed for each considered country. The first ratio is

$$a_i/GNP_i,$$

where a_i is the value of total exports of any country i and GNP_i is that same country's gross national product.[20] The second ratio is

$$a_{i,}/a_i,$$

where a_i represents the value of country i's

nations' issue "intensities" in the General Assembly. Tabulating the numbers of speeches made in that body by different nations, they conclude that by 1961 (the last session they examined), the United States and the Soviet Union had become increasingly intense regarding their "East-West" confrontations, of which cold war issues were a major component.

[18] A similar argument is expressed in Bruce M. Russett's theoretical discussion of economic interdependence; see his *International Regions and the International System: A Study in Political Ecology* (Chicago: Rand McNally, 1966), chap. 8, especially p. 124.

[19] A well-known measure, "relative acceptance" *(RA)*, was developed by Richard I. Savage and Karl W. Deutsch, "A Statistical Model of the Gross Analysis of Transaction Flows," *Econometrica*, 28 (July 1960), 551–572. Measures which divide trade by a nation's gross national product have been used by Russett, *International Regions*, and by Singer, *Weak States*. Cal Clark and Susan Welch have come to the conclusion that investigations such as the present one should more appropriately use a trade/*GNP* measure than one resembling *RA*. See their "Western European Trade as a Measure of Integration: Untangling the Interpretations," *Journal of Conflict Resolution*, 16 (September 1972), 353–382, especially p. 337. Marshall Singer, *Weak States*, combines these two indicators in the same multiplicative fashion used here to measure export dependence, although his ratios are based upon total trade and gross domestic product. The bases for the present choices appear in the following footnote. Singer's formula is presented in his pp. 237–240. Curiously, however, as Singer attempts to establish a threshold value to distinguish "dependent" nations from others, he first argues (p. 238) that an index value of 0.067 is a reasonable partition. But then he less explicitly makes a contrary case (p. 239): " . . . any state that derives even 10 per cent of its Gross Domestic Product from trade with one country is *tied* to that Power" (emphasis added). The ambiguity may revolve around whether he equates "dependent" and "tied."

[20] The decision to use export figures rather than "trade" (roughly exports plus imports) is based on four considerations: (1) Degree of commodity concentrations in export trade is much less than in import trade, thus maximizing variance in the "active" variable, as indicated by Lloyd, p. 14. (For a lucid discussion of systematic, extraneous, and error variance problems in research design, see Fred N. Kerlinger, *Foundations of Behavioral Research*, 2nd ed. [New York: Holt, Rinehart and Winston, 1973] chap. 17.) (2) Exports appear to be more insulated than imports from economic aid, particularly for the values of underdeveloped nations, thereby minimizing systematic extraneous variance, as indicated by Deutsch and Eckstein, "National Industrialization," p. 274, Singer,

exports to country j. The two ratios can then be multiplied to generate

$$ED_{ij} = a_{ij}/GNP_i,$$

where ED_{ij} is an export dependence score for country i on country j.

The concept of *commodity concentration* is relatively straightforward. The indicator must identify the extent to which shares of total exports are distributed across a range of commodity classes. In other words, the need again is for a measure of relative distributions of values.

A concentration index developed by James Ray and J. David Singer has been chosen from among several measures of concentration (or inequality) available.[21] It is represented by the following formula:

$$CON = \sqrt{\frac{(S_i)^2 - (1/N)}{1 - (1/N)}},$$

where S_i is the percentage share of goods for each unit i (commodity class) and N is the number of units considered. One advantage of this index, when compared to others, is that it does not tend to overvalue the preponderance of the larger shares of an uneven distribution among classes.

A second characteristic of *CON* makes it an appropriate index for *recipient concentration*, as well. Its full range of possible values, 0.00 to 1.00, does not change as the number of units varies. This is an especially important attribute in view of the wide variation in numbers of recipients (units) among the included countries.

Economic development is frequently measured by gross national product per capita (*GNP*/capita). This measure provides no information regarding the domestic distribution of wealth, but it does offer an approximation of the amount of capital available for investment and industrial growth. Now "real" income per capita is a more meaningful measure of individual and collective economic status. But, unfortunately, the reliability of the relevant data is "almost inversely proportional" to their validity.[22] Accordingly, *GNP* per capita is used in this study, logarithmically transformed to approximate a normal distribution.

Regardless of its causes, *political compliance* or cooperation, as the case may be, might be expected to vary substantially. The questions treated here again demand a measure which captures the extent of expected behavior relative to the unexpected. Using Arend Lijphart's Index of Agreement *(IA)*, the accord among General Assembly roll call positions for a pair of nations over a series of votes can be summarized.[23] Lijphart's index is

$$IA = [f + (1/2g)]/t,$$

where

- f = number of votes on which the pair agrees (Yes-Yes, Abstain-Abstain, No-No)
- g = number of votes on which the pair partially agrees (Yes-Abstain, No-Abstain)
- t = total number of votes on which the pair voted.

An important assumption of this index is that abstentions represent a position midway between Yes and No. Lijphart argues that this coding rule is particularly appropriate in the General Assembly setting where nations may wish to vote "against" resolutions without offending its supporters by casting a No vote.[24]

Finally, in the context of this study, *issue salience* refers to the greater weight attached by the U.S. to cold war voting support than it imputes to other roll calls. Thus, the roll calls must be partitioned into two categories, "Cold War" and "Others."

The rule that governs the coding of each roll call into one of these two groups is simple. On

Weak States, pp. 248 and 256, and Masakatsu Sato, "A Model of U.S. Foreign Aid Allocation: An Application of a Rational Decision-Making Scheme," in *Approaches to Measurement in International Relations: A Non-Evangelical Survey*, ed. John E. Mueller (New York: Appleton-Century-Crofts, 1969), pp. 198–215. (3) Import values usually include the costs of transport and insurance, export values avoid the introduction of this sort of systematic extraneous variance; (4) Nations with relatively small shares of *all* international trade by virtue of their low resource and industrial base are also, by and large, nations whose exports are most commodity concentrated, according to Michael Michaely, "Concentration of Exports and Imports: An International Comparison," *Economic Journal* 68 (December 1958), 727.

[21] See James Lee Ray and J. David Singer, "Measuring the Concentration of Power in the International System," *Sociological Methods & Research*, 1 (May 1973), 403–437.

[22] Arthur S. Banks and Robert B. Textor, *A Cross-Polity Survey* (Cambridge: M.I.T. Press, 1963), p. 63.

[23] Arend Lijphart, "The Analysis of Bloc Voting in the General Assembly," *American Political Science Review*, 62 (December 1963), 902–917. Absences, as opposed to abstentions, are not coded in these data. As John E. Mueller puts it, an absent delegate is usually not present "for reasons which are best attributed to apathy or disinterest." *Approaches to Measurement*, p. 139. Similarly, those delegates present but not voting are not included, since inferring their positions would be a dubious enterprise in terms of validity or reliability.

[24] Lijphart, p. 910.

those items where the United States and the Soviet Union take positions in complete disagreement, the roll calls are designated "Cold War" ($n = 15$).[25] "Others" is the residual category for votes in which the bloc leaders are in agreement, partial agreement, or else where the Soviet Union did not vote and the United States did ($n = 9$). (If the U.S. did not vote, the roll call is discarded as of no use in computing *IA*'s with the U.S. as half of each pair.)

Data Sources

These operations call for data drawn from several sources. To develop the Export Dependence index, the design requires the coding of (1) the value of total exports by country, (2) the value of total exports to the United States by country, and (3) *GNP* for each country. The source for coding total exports values is the 1965 United Nations *Yearbook of International Trade Statistics*.[26] Exports to the United States are taken from the same source. *GNP* figures for the same year are from Charles Taylor and Michael Hudson, *World Handbook of Political and Social Indicators*,[27] as is *GNP* per capita, the latter to measure economic development.

To measure commodity concentrations by the *CON* index requires only two kinds of data: (1) the number of commodity classes considered; (2) each country's distribution of export percentage shares across those classes. The *Yearbook of International Trade Statistics* provides a tenfold scheme standardized for goods in trade according to the revised Standard International Trade Classification, a taxonomy followed here.

The index values for recipient concentration are based on (1) the number of recipients for each country's exports and (2) the percentage shares of each country's exports to each of its recipients, the United States excluded. (Recall that the U.S. is excluded because the search is for other partners as alternatives to the dominant market.) These data are also based on 1965 values from the U.N. *Yearbook*.

Finally, data for the Index of Agreement, tapping political compliance and cooperation, are drawn from the U.N. General Assembly Plenary Session roll calls for 1965.[28] From these Assembly records three types of information are drawn to meaure agreement: (1) the total number of roll calls in which both countries voted, for each pair; (2) the number of votes with ballot agreement; (3) the number of votes with partial agreement. In addition, to increase the validity of this data set, unanimous and near-unanimous roll calls (90 per cent agreement or more) are excluded because they provide little or no discriminatory information. The same decision also applies to votes specific to each paragraph of a resolution that is so dismembered for separate roll calls, and for the reason that they are nearly always redundancies which would introduce unwanted inflations of agreement or disagreement.[29]

Table 1 summarizes the indicators, measures, and data sources employed. Deleting those countries for which data were unavailable on at least one variable, there remain 103 countries with complete files used in the empirical analyses that follow.

Results

Before any statistical analyses relevant to the hypotheses can be discussed, the identity of the U.S. dependencies, from among the 103 countries, must be established. Here the task is to distinguish a subsystem on the basis of a reasonable criterion. Since dependencies have earlier been described in terms of the extent of their trade ties to the dominant U.S., the export dependence measure is an obvious choice.[30] Not so obvious, however, is the threshold value separating them from other countries.

[25] Alternative means of operationalizing "Cold War" voting are possible, of course. Analogous to Alker's and Russett's technique *(World Politics)*, a factor analysis of roll calls could be used to identify those in which the United States and other "western" nations vote in opposition to the Soviet Union and other "eastern" delegations. A second alternative, however, is employed by Robert J. Mokken and Frans N. Stockman, "A Theory and Method of Roll Call Analysis," paper delivered to the Eighth World Congress of the International Political Science Association, Munich, 1970 (second mimeo, December 1971). Mokken and Stockman (p. 2-2) operationalized "East-West confrontation" " . . . by taking those issues (key votes) in which the U.S.A. and at least nine other NATO countries oppose the U.S.S.R. and at least five other Warsawpact countries." (Cited and quoted with the authors' permission.)

Marshall Singer has suggested a 10 per cent cutoff for his trade/*GNP* ratio which, in turn, suggests a 5 per cent value here where only exports appear in the numerator.[31] Admittedly, the threshold has no particular theoretical origin, but it does satisfy an empirical criterion reflecting the presence or absence of alternate dominant trade partners. Of the 21 countries with ratios of 5 per cent or more on the *ED* index, only three (Nicaragua, Saudi Arabia, and Gabon) are more closely trade-tied to a nation other than the United States.[32] Compare this ratio (18:21) to the next eleven nations with 3 or 4 per cent scores, falling just below the partition. Of this second group, only four export more to the U.S. than to some other partner (4:11). A list of the 21 countries designated as dependencies follows, ordered by the extent of their dependence on exports to the U.S., where higher scores indicate greater dependence.

Table 2

Dependencies of the United States, Ordered by Export Dependence (ED)

Country	*ED* Value
Colombia	.05
Guatemala	.05
Peru	.05
Ecuador	.06
El Salvador	.06
Ethiopia	.06
Haiti	.06
Nicaragua	.06
Uganda	.06
Panama	.07
Philippines	.07
Saudi Arabia	.07
Bolivia	.09
Canada	.09
Jamaica	.09
Costa Rica	.10
Dominican Republic	.10
Gabon	.14
Venezuela	.14
Trinidad and Tobago	.20
Liberia	.23

A glance at the list immediately reveals the "westernness" of the subsystem; the members are not randomly dispersed geographically. Instead, fifteen of the twenty-one are about equally distributed among Caribbean, Central and South American locations.[33] This characteristic of the group is consistent with Hans Linne-

[31] Singer, *Weak States*, pp. 238–239. Also see note 19, above, regarding Singer's apparent indecision on this threshold level.

[32] Nicaragua and Saudi Arabia are, by this measure, much more dependent on Japan than on the United States. Gabon is much more dependent on exports to its former metropole, France.

[33] Russett, *International Regions*, pp. 133–143, finds that twelve of these fifteen Western Hemisphere dependencies were "interdependent" traders in his two clusters of American countries. His overlap with this study is reduced owing to his search for *reciprocal* trade ties.

mann's discovery that geographical proximity is a valuable predictor of relative trade flows.[34]

With the dependencies now identified, the study hypotheses can be tested empirically. The first hypothesis, predicting that the dependencies would be in closer agreement to U.S. positions than would other countries, statistically states that differences in agreement among members of each group will be smaller than differences between the groups, with dependencies scoring higher. Analysis of variance shows that the two groups of nations do not differ appreciably on "Other" votes ($p > .77$). The picture is markedly different, however, on "Cold War" issues. Here the dependencies clearly agree with the U.S. significantly more than do the nondependent countries ($p = .0001$). Group agreement averages appear in Table 3.

Table 3

Agreement Averages by Group and Issue

	Dependencies	Nondependencies
Cold War ($n = 15$)	.598	.410
Other ($n = 9$)	.883	.855

Of course, this same evidence also bears upon the second hypothesis, predicting that dependencies will be more compliant on Cold War roll calls. Comparing dependencies' averages on the two issue categories (Cold War vs. Others), the hypothesis fails the empirical test in that their agreement on Cold War votes is lower rather than higher. That finding, however, is considerably mitigated by the fact that the remaining 82 countries tend to depart from the U.S. on Cold War votes significantly more than do dependencies. That is, although its dependencies agree with the U.S. less on Cold War roll calls than on Others, there is evidence that they are compliant when the superpowers are in full disagreement.

To clarify the matter, consider the plausibility of the following rationale. First, it should be noted that if the U.S. attaches greater utilities to Cold War issues than to Others, that does not imply that governments will therefore necessarily tend to agree with it more on Cold War votes. Instead, the proposition only implies that the U.S. will more often employ whatever resources it commands, including economic incentives accompanying its foreign trade relations, in efforts to muster Assembly support on those roll calls most salient to it. Thus, the fact that levels of agreement with the U.S. are lower on Cold War votes may mean that nations, dependent and otherwise, are less inclined to vote against the Soviet position despite U.S. efforts to the contrary. And the observation that dependencies are measurably more agreeable than nondependencies on Cold War votes supports this interpretation. Notice, however, that U.S. dependencies by this account are subject along with other countries to some unspecified influence by the Soviet Union, as well as by the United States.[35]

The third hypothesis, predicting a transitive ordering of the respective impacts of the economic variables upon compliance, is scrutinized by means of linear multiple regressions.[36] These results appear in Table 4.

Table 4

Partial Associations for Dependencies[a]

	Issue Category	
	Cold War ($n = 15$)	Other ($n = 9$)
(log) Economic Development	.44 (.00)	.14 (.00)
Export Dependence	−.31 (.00)	−.23 (.00)
Commodity Concentration	.47 (.52)	.04 (.09)
Recipient Concentration	.02 (.56)	−.29 (.10)

[a] Values are beta weights; those in parentheses are standard errors.

Several facts emerge here. First, it should be noted that the independent, economic variables are plagued by random error while the roll call tabulations of the dependent variables are nearly error free. This distribution of random error leads to somewhat understated partial coefficients, particularly for the dependence and development factors where the errors are probably greatest. The same unreliability also exaggerates the standard errors of the associations.

Second, notice that the partial associations (beta weights) are almost always higher for

[34] *An Econometric Study of International Trade Flows* (Amsterdam: North-Holland Publishing Company, 1966). In his study of foreign trade *inter*dependencies, Russett, *International Regions*, shows the U.S. to be a key member of his "North and Central America" group in 1963.

[35] See Keohane, "Political Influence," p. 23.

[36] Bivariate correlation coefficients among all pairs of the four economic factors are so small that it is safe to interpret the partial associations between each of them and political compliance in a straightforward fashion; there is no significant multicollinearity among them.

Cold War votes than for Other issues, consistent with the second hypothesis. Some of these relationships, however, are themselves unexpected. For example, even though economic development is most strongly related to voting agreement, the *direction* of the association is the inverse of that predicted by the third hypothesis. Thus, dependencies such as Canada and Venezuela, with proportionately high per person productivity, are more prone to agree with the U.S. than are less developed dependencies such as Ethiopia, especially on Cold War roll calls. In theoretical terms, this positive association indicates that relative lack of economic development among the dependencies implies no corresponding heightening of compliance. Instead, the opposite association exists, and for reasons unanticipated by the present dependence theory.

The association of export dependence with voting agreement also assumes an inverse direction from the hypothesized one. Illustrative is a comparison of Liberia and Gabon, with very high dependence scores and Cold War agreement values of only .38 and .35 respectively, as opposed to marginally dependent Peru, El Salvador, and Nicaragua with agreement levels of .79, .79, and .94.

Table 5

Dependence and Cold War Compliance Averages

	Mean ED	Mean Cold War IA
Western Dependencies ($n = 15$)	.08	.66
Nonwestern Dependencies ($n = 6$)	.10	.28

Moreover, if the 21 subsystem members are subdivided into two groups according to whether they are in the western hemisphere, as in Table 5, an instructive comparison can be made. The six nonwestern dependencies average a much lower compliance level on Cold War votes despite a slightly higher dependence score average. The inference to be drawn is that western hemisphere dependence produces markedly more Assembly compliance than does dependence elsewhere in the world. And, to the extent that this tentative conclusion is correct, it is consistent with notions of geographical regions as identifiable subsystemic clusters of nations set apart by their interaction patterns.[37]

[37] One example of the controlling assumption that geographically-defined subsystems are valuable and defensible is Michael Brecher's "The Subordinate State System of Southern Asia," *World Politics*, 15 (January 1963), 213–255.

For both commodity and recipient concentrations the standard errors are sufficiently great so that no real confidence can be placed in their partial associations with voting in either issue category. But it does appear that recipient concentration can fairly be judged to have no effect upon dependencies' compliance, and the effect of commodity concentration is, at best, indeterminate.

Finally, the combined capacity of the four economic variables to account for variance in dependencies' compliance, measured by the squared multiple correlation coefficient (R^2), is .21 for Cold War votes and .18 for Others. In other words, the economic factors have only a modest impact on the voting behavior of the dependencies by this measure even though, as a group, these nations were earlier observed to differ markedly from other Assembly members in agreeing with the U.S. on Cold War issues.

To summarize, then, the dependencies proved to be distinctly compliant on Cold War voting occasions, so that the first hypothesis was apparently borne out in the context of the second. Characterizing the results concerning the third hypothesis is a more difficult task. The two economic factors expected to be of greatest importance *were* of greatest importance, but the signs of their partial regression coefficients were opposite to those hypothesized; the more economically developed dependencies tended to be in greater agreement with the U.S., as did those with relatively low export dependence scores. So what does all of this mean in broader terms? A few points of discussion are in order.

Discussion

This analysis of the behavior of U.S. dependencies in the mid-1960s prompts several points of discussion and speculation about the adequacy of the dependency theory advanced at the outset.

First, it is demonstrably true that the dependencies agreed with the U.S. more on Cold War votes than did the other countries in the study, consistent with the first and second hypotheses. What is not clear, however, is why this happened.

It may be, for example, that the dependencies were compliant because they were frequently reminded by the U.S. that their voting behavior on Cold War matters could affect their trade partnership. On the other hand, David Vital suggests that latent economic pressures are understood by dependencies: " . . . [possible sanctions] need not be put into full effect or even spelled out explicitly in diplomatic contacts for the desired political result to

be produced."[38] The aggregate data analyzed here cannot, of course, resolve the question.

The apparent absence of compliance on Other roll calls also merits some speculation. In keeping with the notion of issue salience, the fact that accord with the U.S. was higher for all nations on Other votes is relevant. This result may reflect the United States' willingness to accede to the wishes of other nations on issues it considered less salient and that they perceived to be important to their interests. If so, then U.S. agreement levels with its dependencies would not be expected to have been especially high on those occasions (Other votes) because it was not vulnerable to economic pressures from them; the economic ties were asymmetrical.

A second empirical result is that the dependency subsystem identified in this investigation was regional in two senses. On the one hand, its membership largely consisted of countries geographically clustered in the western hemisphere. But dependence also emerged as a regional phenomenon since the *western* dependencies exhibited the greatest degree of political compliance, the expected *consequence* of dependence.

Why was this so? Clearly the dependence theory, grounded in elementary international trade principles, is unable to account for the dramatically different compliance levels exhibited by the two subsets of dependencies. Indeed, greater doubt is cast on the appropriateness of the dependency theory by the discovered weakness of the total relationship between the dependency factors and political compliance.

Now, it may be that both of these threats to the theory could be silenced by fortifying the dependence theory, that is, by expanding it to include dependence upon foreign aid, international investment, and monetary relations, as well as upon trade. For example, it may be that western dependencies are more closely tied to the United States than are the other dependencies when several dimensions of economic dominance are considered simultaneously. Moreover, the merging of these economic possibilities might result in a greater statistical value for their combined relationship with compliance in the Assembly.

But attempting to defend an economic approach by suggesting its potential for expansion may seem too facile. Worse, such a strategy could become a barricade to further scientific inquiry if it were carried to extremes. Finally, and without prejudging the roles of unexamined economic influences, it nevertheless seems likely that some noneconomic factors affected the dependencies' voting behavior during the 1960s.

For example, governments of dependencies in the western hemisphere may have been more compliant because they feared the interventionist propensities of the United States, both overt (i.e., militarily) and covert, in "its own backyard." U.S. military ventures in Guatemala, Cuba, and the Dominican Republic had culminated in the "Johnson Doctrine" of 1965, a statement of intent to intervene whenever the U.S. perceived a communist threat in its hemisphere.[39] More recent covert intervention in Chile, officially acknowledged later in Washington, suggests that the "policeman's" active role in the hemisphere has been more frequent than military interventions alone would indicate.

A second noneconomic factor eliciting compliance from western dependencies might have been their fears of Castro's intent to export Communism in the region. In this example, contrary to the Johnson Doctrine notion, the U.S. and its dependencies in the hemisphere would have had a shared motive, a common, external threat perceived by the governments both of the dominant nations and of the more compliant subset of the dominated countries.

This study has not attempted to test such political influences on Assembly voting behavior. But the results presented here do indicate that factors other than the four trade-related determinants were at work. In other words, dependence relations have almost certainly been accompanied by many other types of motives that prompted Assembly delegates to cast their votes with and against the U.S. As Bruce Russett points out, some Assembly votes are based on domestic political considerations. At other times, roll call positions may reflect international, systemic pressures, even vote trading among delegations.[40]

Moreover, the character of global hierarchy is often said to have changed in important ways in the past decade. Accordingly, at least some of the salient motives of voting choice in the 1960s may no longer prevail. The growing scarcities of finite resources have already altered the fortunes of oil exporting countries. Whether

[39] See, for example, Thomas M. Franck and Edward Weisband, *Word Politics: Verbal Strategy Among the Superpowers* (New York: Oxford University Press, 1972), especially chapter 5.

[40] This distinction between domestic and international factors is pursued by Russett, *International Regions*, chaps. 4 and 5.

or not comparable cartels will similarly reverse the economic circumstances of other poor societies, it seems likely that governmental leaders in dependencies will continue to be decreasingly compliant in their international economic and political behavior. (Recent anti-U.S. "majority tyranny" in the General Assembly is particularly suggestive in this regard.) If this is the case, then the ambiguous correspondence between theory and evidence found here can only decline in the absence of more adequate explanations of such international relations.

Nevertheless, a continuing focus on global hierarchies is encouraged by the findings of the research reported here and, more broadly, by the near certainty that international asymmetries will persist in the foreseeable future.

Primates and Political Authority: A Biobehavioral Perspective*

FRED H. WILLHOITE, JR.
Coe College

My central argument: There seem to be good reasons to believe that man's biological nature incorporates strong propensities to establish and sustain dominance-deference hierarchies within his social groupings; that is, the stratification of political authority, power, and influence may be *by nature* intrinsic to human social existence. If this hypothesis is tenable, a presupposition common to both liberal and radical political thought must be critically reconsidered and perhaps drastically revised.

The validity and utility of evolutionary-biological (or biobehavioral) analysis of political behavior are almost certainly not widely assumed, accepted, or even thought about very much, so far, by the great majority of political scientists. Nevertheless, this is a mode of analysis of human behavior that, in a variety of forms, is increasingly utilized by zoologists (especially ethologists, who study animal behavior), psychologists, anthropologists, and even a few sociologists.[1] Furthermore, there has been some writing along these lines by political scientists.[2]

Because numerous explanations and justifications of the basic premises of an evolutionary-biological perspective on human behavior appear in the sources which have been cited so far, I shall not present here any elaborate statement and defense of this approach.[3] Put very briefly, it involves assuming as the fundamental paradigm for the study of all living things (including man) the modern "neo-Darwinian" theory of evolution: species diverge and evolve as a result of the interactions of genetic variability, mutation, genetic recombination, and natural selection for fitness in given environments.[4] Since not merely the physical structure of an animal but also its behavior determines its evolutionary fitness, natural selection shapes the behavioral capabilities and propensities of every species and every individual.[5] Although in the hominid (prehuman and human species) line, generalized learning ability and intelligent adaptability have been strongly selected for, it is legitimate

* I am greatly indebted to Duane M. Rumbaugh, Georgia State University, for inspiring me to plunge into the primate literature, and to R. R. Larsen, Dalhousie University, and Roger D. Masters, Dartmouth College, for reading an earlier draft of this paper. Their criticisms were invaluable, but, of course, I alone should be held responsible for this final version.

Masters, "Genes, Language, and Evolution," *Semiotica*, 2,4 (1970), 295–320; Fred H. Willhoite, Jr., "Ethology and the Tradition of Political Thought," *Journal of Politics*, 33 (August, 1971), 615–641. For a cataloguing of political science articles influenced in a variety of ways by biological considerations, see Albert Somit, "Review Article: Biopolitics," *British Journal of Political Science*, 2 (April, 1972), 209–238.

[3] I would especially recommend to the curious reader, however, two of the most clearly written introductions to biobehavioral thinking: Robin Fox, "The Cultural Animal," in *Man and Beast: Comparative Social Behavior*, ed. J. F. Eisenberg and Wilton S. Dillon (Washington: Smithsonian Institution Press, 1971), pp. 273–296; Bigelow, "The Evolution of Cooperation, Aggression, and Self-Control." A work that may become a basic point of reference for all biobehavioral thinking is Edward O. Wilson, *Sociobiology: The New Synthesis* (Cambridge: Belknap Press of Harvard University Press, 1975).

[4] For lucid explanations of this theory, see Theodosius Dobzhansky, *Mankind Evolving* (New Haven: Yale University Press, 1962); George Gaylord Simpson, *The Meaning of Evolution* (New Haven: Yale University Press, revised ed., 1967), esp. chap. 14, "Forces of Evolution and Their Integration."

[5] For a review and explanation of some of the experimental evidence and basic theory on this point, see Gerald E. McClearn, "Behavioral Genetics: An Overview," *Merrill-Palmer Quarterly of Behavior and Development*, 14 (January, 1968), 9–24.

to infer that we have inherited both cognitive and affective biases which significantly and differentially influence our learning processes.[6] That is, because we are the products of an evolutionary history, we are genetically "programmed" to learn and persist in certain kinds of behaviors much more readily than is the case with other possible behaviors (and probably also, to a limited degree, to respond in stereotyped ways to certain types of stimuli). This does not necessarily mean that a particular behavior is *inevitable*, rather that heredity significantly affects the *probability* of its development.[7]

Setting out from these premises, how might we discover what kinds of evolved behavioral propensities in man may be relevant to comprehending and theorizing about political behavior? This effort invariably requires speculation about the nature of man's evolution, given the paucity, so far, of knowledge of the human behavioral genotype. Speculation can be, of course, more or less well grounded in and consistent with available evidence. The principal types of data used thus far in efforts to reconstruct the course of hominid evolution are studies of the behavior of other animal species (especially subhuman primates), interpretations of prehominid and hominid fossils, and observations of the behavior of contemporary Stone Age peoples. There are major problems in the evolutionary interpretation of each of these categories of data, but new discoveries of considerable significance and suggestiveness are constantly being reported — especially in the areas of primate behavior and hominid fossil-hunting. Reconstructions based on scientifically conscientious speculation seem at least deserving of serious consideration by all students of human behavior.

Relevance of Primate Studies

So far as scientific evidence is concerned, I shall focus primarily upon studies and interpretations of subhuman primate behavior, a field which has developed rapidly only in the past fifteen years. Carefully drawn analogies (and, to some degree, perhaps, homologies)[8] between behavior patterns in monkeys and apes and human behaviors are both legitimate and enlightening. A leading primate behavior theorist and an anthropologist conclude: " . . . to understand human societies, one needs to discover the lineaments of them in subhuman primate societies. This now seems possible."[9]

Monkeys and apes are considered to be of great significance for the study of man primarily because they are our nearest evolutionary relatives. Among the major primate groups, divergences from common ancestors occurred, probably, from about ten to fifty million years ago. Most recently on this time scale predecessors of present-day great apes (chimpanzees, gorillas, orangutans) and of hominids diverged; next most recently, precursors of Old World monkeys (e.g., macaques, baboons) diverged from the primate line that eventually led to man; and long before that time, the New World monkeys (e.g., spider monkeys, squirrel monkeys) had differentiated from the primate line which ultimately produced Old World monkeys, apes, and hominids. An eminent primatologist points out that man shares a considerable degree of genetic potential with apes and monkeys and that anthropoid primates have been very conservative species which have departed little from the ancestral pattern of primate structure. Thus, he concludes, it is quite reasonable to assume that studies of ape and monkey behavior can pro-

[6] Nash, *Developmental Psychology*, pp. 59, 116, 158, 233; David A. Hamburg, "Emotions in the Perspective of Human Evolution," in *Expression of the Emotions in Man*, ed. Peter H. Knapp (New York: International Universities Press, 1963), 300–317; Sherwood L. Washburn and David A. Hamburg, "The Study of Primate Behavior," in *Primate Behavior: Field Studies of Monkeys and Apes*, ed. Irven DeVore (New York: Holt, Rinehart and Winston, 1965), pp. 5–6.

[7] The computer "programming" analogy is developed in effective heuristic fashion in Tiger and Fox, *The Imperial Animal*, chap. 1, "Beginning Biogrammar." For a wealth of clearly explicated experimental evidence for the biobehavioral perspective, see *Biological Boundaries of Learning*, ed. Martin E. P. Seligman and Joanne L. Hager (New York: Appleton-Century-crofts, 1972).

[8] For a helpful attempt to specify the levels of comparison between human behavior and that of other species, see Roger D. Masters, "Functional Approaches to Analogical Comparison Between Species," Paper presented at Conference on the Logic of Inference from Animal to Human Behavior, sponsored by the International Council on the Social Sciences, 1973. Masters distinguishes between a biological "analogy," which refers to common functions served by similar behaviors, and "homology," in which similarities between species stem from a common evolutionary ancestry. (Thus "those characteristics which are more or less common to all primates" might well constitute homologies. [Masters, personal communication.])

[9] Michael R. A. Chance and Clifford J. Jolly, *Social Groups of Monkeys, Apes and Men* (New York: E. P. Dutton & Co., 1970), p. 209. The following are examples of anthropologists' attempts to reconstruct the origins of man and of his species-typical behavioral propensities, largely on the basis of primate studies: Reynolds, "Open Groups in Hominid Evolution"; Robin Fox, "In the Beginning: Aspects of Hominid Behavioural Evolution," *Man*, 2, (September, 1967), 415–433; C. J. Jolly, "The Seed-Eaters: A New Model of Hominid Differentiation Based on a Baboon Analogy," *Man*, 5 (March, 1970), 5–26.

vide indirect evidence for the impact of evolution on man's behavior. Especially is this the case if the species studied lives in an environment similar to that which early man probably inhabited (presumably because in different ecological settings differing phenotypical behaviors will be manifested by separate populations of the same species — if the genotypical behavioral range of a species is relatively broad).[10]

In regard to my central argument, then, what might we learn from primate behavior studies that may help us to comprehend a behavioral pattern ubiquitously noted in human societies — the differential distribution of authority, power, and influence (political stratification)? Essentially, I agree that "political institutions, and particularly high ranking political roles, seem functionally analogous to dominance hierarchies such as those found among many primates."[11] But further, this question must be considered: how likely does it seem that these functional similarities stem, in part, from evolved behavioral propensities common to man and other primate species?

Difficulties and complications immediately arise in attempting to discern the behavioral referents of "dominance" in various studies of primate behavior. (Other terms which are sometimes used, apparently as synonyms of "dominance," are "status hierarchy" and "rank order.") Frequently the direction and outcome of agonistic encounters (threats and attacks) are used as indicators of dominance; in other cases a primary measure is differential access to incentives (e.g., food, estrous females, favored resting places); and sometimes a study focuses on leadership (or "forefronting") of group movement. These — and other proposed measures of rank order — are not invariably intercorrelated in every group of every primate species that has been studied.[12] Despite formidable methodological difficulties and, sometimes, conceptual ambiguity, almost every study of primate social groupings among a wide variety of species has discerned definite rank differentiations among group members. Very frequently these relationships have been more clearly evidenced in deferential and submissive behaviors than in assertive and intrusive activities. This point is emphasized by Hans Kummer, a leading student — both in field and in laboratory settings — of baboon behavior; Kummer asserts that it is the general rule among primate species that younger and weaker individuals defer to older and stronger ones and that males rank higher than females of the same age. Each group member learns its own rank of dominance. Fighting to determine or clarify rank order is relatively infrequent (but can be decisive when it does occur). The dominance order within a group seems to result primarily from some individuals learning — through experience — automatic deference to certain others, with respect to agonistic encounters or access to incentives.[13]

Four Primate Species

Credence may more readily attach to these generalizations if the nature and structure of

[10] John Napier, *The Roots of Mankind* (Washington: Smithsonian Institution Press, 1970), p. 219. An important animal behavior approach that supplements significantly the primatologists' efforts to understand human behavior is the study of predators. Since man evolved as a hunter-gatherer, "human social systems are the product of the selective forces operating on man the primate and man the carnivore . . . " (George B. Schaller and Gordon R. Lowther, "The Relevance of Carnivore Behavior to the Study of Early Hominids," *Southwestern Journal of Anthropology*, 25 [Winter, 1969], 336). Study of hunting species may reveal types of selective forces and convergent patterns of adaptation intrinsic to this way of life — despite the enormous phylogenetic distance between predators and man. Evidence thus far is somewhat equivocal, but there appear to be intraspecies competition and some forms — widely varying — of dominance-submission behavior in lions, hyenas, wild dogs, and wolves. The analogies between wolf pack structure and behavior and human social groups are especially striking. On lions, see George B. Schaller, *The Serengeti Lion: A Study of Predator-Prey Relations* (Chicago: University of Chicago Press, 1972), esp. chap. 5; on hyenas, Hans Kruuk, *The Spotted Hyena: A Study of Predation and Social Behavior* (Chicago: University of Chicago Press, 1972), esp. chap. 6; on wild dogs, Hugo and Jane van Lawick-Goodall, *Innocent Killers* (Boston: Houghton Mifflin, 1971), pp. 49–101; on wolves, Jerome H. Woolpy, "The Social Organization of Wolves," *Natural History*, 77 (May, 1968), 46–55, and L. David Mech, *The Wolf: The Ecology and Behavior of an Endangered Species* (Garden City, New York: Natural History Press, 1970), esp. chap. 3. For a preliminary attempt to compare the behavior of primates and carnivores to presumed behavior patterns of man's ancestors, see Schaller and Lowther, "The Relevance of Carnivore Behavior to the Study of Early Hominids."

[13] Hans Kummer, *Primate Societies: Group Techniques of Ecological Adaptation* (Chicago: Aldine-Atherton, 1971), pp. 58–61. The tentativeness of all generalizations must be persistently kept in mind in considering observational data from such a recently developed and rapidly changing field as primate behavior study.

dominance hierarchies in some particular primate groups are succinctly reviewed. I have singled out for this treatment studies of rhesus macaques, savanna-dwelling baboons, gorillas, and chimpanzees — primarily because one or more of these species has been commonly treated as the primate from which we might draw the most nearly valid analogies concerning the behavior of our prehominid and early hominid ancestors.[14]

The rhesus macaque is a primarily terrestrial monkey native to India and some neighboring areas of southern Asia. The representatives of this species whose behavior has been most intensively studied, however, live on Cayo Santiago, a small island off the east coast of Puerto Rico; these are descendants of a breeding stock transplanted to this location by a primatologist in 1938.[15]

In his study, Kaufmann found in a troop of about 150 monkeys a clear-cut linear dominance hierarchy among the adult males, as determined by physical displacements of one animal by another and by the direction of aggressive and submissive signals. There appeared to be distinct rank orders both for different groups of males and for individuals within those groupings. Most dominant were mature adult males in a "central hierarchy." Next in line were young adult males who tended to act together as a group to defend against attacks on one of them by other males; some of these young males were beginning to infiltrate the central hierarchy. Lowest in the male rank order were animals that were mainly orphans or sons of females in other bands; because of their usual location in relation to the rest of the band, these are referred to as "peripheral males." (In the study of macaques in India, a similar band structure was found. There was, however, less clear-cut ranking of every individual male, because two males who ranked lower than another individual would frequently team up to become dominant over him.[16] This kind of "coalition behavior" will be noted as significant also for savanna-dwelling baboons and chimpanzees.)

What are the social functions of the dominance hierarchy in the rhesus band? The "alpha" (most dominant individual) male was usually followed by the females in the band who had young infants. Although he infrequently initiated group movement, an initiative was seldom successful unless he participated in it. When the band was on the move, the males in the central hierarchy tended to remain in the center of its ranks, along with most of the females and infants. These dominant males also intervened to stop nearly every fight that was observed to break out between any other members of the band; this was done usually by running toward the combatants and threatening them visually or vocally. Finally, a positive correlation was noted between males' ranks and the extent of their mating behavior; presumably the higher ranking males were most successful in fathering offspring.[17]

Savanna-dwelling baboons live in numerous areas of southern and eastern Africa, and their behavior has been studied fairly extensively in the field.[18] These monkeys are close evolutionary kin to the macaques, and are similar to them behaviorally in many ways. Thus a type of male dominance hierarchy found among some baboon troops appears to be a linear rank order with one adult male clearly and consistently in the alpha position.[19] But in other troops the dominance hierarchy involves a more complex form of the "teaming" or "coalition" behavior observed among macaques in India. (In these studies, dominance was determined by noting relatively stereotyped aggressive sequences among males and, to a lesser degree, by differential access to incentives such as estrous females and food provided by human observers.)[20]

Usually (though not invariably), if there are three or more adult males in the troop, the more complex kind of hierarchy develops. For example, in one troop there were six fully adult males. Three of these animals frequently

[14] For such assertions about baboons and macaques, see Napier, p. 219; about chimpanzees, see Alison Jolly, *The Evolution of Primate Behavior* (New York: Macmillan, 1972), p. 132.

[15] For a study of this species in one of its native habitats, see Charles H. Southwick, Mirza Azhar Beg, and M. Rafiq Siddiqi, "Rhesus Monkeys in North India," in *Primate Behavior*, ed. DeVore, pp. 111–159. Most of the description and analysis of rhesus behavior in the text is drawn from one of the Cayo Santiago studies: John H. Kaufmann, "Social Relations of Adult Males in a Free-ranging Band of Rhesus Monkeys," in *Social Communication Among Primates*, ed. Stuart A. Altmann (Chicago: University of Chicago Press, 1967), pp. 73–98.

[17] Kaufmann, *passim*.

[18] This account is based on K.R.L. Hall and Irven DeVore, "Baboon Social Behavior," in *Primate Behavior*, ed. DeVore, pp. 53–110; and on I. DeVore, "Male Dominance and Mating Behavior in Baboons," in *Sex and Behavior*, ed. Frank A. Beach (New York: John Wiley and Sons, Inc., 1965), pp. 266–289.

[19] Such a structure was reported in five troops by Hall and DeVore, p. 54.

[20] DeVore, "Male Dominance and Mating Behavior in Baboons, p. 269.

teamed with one another to defend against challenges or attacks from other adult males. None of the other three males in the band was ever seen to co-operate with any other individual. Thus, although one of these latter was individually the most dominant male in the band, any two or all three of the "co-operators" together were dominant over him. The latter trio were therefore considered to be the "central hierarchy" of the band. In another band, the significance of "coalition behavior" for dominance structure became clearly evident when one member of a two-male central hierarchy disappeared. Almost at once a formerly subordinate male displaced the remaining member of the central hierarchy and was soon joined in a new coalition of that type by a male that had only recently joined the band.[21] Membership in the troop's central hierarchy seemed to facilitate a male's success in copulating with females at the peak of estrus (when they are most likely to conceive), even as compared to individually *more* dominant males outside the central hierarchy.[22]

The social functions of the dominance hierarchy appear to be quite similar to those discerned in bands of macaques. Troop members ordinarily orient their attention to and follow the cues of the most dominant males. Thus, in troop movements, even though less dominant males usually go ahead of the troop, these animals sometimes get temporarily separated from the body of the troop because the central hierarchy males have taken another direction. As with the macaques, the most dominant males ordinarily remain in the center of the troop on the move, along with females and their infants. As soon as any strange or predatory animal is sighted (usually signalled by a barking sound from one of the peripheral males ahead, behind, or at the side of the troop), the central hierarchy males rush to confront in concert whatever danger may be present. Also like macaques, dominant male baboons — and almost exclusively the most dominant — frequently intervene to break up fights among other members of the troop, usually by means of noisy and menacing, agonistic threats which seldom result in actual fighting. In sum, "the main characteristics of baboon social organization . . . are derived from a complex dominance pattern among adult males that usually ensures stability and comparative peacefulness within the group, maximum protection for mothers with infants, and the highest probability that offspring will be fathered by the most dominant males."[23]

The primate species which are phylogenetically nearest to man are the African great apes — the gorilla and the chimpanzee.[24] The gorilla is an endangered species now confined to certain lowland and mountainous rainforest areas of central Africa. Only the mountain gorilla has thus far been studied in the wild, but considerable attention has been given to its dominance-oriented behavior.[25]

Gorillas live in relatively permanent groups of from two to thirty individuals. They wander daily over large home ranges, feeding on relatively abundant types of plants. A typical group consists of one or more fully mature ("silver-backed") males, several females, half a dozen juveniles and infants, and one or more less mature ("black-backed") males. Also some "lone males" were observed (though no lone females); these animals seemed to associate freely with certain groups but never remained with any group for an extended period of time.

Group organization is quite cohesive. It features a central core composed of a dominant silver-backed male and all of the females and young. All other males, both silver-backed and black-backed, tend to assume peripheral positions as the group spreads out over a relatively small area (rarely exceeding two hundred square feet) to feed. Rank order largely correlates with body size; silver-backed males are dominant over all black-backed males, females, and young. If there are two or more silver-backed males in a group, they are arranged in a linear dominance hierarchy.

Dominance is most often expressed with respect to positions along narrow trails or in favored sitting places. A subordinate animal ordinarily moves aside to be supplanted by a dominant individual; the latter's mere approach or brief stare at the subordinate is usually a sufficient stimulus to effect this change. Occasionally the dominant animal gives the lower-ranking one a light tap with the back of the hand, which always produces movement by the subordinate.

[22] *Ibid.*, pp. 274, 281.
[23] Hall and DeVore, p. 71.
[24] For a lucid explanation of the evidence for this evolutionary relationship, see S. L. Washburn and Ruth Moore, *Ape Into Man: A Study of Human Evolution* (Boston: Little, Brown, 1974), pp. 11–29.
[25] This description is based primarily on George B. Schaller, "The Behavior of the Mountain Gorilla," in *Primate Behavior*, ed. DeVore, pp. 324–367. For a much more elaborate account of the same study, see George B. Schaller, *The Mountain Gorilla: Ecology and Behavior* (Chicago: University of Chicago Press, 1963).

The dominant male in a gorilla group functions as its leader. Every group member seems to be constantly aware of the activity of the "alpha" male, and cues reflecting a change in the activity of the group are taken from him. Every part of the daily routine — travel, location of rest stops and feeding places, time and place of nesting — appears to be largely determined by the leader. In one case of a perceived external threat (the human observer), the leader dropped behind the fleeing group to face the intruder. When the group is moving rapidly, the leader is at or near the front of it; when its movements are slow, he is often located in the center or near the end of the group. Maintenance of order does not appear to be a significant function of the dominant male-leader — primarily because intragroup aggressiveness is confined to staring, snapping at, or bluff-charging another group member. Even these kinds of interactions were extremely rare.[26]

The final species included in this brief survey is the chimpanzee, which lives in rainforest and woodland areas of central Africa.[27] Until very recently, it was believed that chimpanzees do not live in closed, permanent groups, as do savanna baboons and macaques. Jane Goodall reported that, within a large home range, chimpanzees move about in small temporary groups which may consist of any combination of age and sex classes: "The only group that may be stable over a period of several years is a mother with her infant and young juvenile offspring."[28]

But in 1971, dramatic changes began to occur in the life of the Gombe Reserve (Tanzania) chimpanzee population which Goodall and her colleagues have been observing for a decade and a half. The whole large group suddenly divided into two separate groups, which occupied distinct territories and became overtly aggressive toward each other. Young males now "patrol" the boundaries between their group's territory and their "enemy's." These terms may seem overly anthropomorphic, but when such "patrols" sight a lone chimp not be longing to their group, they are likely to chase that individual and attack viciously if the outsider is caught. Several all-out bloody fights between members of these two groups have been witnessed, and at least three infants and three adults have been fatally wounded since early 1974.[29]

The early field reports on chimpanzee behavior[30] also reported such a paucity of dominance-submission interactions that Goodall questioned the feasibility of applying the dominance concept to a local chimpanzee population as a whole. Further study has persuaded her, however, that hierarchy and dominance are central features of chimpanzee group life. Although the hierarchy is not a neat and rigid progression of linear dominance, both high- and low-ranking individuals usually have clear-cut statuses. An individual's rank may vary, depending upon the social-behavioral context (e.g., the presence or absence of other family members), an individual's current motivation level, or the animal's "mood."[31]

However, Goodall determined that, in general, "the social status of each individual was . . . fairly well defined."[32] In dyadic encounters — usually competition for bananas provided by the observers — which animals would prevail became highly predictable. Furthermore, some animals frequently vacated favored resting places when approached by certain others. In such interactions, all females were normally subordinate to all mature males.

The male dominance structure is somewhat similar to that of savanna baboons, although dominance-deference interactions appear to be less frequent among chimpanzees than among baboons. The basic common feature is the

[26] Much more aggressiveness and activity than Schaller noted has been observed by Dian Fossey, who is currently engaged in a much longer-term study of mountain gorillas than was Schaller's. E.g., she observed some skirmishes between gorilla groups and, in three cases, saw lone males enter a group and engage in fights in which infants were killed (Jane Goodall, "Intra-specific Aggression," Lecture delivered to Human Biology Core Course, Stanford University, October 17, 1975).

[27] Most of our information on chimpanzee behavior comes from studies done by or under the direction of Jane Goodall, whose observations in the field began in 1960 and are still continuing. To date (January, 1976) her most comprehensive scientific report is Jane van Lawick-Goodall, "The Behaviour of Free-Living Chimpanzees in the Gombe Stream Reserve," *Animal Behaviour Monographs*, 1, part 3 (1968), 165–311. See also Jane Goodall, "Chimpanzees of the Gombe Stream Reserve," in *Primate Behavior*, ed. DeVore, pp. 425–473 (Jane Goodall and Jane van Lawick-Goodall are the same person); also Vernon Reynolds and Frances Reynolds, "Chimpanzees of the Budongo Forest," in the same volume, pp. 368–424.

[28] Van Lawick-Goodall, p. 167. In their study, the Reynoldses concurred (pp. 393–396).

presence of co-operative, or "coalition"-type behavior within the dominance-competition context in both species. As with baboons, two chimpanzees may combine to express dominance over a single animal to which both "coalition" partners are individually subordinate. But at any time within a group, one male clearly occupies the "alpha" position; he most frequently threatens and sometimes attacks the other males but is almost never attacked and seldom threatened by any of them. Infrequently, certain young but mature males try to displace the current alpha male. Within the Gombe population, three successful attempts have been observed, and in two cases the challenger was supported closely in agonistic encounters by another mature male (known in one case to be the challenger's brother). Some males seem much more highly motivated to engage in dominance competition than do others, and intelligence seems to be more important than size and strength as a determinant of success in rising to the alpha position.[33]

Discerning the adaptive functions of dominance-deference behavior in chimpanzees is very difficult, and the leading observers of their behavior in the wild have largely refrained from speculating on this point. The recent events at Gombe suggest the possibility that the hierarchical order may serve, in most circumstances, to restrain overt expressions of the dangerous — even deadly — aggressiveness which these animals have now surprisingly manifested. But why they are that aggressive is another unsolved evolutionary puzzle; the aggressiveness might be, in part, a phylogenetic holdover from an earlier, savanna-dwelling phase of chimpanzee evolution.[34] But perhaps, ironically, comparisons with human behavior might prove to be the most promising route for arriving at some understanding of intraspecifically lethal, group-territorial aggressive behavior in chimpanzees.

Primate-based Stratification Concepts

A sociologist has recently argued that biologically based proclivities may well be a cause of dominance-deference behavior in various primate species, including man.[35] Mazur points out that status differentiation within established face-to-face groups exists in all known human cultures. Extracting from the sociological literature seven characteristics typical of such status orders, he seeks to compare the behavior of seven primate species — ranging from the most primitive in evolutionary terms, the tree shrew, to man's nearest relatives, chimpanzees and gorillas — with respect to these traits of human groups. On the basis of admittedly incomplete evidence, Mazur concludes that most of these status-relevant behaviors are manifested in subhuman primate species and that a trend seems to exist for more of these traits to appear in species which are closer to than those which are more distant from man on the evolutionary time-scale. He concludes that status differentiation *as such* (i.e., the underlying pattern of motivation for the great variety of particular forms this phenomenon assumes among different groups in diverse cultures) very probably has a "noncultural" (phylogenetic) basis. Indeed, he tentatively advances an even broader suggestion: "Perhaps sociologists whose interests are limited to humans should accept cross-species behaviors as 'given' and requiring no further explanation, as most of us accept hunger and the sex drive as given."[36]

The relevance of primate behavior studies to the understanding of political stratification in human societies may be clarified somewhat through consideration of two theoretical conceptions that have been advanced by primatologists. One of these is an essentially functional concept: Bernstein notes that in numerous species of Old and New World monkeys

[33] Van Lawick-Goodall, p. 212; Goodall, "Social Hierarchy and Dominance."

[34] According to Robin Fox, recent Japanese work indicates that the chimpanzee once had a wider distribution and lived in open territory. When faced with open country, chimpanzee groups became tightly organized in apparent expectation of predatory attacks; for example, such groups exclude young, subadult males. (Robin Fox, "Alliance and Constraint: Sexual Selection in the Evolution of Human Kinship Systems, in *Sexual Selection and the Descent of Man 1871–1971*, ed. Bernard Campbell [Chicago: Aldine, 1972], p. 295.)

[35] Allan Mazur, "A Cross-Species Comparison of Status in Small Established Groups," *American Sociological Review*, 38 (October, 1973), 513–530.

[36] *Ibid.*, pp. 513-514, 517-525, 526. Mazur's argument strikes me as consistent with the primate data and as logically persuasive. I believe that he is unnecessarily restrictive, however, in asserting that "there is no biological justification" for concluding that "large-scale social stratification must also be a noncultural characteristic" (p. 527). While it is certainly correct that macro-stratification has not been observed in nonhuman primates, that is fundamentally because of man's most important species distinction — an enormously developed symbolizing capacity, manifested primarily through language. In a book which Mazur cites because of his apparent disagreement with its authors on this point, Tiger and Fox argue cogently that the macrostructures of human societies exist only because of man's symbolic-cultural capacities but that symbolism mainly and fundamentally expresses variations on a finite number of behavioral themes which may be discerned by means of thorough and careful cross-species comparisons. (*The Imperial Animal*, pp. 10–20, 34–35, 217–18.)

and apes (including the species reviewed above, except perhaps for the chimpanzee), a 'control role," "defending group or troop members against internal and external sources of disturbance, has been recognized . . ." This social role has been noted in nearly all species which manifest strong intragroup dominance relationships and also in some species in which rank order is either difficult to discern or very poorly developed.[37]

Recently Bernstein has suggested that an established rank order within a primate group contributes to the regularity and predictability of individuals' responses and thus to the ordered distribution of roles — essentially to the maintenance of order — within the group. He even concludes that intragroup aggression seems "to be motivated *primarily* by efforts to preserve established social position and to enforce expected patterns of social behavior, rather than resulting from active competition leading to conflict."[38] In sum, social order itself — at least among a number of primate species — may be mainly a consequence of individuals' motivations to establish and maintain places for themselves in a dominance-deference rank order.

A somewhat more highly developed conception — a kind of "proto-theory" — has been formulated by Michael Chance and elaborated by him in collaboration with Clifford Jolly.[39] Chance is leery of functional generalizations, given the fragmentary state of current data on primate behavior. He considers a structural conception to be much more tenable and thus advances the idea of "attention structure" as the behavioral common denominator in most, if not all, rank-oriented primate groups. Instead of differential access to incentives,

> A more rewarding way of defining the dominance status of a supremely dominant individual is that he or she is the *focus of attention* of those holding subordinate status within the same group. . . .
> A redefinition of dominance is now proposed on the assumption that the attention-binding effect of an animal in a group is essentially the quality which puts it in a behaviourally focal position, and which also tends to place it near the group's spatial centre. The dominant animal therefore may be said to dominate the attention of others at most, if not all, times, and usually without specific actions to do so.[40]

In this perspective, the focus is on the behavior of subordinates as much as if not more than on that of dominant animals, and the differential distribution of group members' attention does appear to hold consistently across group structures in many more primate species than is the case with aggressive dominance or linear rank order. Among savanna baboons and macaques the central hierarchy males are very much the predominant focus of attention, both of females, who remain relatively near them, and of peripheral males, who most often remain a certain distance away from the spatial center of the troop. Members of a gorilla group seem to take nearly all their behavioral cues from the dominant silver-backed male, while other mature males remain in locations peripheral to the core of the group. Processes of group movement and of inter-male agonistic competition in chimpanzees indicate that some of these animals tend to exert an attention-binding effect on the others.[41] The "attention structure" concept also seems to account for rank order behavior among species not specifically discussed above, such as Japanese and bonnet macaques and hamadryas baboons.[42]

Of critical importance for Chance's proto-theory is the "concept of attention structure as a *cause* as well as an effect" of dominance.[43] For it is on this hypothesis that Chance and Jolly base their interpretation of charismatic leadership (in Weber's sense) in human societies. Rather than being attended to because of his position in the official dominance hier-

[39] The initial formulation occurs in M. R. A. Chance, "Attention Structure as the Basis of Primate Rank Orders," *Man*, 2 (December, 1967), 503–518; see also Chance and Jolly, *Social Groups of Monkeys, Apes, and Men*, pp. 173–175.

[40] Chance, p. 509. Emphasis in the original.

[41] A particularly dramatic instance of rank-order change — one male's displacing another in the alpha position — can be readily interpreted as demonstrating the importance of attention structure among chimpanzees. This transformation was caused by an adult male's discovering some empty kerosene cans, seizing them, and using them to make an unusually horrendous noise during a ritualistic "charging run," one of the principal forms of dominance competition among adult males of this species. The attention that he thereby drew to himself persisted, and — after several nonviolent agonistic contests — he was deferred to by all other group members, including the previous alpha male. See Jane van Lawick-Goodall, "Some Aspects of Aggressive Behaviour in a Group of Free-living Chimpanzees," *International Social Science Journal*, 23, 1 (1971), 93–95; also van Lawick-Goodall, *In the Shadow of Man* (Boston: Houghton Mifflin, 1971), pp. 112–117.

[42] Chance and Jolly, p. 174. Some criticisms of the "attention structure" conception are mentioned briefly in Alison Jolly, *The Evolution of Primate Behavior*, pp. 192–193.

[43] Chance, p. 511. My emphasis.

archy, the charismatic individual attains some kind and degree of dominance by means of his capacity to attract the attention of individuals who then become his adherents. In times of severe social crisis, confused and frightened people are more likely to attend to individuals who promise them personal or political salvation solely on the authority of that individual's distinctive personhood or the doctrine which he seems to embody. Because such individuals tend to receive attention far out of proportion to their objective ability to remedy the perceived crisis, "in attempting to explain charismatic movements we should look for the operation of an ethologically based attention-binding mechanism." Further evidence for such a "mechanism" is that not infrequently political leaders "capture the primitive allegiance of groups of men without necessarily having displayed a policy at that stage."[44]

Several anthropologists have attempted thus far to apply Chance's "attention structure" concept to the analysis of human political and social status hierarchies.[45]

I shall single out for brief discussion Larsen's formulations, since he seeks to integrate Bernstein's "control role" into the "attention structure" framework. Specifically, Larsen speculates that the control role — "defending group or troop members against internal and external sources of disturbance" — is the primary *function* of the centripetal hierarchical attention *structure*.[46]

From this perspective, Larsen seeks to reinterpret Weber's typology of traditional, legal, and charismatic authority. It seems more parsimonious to propose that there may be only one basic *type* of authority — a centripetal attention structure — and that Weber's "types" represent various stages or manifestations of this pattern. "Charismatic leadership" would thus "be viewed as a raw expression of attention structuring and the process of recreating centripetal hierarchy." This "primitive adaptive process" meets the urgent needs of followers in crisis circumstances, for it "facilitates group cohesion, integration, and stress reduction." Traditional and legal authority can be seen, then, as resulting from the routinization and institutionalization of centripetal attention structures (Weber's "routinization of charisma"), and "successful routinization involves providing the same satisfactions as the primitive pattern does."[47]

Evolution and Dominance

The argument that propensities to learn and persist in some form of dominance-deference behavior may well inhere in the human genotype requires some support from the highly controversial sphere of speculations about man's evolutionary history. The hominid fossil record is extremely fragmentary, certainly does not speak for itself, and obviously includes no fossilized behavior (though much can be discerned about diet from teeth, posture and gait from leg bones, manual dexterity from hand bones, and culture from artifacts associated with bones). Nevertheless, holding that we have inherited behavioral proclivities requires some kind of attempt to reconstruct how and why certain behaviors may have evolved — that is, what their adaptive value could have been for our evolutionary ancestors.

Because this topic is very broad and complex, and to do it justice would require extended separate treatment, I shall focus on only one speculative reconstruction[48] — Robert Bigelow's "The Evolution of Cooperation, Aggression, and Self-Control."[49] This account very ably integrates paleontological, anatomical, genetic, ecological, psychological, historical, anthropological, and ethological data (including a significant emphasis on primate behavior) into an explanatory theory of human evolution in which dominance-deference behavior plays an essential part. (The reader should keep very much in mind, however, that Bigelow's version of man's evolution is presented here only as an *example* of such a reconstruction; it is in no sense "proved" or "definitive" and on numerous points is open to honest disagreement and criticism.) Bigelow's central concern is to explain the evolutionary growth in size of the human brain. The fossil record seems to indicate that the brain in the hominid line has at least doubled and perhaps tripled in average size during the past three million years, and that this trend was apparently an accelerating process, with the bulk of the increase occurring during the past million years or less. Within the perspective of evolutionary time, this is an extremely brief period for a structure as incredibly complex as the

brain of *Homo sapiens* to develop. (An individual's brain size *per se* does not necessarily signify a particular level of intelligence, but in comparisons between species, size correlates very highly with complexity of organization, hence with species-typical intelligence.) Thus some distinctive selective pressures must have been working upon the hominid line; Bigelow's controversial hypothesis is that the most influential of these forces (in conjunction with generally accepted ones such as tool-making and tool-use) was intergroup competition among hominids — not limited to but definitely including aggressive violence.[50]

According to Bigelow, it seems possible, even likely, that this is how we evolved: Early hominids, as primates, lived in social groups; intragroup communication and co-ordination were necessary to protect these ground-dwellers against predators such as lions and leopards.[51] Hominids would have needed a capacity to respond aggressively against attacks, coupled with an ability to control potentially disruptive aggression during intragroup encounters. Groups competed occasionally with others for food and mates, though natural selection would have minimized such competition when hominids were seriously vulnerable to predators and thus needed to attend primarily to their defenses against other species. When such intergroup contests did occur, however, their outcome normally was determined by capacities for aggressive and intelligent group response (which necessitates intragroup cooperation).[52]

As brains and, consequently, social capacities, evolved, abilities to deal more effectively with predators increased so that hominid intergroup competition could, and presumably did, intensify (largely for the territories most capable of supporting a hunting-gathering way of life). On the average the most co-operative, intelligently self-controlled groups would have succeeded in driving competing groups into less desirable peripheral areas. Successful human groups were the selective force which pushed less intelligently co-operative groups into relatively inhospitable habitats, severely lessening their chances of contributing to the genetic future of the species. As intelligence increased, some individuals would have become capable of perceiving the advantages of co-operation with groups other than their own; this would have required not only intelligence but self-control in the form of inhibitions against attacking former enemies. A primary motive of intergroup co-operation, presumably, was to compete more effectively with still other human groups, and the selective premium on an optimal combination of intragroup (or intra-coalition) co-operation and intelligent self-control for the sake of effective intergroup competition would have increased. Success stemming from these traits, in a positive feedback process, would have selected for increased size and complexity of the brain.[53]

At some unknown point in hominid evolution, linguistic communication emerged (presumably as a result of selective pressures for more effective communication, building upon a foundation made up of relatively high intelligence in combination with a typical primate capacity for vocalization of signals).[54] This made possible even more highly co-ordinated intragroup activity and may well have intensified group integration. But language differences made communication even more difficult with members of other groups and would have acted as an additional impetus to intergroup misunderstanding and hostility. Thus, "conceptual and emotional differences between 'us' and 'them' would have been accentuated."[55]

Within this scenario for man's evolution, self-control is critical:

> Capacities for self-control are provided by the actual physical structure of the brain, particularly the cerebral cortex. The result of human evolution was not an array of bodiless "instincts," but a network of physical nerves and endocrine organs. As this physical organization became more complex and efficient it provided greater capacities for learning from experience, for the repression of emotional drives, and hence for more intelligent

[50] Bigelow, pp. 1–3. That there was an important degree of prehistoric intergroup violence is perhaps Bigelow's most controversial — and controverted — point. This is a fairly typical critique of it by an anthropologist: " . . . the evidence for intergroup violent competition is exceedingly weak when we look at modern hunter-gatherer groups, the pre-historic tool assemblages, and fossil remains. I do agree, however, that there probably was competition between groups and that it was most likely linked to relative efficiency of resource exploitation and rate of population growth rather than aggressive interaction." (R. R. Larsen, personal communication.) Goodall's recent observations, discussed above, of group-territorial aggression in chimpanzees may provide some support for Bigelow's speculations.

[51] Note the stress on the evolutionary importance of predation pressures on savanna baboons, in Irven DeVore and K. R. L. Hall, "Baboon Ecology," in *Primate Behavior*, ed. DeVore, p. 49.

[55] Bigelow, pp. 42–43.

self-control. Human capacities for learning, communications, government, science, and art are products of biological evolution, just as running, or any other manifestation of animal behavior, is an expression of the biological potential of interacting muscles, bones, and nerves.[56]

"Self-control" (or apparent inhibition of basic drives) is evidenced in many primates—for example, in thirsty baboons waiting till their group as a unit moves to a water source, in an adult male hamadryas baboon's refraining from copulating with members of a neighbor's "harem," and in a central hierarchy savanna baboon's learning not to respond aggressively and competitively to the initiatives of his "coalition partners." In this context, the dominance hierarchy within a primate group can be seen as an evolved control system at a supra-individual level which tends to reinforce the self-control systems built into the nervous systems of individual group members.[57]

Man, Bigelow believes, is a typical primate in these respects. Without using the precise terms, he emphasizes the "control" function of dominance (and of the rules, laws, and customs enforced by dominant authorities) and, implicitly, the significance of a "centripetal attention structure" for coordinating vital intragroup co-operative efforts during the course of hominid evolution. We have inherited this readiness to learn dominance-deference behavior, and, Bigelow asserts, we still cannot do without effective dominance hierarchies. Like our ancestors, we combine capacities for violence and for self-control, but the latter is not automatically sufficient to control the former. We have learned to extend our co-operative self-control from the small scope of prehistoric clans and tribes to that of groups comprising hundreds of millions, but "We are still learning, and until we have learned to live in peace with one another on a global scale we will have to be restrained — by force, if necessary."[58]

Leaders and Followers

From a perspective which seeks to encompass studies and theories of primate behavior and scientific speculations, such as Bigelow's, about the course and behavioral effects of man's evolution, it may prove useful to attempt to reinterpret in a summary way some social-psychological materials on leader-follower behavior. Fiedler's attempts to describe the nature of leadership in face-to-face groups appear to fit readily within the dominance-deference conception analyzed above: "The leader is one who succeeds in getting others to follow him"[59] (focal point of an "attention structure"). "Leadership, essentially, means power over other people . . . we shall here define the leader as the individual in the group who has the task of directing and coordinating task-relevant group activities"[60] (the "control role").

Fiedler strongly emphasizes the interactional, contextual character of leadership: "there are no leaders where there are no followers. Above all, leadership is a relationship."[61] This accords well, I believe, with ethological-evolutionary perspectives. But before trying to clarify that point, it is necessary to discuss briefly the biological conception that (in its vulgar form) some individuals are "born leaders" (or possess "innate dominance").[62] This idea should not be dismissed out of hand, even though it is obviously very much subject to abuse. Fiedler cites a study which found significant correlations between leadership and certain personality traits — e.g., intelligence, alertness, verbal facility, dependability, aggressiveness, sociability, cooperation, adaptability.[63] It is reasonable to assume that genetic capacities for developing these characteristics (given, of course, a supportive environment) vary widely among individuals. More specifically, Bigelow speculates that individual differences in "social intelligence" — the ability to predict the likely responses of others and to control one's emotional reactions under pressure — may rest, in part, upon a phylogenetic basis.[64]

In addition to abilities conducive to effective leadership, motivation to acquire high rank may also involve an innate component:

> . . . There are chiefs because there are, in any human group, men who, unlike most of their companions, enjoy prestige for its own sake, feel a strong appeal to responsibility, and to whom the burden of public affairs brings its own reward. These individual differences are certainly emphasized and "played up" by the different cultures, and to unequal degrees. But their clear-cut existence in a society as little competitive as the Nam-

bikuara [the Amazon Indian tribe described in the article] strongly suggests to my mind that their origin itself is not cultural. They are rather part of those psychological raw materials out of which any given culture is made. Men are not all alike; and, in primitive societies . . . these individual differences are as keenly perceived and worked out as in our so-called "individualistic" civilization.[65]

However, no case has yet been made that there are any specific genes for generalized dominance or group leadership. It seems more likely that innate individual differences do exist in the capacity for developing certain personality traits which may enable an individual to become a leader in some circumstances but not in others. This hypothesis is compatible with the conclusion that "a person does not become a leader by virtue of his possession of any one particular pattern of personality traits, but the pattern of personal characteristics of the leader must bear relevant relationship to the present characteristics, activities, and goals of the group of which he is leader."[66]

This returns our attention to the subordinate-follower aspect of dominance-leadership, specifically to the "notion of submissiveness as a basic need in those who follow."[67] Much to this point, I believe, are Stanley Milgram's famous (even notorious) social-psychological "obedience" experiments.[68] They involved placing naive subjects in what they were told was a setting designed to test the effects of punishment on auditory memory. The subject would be seated at a genuine-looking (though phony) "shock generator" and instructed to give word tests to the experimenter's confederate, whom the subject believed to be a volunteer participant like himself. Each time the confederate made an error, the experimenter would order the subject to administer an electric shock to the "learner" by closing a switch. The switches were labeled at 15-volt intervals, from 15 through 450 volts. The experiment was actually intended, of course, to determine how many subjects would obey the "scientific authority's" commands to inflict punishment (supposedly) on a person who had done them no harm.

The experiment was run in many versions, and the principal result was quite astounding. Although both students of psychology and psychiatrists had predicted prior to the experiments that fewer than one-half of one percent of the subject would go all the way to 450 volts on the "shock panel," the actual range in most of the experimental variations was from 30 to 65 percent "fully obedient." Even when the confederate, in an adjoining room, banged on the wall and screamed about his weak heart, begging the subject to stop, 60 percent of the subjects were completely obedient to the experimenter.[69]

In Milgram's interpretation, this extremely surprising outcome resulted from many of the subjects forsaking their own autonomous judgment or "conscience" within the experimental context and entering into an "agentic state." That is, the compliant subjects ceased to evaluate or feel responsible for their own actions and came to consider themselves solely as obedient tools of the scientifically authoritative experimenter (all subjects were told that the experimenter would assume full responsibility for any harm suffered by the "shock victim"). Milgram believes that the rate at which the subjects assumed the "agentic" role indicates that the experiments must have tapped motivational sources too profound to be accounted for wholly in terms of the idiosyncracies of individuals' social conditioning. He turns, therefore, to evolutionary, biobehavioral theorizing as a mode of explaining his experimental results.

Essentially, he stresses the existence and importance of dominance structures within many animal societies and the probable survival values of hierarchy — including efficient division of labor, firmness of social organization, and maintenance of internal group order. He believes that natural selection has also built into the human species a propensity to create and maintain hierarchical social relationships, which entails a propensity to learn readily deference to authority: " . . . we are born with a potential for obedience, which then interacts with the influence of society to produce the obedient man." When such a person finds himself in the presence of a perceived authority-figure, his propensity to enter the "agentic

state" is "exceedingly strong, and the shift is not freely reversible."[70]

The evolutionary theorizing of the late C. H. Waddington may help clarify further both the phylogenesis and ontogenesis of Milgram's "potential for obedience." Waddington stressed the protracted character of infant and childhood dependence (a trend that becomes progressively marked in primate species the nearer their evolutionary relationship to man). This dependence is both made possible and required by the human species' very great reliance upon learning as the individual's primary means of developing adaptive behavior. One ability which must be learned is what Bigelow called "self-control." It seems that the mechanism which we have inherited for controlling our own behavior normally involves accepting completely the authority of those on whom we are dependent when very young. The enormous dependence of our species upon cultural life, including moral norms, has resulted in the evolution of a tendency to "overlearn" and overgeneralize submissiveness to authority-figures and the norms which they supposedly represent.[71]

The evidence and ideas herein discussed that bear upon the dynamics and possible evolved mechanisms of "followership" or submissive behavior appear to provide strong support for Chance's and Larsen's stress upon the importance of the active role of subordinates in the "centripetal attention structure" of a dominance hierarchy. It seems quite likely, then, that phylogenetically determined propensities are profoundly influential on both sides of the leader-follower relationship. That hypothesis is strongly supported by a leading theorist of behavioral evolution: "Social individuals must actually inherit a kind of switch mechanism, which allows them to assume either the dominant or the subordinate role according to circumstances."[72]

To this point in my argument I have attempted, by discussing behavior, analogies, and theories concerning primate behavior, scientific speculation about man's evolution, and some social phychological evidence and concepts, to indicate why it is at least probable that "it is in the nature of human beings as members of a species to create hierarchical orders, some members of which necessarily constitute an elite."[73]

Because that hypothesis is very likely to be misunderstood, I should like — before attempting to explore some of its implications for normative political theory — to state as clearly as possible what my argument does *not* include or imply. I am not asserting that political hierarchies are or ever have been founded exclusively on our genetic proclivities; these can only be expressed through particular, distinctive, and varying cultural patterns and circumstances. I do not argue that economic, educational, and family differences among people do not critically affect individuals' placement within political hierarchies. I am not arguing that any single *type* of dominance hierarchy is the only "natural" pattern; nor do I mean that dominance must necessarily be harsh and repressive and involve extremes of stratification. Finally, I am not asserting, nor do I believe, that deliberate attempts to construct or reconstruct orders of political stratification are necessarily futile, in any sense "unnatural," or doomed to failure; I very definitely do not mean to imply that whatever is, is inevitable. The last thing I desire is to revivify the justly discredited ideas of "Social Darwinism."

The circumstances within which human behavioral capabilities evolved make it quite unlikely that the normal dominance hierarchy within hominid groups constituted a harsh and repressive tyranny. Our ancestors lived by means of hunting and gathering their food until the development of settled agricultural patterns about 8-10,000 years ago. Our phylogenetically conditioned behavioral propensities were shaped largely by the exigencies of leading a successful predatory existence.[74] Among the requirements of such a life are co-operation and integration of all mature males in the

[70] Milgram, pp. 123–125, 134. The possibility that Milgram had instead tapped a hidden wellspring of sadistic aggression is belied by the outcome of one version of his experiment. Subjects were allowed to choose the shock level they would use to punish the "learner." Only one of forty moved all the way up the panel to the "450" switch (*ibid.*, pp. 70–72).

[71] C. H. Waddington, *The Ethical Animal* (London: George Allen & Unwin Ltd., 1960), pp. 155–174. Submissive obedience can be, of course, horrendously destructive. E.g., note Hannah Arendt's observation that the vaunted aggressive toughness of Nazi SS men was actually, with few exceptions, "nothing but a myth of self-deception, concealing a ruthless desire for conformity at any price . . . " (Hannah Arendt, *Eichmann in Jerusalem: A Report on the Banality of Evil* [New York: Viking Press, 1963], p. 157.)

[73] Tiger, "Dominance in Human Societies," p. 295.

[74] One of the best brief discussions of the impact of hunting on the evolution of human behavior is Sherwood L. Washburn and C. S. Lancaster, "The Evolution of Hunting," in *Man the Hunter*, ed. Richard B. Lee and Irven DeVore (Chicago: Aldine, 1968), pp. 293–303. See also fn. 10, above.

hunting group. In those circumstances, it seems more than likely that "dominance must tend toward the mild 'leadership' type . . . "[13]

Further, as Tiger and Fox point out, humans must have developed a profound need for significant participation in face-to-face groups. Thus, they aver, we are so often frustrated by the remoteness and impersonality of bureaucracy because it is premised on a denial of our craving for a "primate politics" which involves dealing with a few well-known persons face-to-face. Yet bureaucracy —made possible by the symbolizing abilities of the cerebral cortex, the most recently evolved part of the human brain — persists. It does so not only because of its functional indispensability in complex industrialized societies but because its structure builds upon other motivations which were essential for a successful hunting life — loyalty and orderliness, a sense of belonging to an in-group and hostility to outgroups, hierarchy and competition.[14]

Possible Normative Implications

But however mild or harsh particular dominance structures may be or need to be, some kind of dominance will exist in any human society, along with deferential and obedient patterns of behavior. The evolutionary, primate behavior-based argument for this conclusion is clearly summarized by Jerome H. Barkow:

> How do we know . . . that human prestige-striving and nonhuman primate social dominance really share a common origin, that is, are homologous? Since our ancestors were nonhuman primates and primates exhibit social ranking, our ancestors presumably were socially ranked. We evolved from these ancestors while organized in cooperative bands of hunters and gatherers . . . , and organization implies social ranking. It would seem that at no point during our phylogenesis did we lack social hierarchy. If human and nonhuman social dominance have apparently been continuous, they must necessarily be homologous. Cultural systems of social rank are based on, not opposed to, our primate heritage.[17]

It thus seems probable that Thomas Aquinas's Aristotelian view is correct: " . . . it is natural for man, more than for any other animal, to be a social and political animal, to live in a group. . . . If, then, it is natural for man to live in the society of many, it is necessary that there exist among men some means by which the group may be governed."[18]

I would suggest that this conclusion provides us with a reasonably secure hypothetical basis for theorizing about political obligation and about the problems of shaping political institutions to be optimally responsive to human needs and demands. In the remainder of this discussion, I shall focus primarily on political obligation.

The great progenitors of modern political thought — Hobbes, Locke, and Rousseau — share a critical premise: the radically artificial, contrived, contingent character of any and all political authority. Despite the very important differences among them, all three theorists deny that structures of dominance and deference inhere in human nature and concur on the fundamental significance of the question, what can possibly justify the existence of any kind of political authority and obligation? The answer common to all three: only the consent of individuals.

Hobbes and Locke severely qualified this principle for the sake of political order and stability (Hobbes in fact almost, but not quite, qualified it out of existence.) Rousseau, however, attempted in an absolutely serious and literal way to make of it the sole foundation of the polity. Man was originally free — independent, individually isolated except for brief encounters; by virtue of haphazard circumstances developed small-scale societies of mutual accord; but then fell into the chains of extreme dependence and servitude because of the effects of covetousness as manifested in private property.[19] We now know, of course, as Rousseau could not, that every primate species lives within some kind of ordered social group, and that man was never absolutely "free" in the sense of complete isolation and

[13] William Etkin, *Social Behavior from Fish to Man* (Chicago: University of Chicago Press, Phoenix Books, 1967), p. 140.

[14] Tiger and Fox, *The Imperial Animal*, pp. 48–51. Therefore it seems likely that, in evolutionary terms, "consent" is as old as, in fact coterminous with, "command" in human authority structures. This may be viewed as some degree of validation of Hannah Arendt's insight into the "elementary dynamics" of political life — namely, her recurrent emphasis upon the spontaneity of small-scale participatory political groups during most modern revolutionary upheavals and her insistence upon popular consent as the basis of effective political power. See Hannah Arendt, *On Revolution* (New York: Viking Press, 1963), esp. pp. 259–285; Arendt, "Reflections on Violence," *Journal of International Affairs*, 23, 1 (1969), 14–15.

independence.[80] Further, we have seen that dominance hierarchies exist because they have been adaptive in primate evolution — and in species in which, even by analogy, we cannot say that there is "private property."

Nevertheless, Rousseau was led to set impossible conditions for the legitimacy of authority (though he considered it wise ordinarily to obey all *de facto* authority[81]). From premises like Rousseau's it was logical to conclude, as nineteenth-century anarchists and many socialists did, that putting an end to economic inequality and proletarian servitude would eventually bring the "withering away" of political authority. The government of men will be replaced by the administration of things, as "The society that will organize production on the basis of a free and equal association of the producers will put the whole machinery of state where it will then belong: into the museum of antiquities, by the side of the spinning wheel and the bronze ax."[82]

In no way do I underestimate or denigrate the great contributions of political theorists from Hobbes to Marx toward discrediting and undermining the authority of anachronistic, oppressive, and dysfunctional hierarchies. But a generalized and possibly justified suspicion of all political authorities is not really an adequate reason for remaining attached to beliefs which seem to bear little or no relationship to empirical reality.

For a specific recent example of such a viewpoint, consider Robert Paul Wolff's ideas on political obligation.[83] He assumes that all men have free will and reason, are thereby responsible for their choices, and hence have a *right* to wholly autonomous individual self-governance. Even more relentlessly consistent than Rousseau, Wolff concludes that "all authority is equally illegitimate, although of course not therefore equally worthy or unworthy of support. . . . There would appear to be no state whose subjects have a moral obligation to obey its commands."[84]

Presumably Wolff does not mean his theory of political obligation to be counterempirical and thus, I believe, an irrelevant fantasy, for elsewhere he reveals a peculiar conception of man's relationship to nature: " . . . while the natural world really does exist independently of man's beliefs or desires, and therefore exercises a constraint on his will which can at best be mitigated or combatted, the social world is nothing in itself, and consists merely of the totality of the habits, expectations, beliefs, and behavior patterns of all the individuals who live in it."[85] But it is the fundamental premise of evolutionary biology that man's social behavior is totally a part of the "natural world." If one does not assume the "social world" to be supernatural, it can *only* be "natural." And, given man's primate social nature, there seems to be no more reason to base a normative theory on the assumption that political stratification and authority are contingent and ultimately dispensable than to spend one's life pondering the consequences for society of a dramatic mutation which would suddenly permit every human being to fly without mechanical assistance. Neither project is likely to get off the ground.

The realistic starting point for thinking about political obligation would appear to be not the question, what can justify authority *per se*, but a question something like this: What *kind(s)* of authority structure can be justified under what types of political and social circumstances? In itself, political authority is neither legitimate nor illegitimate; it simply *is*.[86]

In a sense, I am implying the need for an Aristotelian approach to political theory. I do not at all mean that one could or should accept Aristotle's metaphysical premises, ethical system, or political conclusions — but rather that one might set out from the now well-grounded premise that man is *by nature* a political animal and concentrate one's efforts upon trying to

Feuer (Garden City, New York: Doubleday Anchor Books, 1959), p. 394. It should be noted that Engels did not believe that all hierarchical authority would disappear under communism. In an essay on authority, he asserted that authority in the factory was a functional requirement of industrial production and thus unavoidable. In the same essay, however, Engels reiterated: "All socialists are agreed that the political state, and with it political authority will disappear as a result of the coming social revolution, that is, that public functions will lose their political character and be transformed into the simple administrative functions of watching over the true interests of society." ("On Authority," in *Basic Writings*, ed. Feuer, p. 485.)

discern the empirical and normative relationships between particular kinds of societies and differing *types* of political authority structures.

Finally, this quasi-Aristotelian biobehavioral perspective on authority and political stratification seems likely to inspire concern about discovering and preserving effective restraints upon the wielders of political authority. If one believes that hierarchical authority is a historically bounded phenomenon that will disappear in the socially transformed future, one will oppose overweening and arbitrary authority *only* until one's own movement or party gains absolute power (Leninism is the overwhelmingly relevant example). But if one believes to the contrary that political authority structures are very likely to exist, no matter what movement or party rules or what kinds of socioeconomic transformations occur, then one will consider the structure and operations of the authority system to be a problem of both pressing and permanent significance — especially for the great majority of people who are not members of a "central hierarchy."

Referring again to subhuman primate behavior, one should note in this context the intricately adaptive nature of dominance in species such as the savanna baboons. The central hierarchy males keep order within the troop, protect females and their offspring from predators, lead troop movement, and apparently do most of the breeding — passing on the genetic components of their greater than average capacities for co-operation, intelligent leadership, and aggressive defense. Thus males who achieve dominance invariably behave so as to protect the best interests of the troop as a whole.

It is more than evident that in groups and societies of our species this kind of automatic fit between success in dominance competition and effective substantive leadership no longer exists. Presumably a baboon-like congruence between them was present during the hundreds of thousands of millennia when our ancestors lived in small groups which could not survive without effective leadership and co-ordination of efforts in hunting, food-sharing, and group protection. But in populous, complex societies, political authorities are usually removed from the immediate contexts in which their decisions are implemented. They do not therefore get immediate or necessarily reliable feedback on their wisdom or effectiveness — something which no prehistoric hunter chief could avoid when he and his group either fed well or went hungry.

The transferring of authority structures from the context of face-to-face interaction to that of an ultra-symbolic remoteness also makes it much more difficult for the governed to determine how their own condition is actually affected by the decisions of political authorities.[87] And, of course, historical experience indicates that individuals who achieve high political rank may be too ignorant, arrogant, insensitive, or incompetent to cope satisfactorily with important social problems.

Yet dominance structures there will be in social groupings of the human species, and therefore discovering methods to make and keep them responsive to the substantive needs and desires of the society as a whole is a perennial dilemma. Although our complex societies have lost the automatic fit between dominance and adaptiveness typical of primate groups in their normal habitats, there has been in man an enormous development of a relevant generalized trait characteristic of nearly all primate species — the ability to learn how to adapt to varied circumstances.[88] Using that ability and building, no doubt, on our evolved capacity for self-control, men long ago learned and taught the desirability of subjecting the dominant as well as the subordinate to the restraint of custom and then to the more rationalized "rule of law": "Man, when perfected, is the best of animals; but if he be isolated from law and justice he is the worst of all."[89] And, from an evolutionary perspective:

> Laws and social customs are not unnatural impositions from a source somewhere outside biology. They arise from interactions between the cerebral cortex and other parts of a single body, and from interactions between the brains and eyes

[87] See Murray Edelman, *The Symbolic Uses of Politics* (Urbana: University of Illinois Press, 1964).

[88] E.g., female savanna baboons were placed within a group of hamadryas baboons; within an hour each female had learned to remain near and follow the male which had threatened or attacked her. This is normal behavior for a hamadryas female but precisely opposite the usual behavior of a female savanna baboon among males of her own species. Conversely, hamadryas females placed among savanna baboons soon learned not to follow individual males as these females had always done among their own kind. (Kummer, *Primate Societies*, pp. 99–100.) The example cited above (fn. 41) of a rank order change in a chimpanzee group can be viewed as an individual's learning to use a newly available resource — noise-making tin cans — as a device to inhibit the dominance behavior of the alpha male, making it possible for the innovator to rise quickly to the top of the group hierarchy.

Political Processes and Public Expenditures: A Re-examination Based on Theories of Representative Government

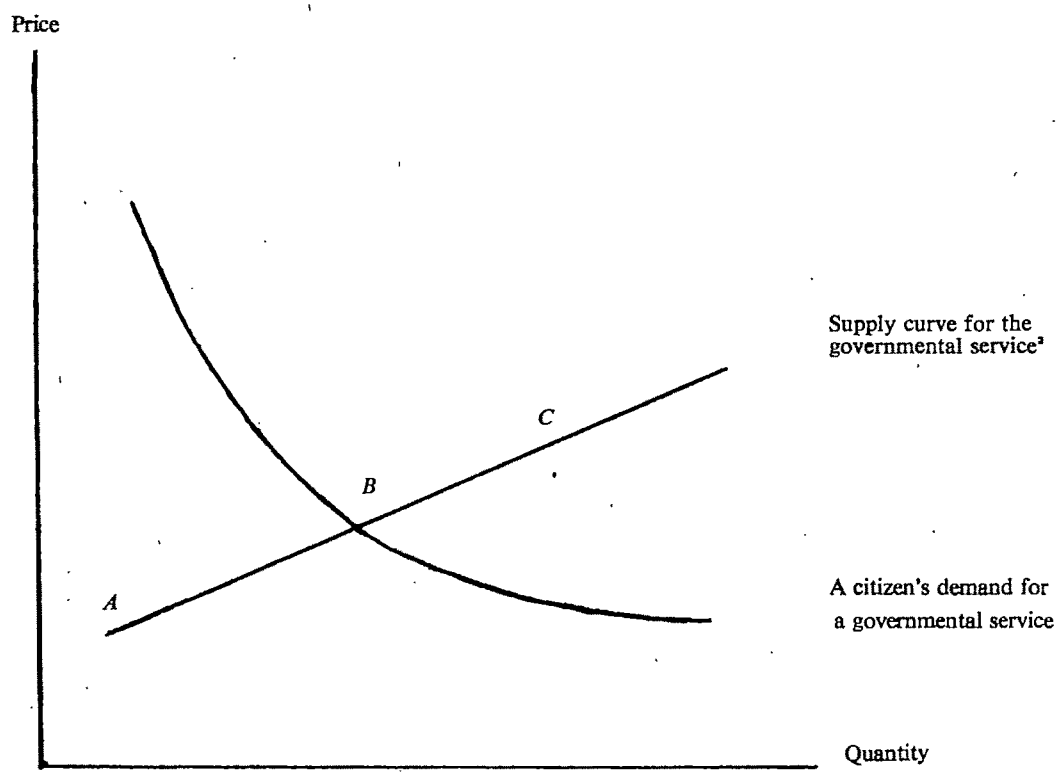
R. KENNETH GODWIN
and
W. BRUCE SHEPARD
Oregon State University

Beginning with Dawson and Robinson, several investigators have attempted to predict local government expenditures from political process variables such as party in power, level of citizen participation, party structure (reformed/unreformed), governor's power, and level of interparty competition.[1] In a large majority of these studies, these variables have not consistently predicted expenditure levels after socioeconomic attributes have been controlled.[2] Our purposes in this article are

(1) To argue that too little attention has been given to theoretical formulations in which political process variables act as linkage mechanisms. The inattention has resulted in the application of inappropriate tests for the effect of political variables on public policies;

(2) To present a method of analysis that, unlike those commonly employed, tests the linkage role of political process variables in policy determination; and

(3) To point out that the research findings based on such methods are compatible with traditional theories of representative government concerning the role which political process variables play in the determination of public policies.



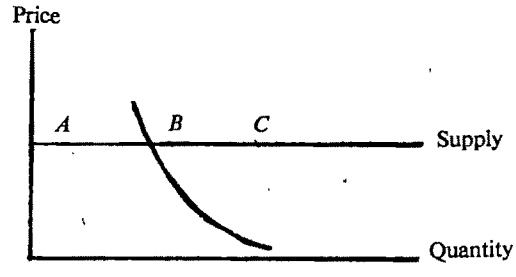
A reconceptualization of the role of political structures and processes in the provision of goods and services may be initiated with several assumptions. First, assume that any given citizen has a demand curve for a service provided by his government such that for every level of price per unit of service provided, the citizen desires a given number of units (see Figure 1). If this assumption is accurate, then so long as the amount of the good provided is at the tax rate equal to the marginal utility of the private good foregone, the citizen's preferences have been accurately represented.

If we can further assume that the production costs curve of the government intersects with the demand curve of the citizens, then accurate representation is possible. In Figure 1, accurate representation would be at point B. If, however, the government supplies a level of the service which does not lie on the demand curve there is an error in the linkage between the expressed preference for a service and the supply. Notice that whether the government provides too little (point A) or too much (point C), the citizen will not be satisfied, and there is an error in the representation of the preference of the citizen by his government.

In making the leap from individual demand to collective demand for public service, previous studies of public expenditures have generally employed socioeconomic variables as surrogate measures of collective demand. Although these socioeconomic variables may not be entirely satisfactory operationalizations of collective demand, their use does appear reasonable. For example, as an individual's income increases, he may wish to purchase more goods from the public sector as well as the private sector. He may desire better educational facilities, police protection, or recreational facilities because he is now capable of paying for these. Or in the case of inferior

[1] See for example: Richard E. Dawson and James A. Robinson, "Inter-Party Competition, Economic Variables and Welfare Policies in the American States," *The Journal of Politics*, 25 (1963), 265–289; Richard I. Hofferbert, "The Relation Between Public Policy and Some Structural and Environmental Variables in the American States," *The American Political Science Review*, 60 (March, 1966), 73–82; Ira Sharkansky and Richard I. Hofferbert, "Dimensions of State Politics, Economics, and Public Policy," *The American Political Science Review*, 63 (September, 1969), 867–879; Ira Sharkansky, "Problems of Theory and Method: Environment, Policy, Output, and Impact," paper delivered at Conference on Measurement of Public Policies in the American States, Ann Arbor, July 28 – August 3, 1968; and Thomas R. Dye, *Politics, Economics, and the Public: Policy Outcomes in the States* (Chicago: Rand McNally, 1966).

[2] For one of the more recent articles and comments on the impact of political variables after controls are made for socioeconomic variables, see Brian R. Fry and Richard R. Winters, "The Politics of Redistribution," *American Political Science Review*, 64 (June, 1970), 508–22; and John L. Sullivan, "A Note on Redistributive Politics," *American Political Science Review*, 66 (December, 1972), 1301–05.



goods[4] — perhaps public health care — less of the inferior good may be desired as increases in income allow for the purchase of substitute goods — e.g., private health care. Similarly, the urban or rural character of an individual's environment may be expected to determine, at least in part, whether he prefers a higher percentage of the government's budget to be spent on the purchase of open space for recreation or for highways which enable him to travel to nearby markets.

Political process variables have generally been treated as causing expenditure levels in the same sense that increases in income, education, or urbanization cause various expenditure levels. Previous studies have placed both socioeconomic variables and political process variables in a single regression equation which is used to predict the level (or distribution) of expenditures in a given state or municipality. While the use of socioeconomic indices as surrogate measures for collective demand is justified, such a treatment is inappropriate for *political process* variables. Using political variables in this manner is inconsistent with those models of representative government which view representation as a process through which the demands of citizens are linked to policy

[3] Albert Breton in *The Economic Theory of Representative Government* (Chicago: Aldine, 1974) has argued that the effect of price on the supply curve should be insignificant — i.e., the tax (price) of public services is constant per unit and has no effect on the shape of the supply curve. If this is the case, Figure 1 would be similar to the figure below.

Demand and Supply of a Public Service

Notice that this assumption by Breton would not change any of the following arguments.

[4] On income prompted demand shifts for inferior goods, see Paul A. Samuelson, *Economics*, 8th ed. (New York: McGraw-Hill, 1970) p. 408.

outputs. Political process attributes should be viewed not as *determinants* of the shape or location of the demand curves of citizens, but as *modifying variables* which either facilitate or inhibit the accurate translation of demands into outputs, i.e., as mediational.

Perhaps we can illustrate the difficulties with previous research concerning public expenditures by returning to the original article by Dawson and Robinson.[5] In their article they hypothesize that environmental conditions are *mediated* by political variables,[6] not that the role of the political variables is *independent.* Dawson and Robinson, however, expected that the political variables (in their study the level of interparty competition) would increase the particular public service (welfare expenditures) because they believed there were excellent reasons for postulating that this particular service was being undersupplied. Using quotes from V. O. Key, Jr. cited by Dawson and Robinson, we can easily see the rationale behind this expectation:

> In the two-party states the anxiety over the next election pushes political leaders into serving the interests of the have-less elements of society, thereby putting the party into the countervailing power operation.[7]
>
> . . . in the one-party states it is easier for a few powerful interests to manage the government of the state without party interference since the parties are not representative of the particular elements that might pose opposition to the dominant interest groups. [8]
>
> . . . over the long run the have-nots lose in a disorganized politics. They have no mechanism through which to act and their wishes find expression in fitful rebellions led by transient demogogues who gain their confidence but often have neither the technical competence nor the necessary stable base of political power to effectuate a program.[9]

In other words, Key believed that unless there were active competition for support for lower-class demands, these demands would go unrepresented. Key was not hypothesizing that political variables, in and of themselves, should exercise an independent effect on expenditure demands. Rather, he was postulating that political mechanisms for aggregating preferences and guiding them through the political system, *when they were effective,* forced the political process to come closer to approximating the demands for services of a larger proportion of the citizenry. With this conceptualization one could plausibly hypothesize that interparty competition would decrease welfare expenditures when the majority of the active citizenry feels that such expenditures have exceeded their demands.[10] As Breton has pointed out:

> One of the most basic problems of welfare economics and one that has plagued that field of inquiry since its very beginning is that of finding out whether non-market organization leads to over- or to underinvestment in certain activities. . . . One should not be surprised . . . to discover that in practice there is overinvestment in some activities and underinvestment in others.[11]

As Breton's comments suggest, increased interparty competition need not consistently affect welfare expenditures in a single direction. Rather, interparty competition and other political variables must be related to the degree of error by a political system in approximating citizen demands (and to the extent that increased party competition increases the accuracy of the approximation, welfare expenditures may be either increased or decreased). For this reason, the inclusion of political variables along with socioeconomic variables in a partial correlation analysis or in a regression equation with welfare expenditures as the dependent variable implies a model which is conceptually inappropriate both to the original expectations of Key and Dawson and Robinson, and to conventional theories of representative government as well.

The Role of Political Variables In Accurate Representation

Although the point may seem trivial, there must be some set of mechanisms—institutions, organizations, decision rules—which link the

[5] Dawson and Robinson, "Inter-Party Competition."
[6] *Ibid.*, p. 266.

[8] *Ibid.*, p. 337.
[9] *Ibid.*, p. 307. Beginning with Dawson and Robinson, the hypothesis that the have-nots lose in a disorganized politics has been repeatedly examined through the study of welfare expenditures and interparty competition. One of the more recent studies finding support for the hypothesis (after allowing for interaction betwen interparty competition and "legislative professionalism") is provided by Edward G. Carmines, "The Mediating Influence of State Legislatures on the Linkage Between Interparty Competition and Welfare Policies," *American Political Science Review,* 68 (Sept. 1974), 1118–1124.
[10] Possible examples of interparty competition forcing a reduction in welfare expenditures are provided by those Scandinavian countries which have been dominated for a long period by Socialist parties; these parties' recent losses in strength have been popularly explained by a "taxpayers' revolt" against welfare expenditures.
[11] Breton, *The Economic Theory of Representative Government,* pp. 192–193.

demands of citizens for the services of government to the policies. This, of course, has been postulated by Herring, Key, Truman, Downs, and other writers on the roles of political parties, interest groups, and elections as the major function of the political system. The difficulty for the researcher is in testing which processes and institutions are performing their linkage function without direct knowledge of whether public services are being over- or undersupplied in relation to citizens' demands. The remaining section of this paper is devoted primarily to the solution of this difficulty.

A theory of democratic representation must postulate some mechanism for linkage between masses and elites or the governed and the governors. Luttbeg has suggested that four traditional models of linkage can be found in political theory.[12] These are the rational-activist, the political-parties, the pressure-groups, and the socialization models. In these models, it is expected that either because of some mechanisms of coercion which the governed can apply to the governors or because of the socialization process which produces political leaders, neither the characteristics of political institutions nor those of political leaders will affect the level or composition of expenditures. Instead, the expected functions of political institutions and leaders are to aggregate the preferences of citizens for services and to translate these directly into the demanded services. That is to say, the governors attempt to implement the wishes of their constituents. Thus as representational mechanisms, political process variables would not be expected to cause particular shapes or locations of demand curves for expenditures. Rather, they would be expected to cause or explain the degree of variation between preference inputs to the representational system and policy outputs.

If political variables are to create a "demand" for expenditures, this "demand" would be caused by specific interests or ideological orientations of the political leadership. That is to say, the political leadership would not be translating (or representing) citizen preferences, but would be using their own preferences to determine expenditure levels or other policy outputs. We will label these conceptions of policy determinants "nonlinkage models." Only in these models would process variables determine the level and distribution of services independently of environmental characteristics.

[12] Norman R. Luttbeg, *Public Opinion and Public Policy: Models of Political Linkage* (Homewood, Illinois: The Dorsey Press, 1968), pp. 1–10.

A brief review of each model of linkage may clarify these distinctions. The rational-activist model of linkage is expected to work as follows:

> The individual is expected to be politically informed, involved, rational, and, above all, active. On the basis of an informed and carefully reasoned set of personal preferences and an accurate perception of the various candidates' positions, the voter is expected to vote for those candidates who best reflect his personal preferences. Thus, if an office holder or candidate neglects the public's wants and demands, the public will sense it and may deny him support in the next election.[13]

A second model of linkage between the governed and their governors is the political parties model. Briefly stated, this model relaxes the requirements which are placed upon the citizen by the rational-activist model. While the citizen must still be aware of the issues, he must only know the positions of the different political parties and choose the party which most closely approximates his own position. The citizen does not need to keep up with all candidates' positions on all issues or their actions while in office. The citizen must, however, know where the parties stand and vote for the party of his or her choice.

The third model described by Luttbeg is the linkage provided by pressure groups. This conception of linkage, like the two above, depends on the votes of the citizens for its coercive aspects. Proponents of this model view individuals as members of social groups and see their preferences for services as being both partially derived from and represented by the interests of the group. Thus, to the extent that the members of a group have leaders who present their interests to elected officials, these officials know what their constituents desire. For linkage to occur, a group's leaders must keep watch over the programs and actions of elected officials and the members of a group need only know and heed the electoral choices advocated by the leaders of the group.

In the fourth model, the socialization description of linkage, much of the coercive power attributed to the electorate in the first three models is replaced by the socialization of leaders. This socialization may be of two types. In its simplest formulation, belief-sharing, Luttbeg postulates that when society is sufficiently homogeneous, it does not matter who are the governors and who are the governed. "Leaders give expression to public wants and demands merely because they share preferences with the

[13] *Ibid.*, p. 4.

public."[14] Although such homogeneity between the rulers and the ruled is difficult to imagine when the governmental unit is the nation, state, or metropolitan area, it is not difficult to see how such a process might work in a water, light, or fire district.

Role-playing is the second and more complex formulation of linkage through socialization. The role-playing model postulates that leaders are socialized to believe in a conception of representation which causes them to attempt to represent their constituency's interests whether or not the electorate can coerce them to do so. Thus, a representative will attempt to develop a set of expenditures which closely approximates the preferences of the governed.

The determination of policy outputs may not depend upon linkage. This could occur in at least two situations. First, the political decision makers might produce policies which are not desired by the citizens but are believed by the decision makers to be in the citizens' "best interests." In the second situation, the incentive structures internal to legislatures and bureaus might require that the decision makers respond to these pressures rather than to citizen preferences. If the policy choices made by decision makers are a function of institutional incentive structures, then those political structure variables thought to covary with the relevant incentive structures may be treated as independent or intervening variables in a model of policy determinants.[15] Political structure variables may also be treated as intervening or independent variables if—due to selection or recruitment biases—decision makers' conceptions of best interests are a function of particular political structures. However, if political structures affect only the opportunity for decision makers to base policy on concepts of best interests, then political structure variables remain mediational, affecting the degree of congruence between preference inputs and policy choices.

The vast majority of studies concerning the impact of political variables upon public expenditures have treated political process variables as determinants of policy levels and types. They are, therefore, designed to test the assumption that policy outputs in the United States are of the form postulated in the nonlinkage models. Findings of no significant independent correlation between political process variables and most expenditure patterns and levels provide evidence that the assumption is often incorrect.

Unfortunately, if one is wedded to single-equation regression models containing socioeconomic and political process variables as the independent variables or causal modeling techniques with political process variables as the intervening variables, then one can do no more than test for the presence or absence of the nonlinkage models. A failure to find evidence for these models may be reassuring to those who hope that representation takes one of the "more democratic" forms; but this mode of analysis does not and cannot reveal which of the alternate types of linkage is operative. Therefore, questions of major theoretical importance remain unanswered.

It is difficult to see how major theoretical and practical questions can be addressed by the commonly employed logic for studying policy determinants. From the perspective of linkage theory, process variables need not cause particular levels or types of policy. They may, however, play an important role as policy determinants to the extent that they influence conformance or disparity between citizen preferences and policy outputs. To analyze the rational-activist, political-parties, interest-groups, or socialization linkage processes requires that one focus on something other than policies as dependent variables. One must study "translation errors" or discrepancies between citizen demands and political system output.

Assuming the availability of a measure of translation error, one may use each of the four models of linkage to deduce hypotheses relating political structure variables to translation error. Within the logic of a given linkage model, certain political structures and conditions should yield specifiable increases or decreases in the amount of translation error. For purposes of illustration, sample hypotheses are given in Table 1.

Empirical analyses which reveal relationships similar or dissimilar to those in Table 1 will permit conclusions about which of the types of linkage is operative.[16] For example, if

[14] Luttbeg, p. 7.

[15] An excellent discussion concerning how the presence or absence of an intervening variable model may be detected can be found in Charles F. Cnudde and Donald J. McCrone, "Party Competition and Welfare Policies in the American States," *American Political Science Review*, 63 (September, 1969), 858–866.

[16] Using the aggregate data normally available for the study of state and local expenditures, one cannot distinguish the belief-sharing and role playing conceptions of the socialization model. If individual data on citizen preferences, elite preferences, and elite perceptions of citizen preferences are available, then one may be able to determine which of these submodels is more appropriate. The two socialization submodels are not competing models: both could be operative.

Table 1. Illustrative Hypotheses on the Relationships Between Political Process Variables and Translation Error for Political Linkage Models

	Relationships Hypothesized Between Specified Variables and Translation Error Under the Assumptions of a Given Linkage Model	
Linkage Model	Variable	Hypothesized Relationship with Translation Error
Rational-Activist	Educational level of population	—
	Newspaper readership index	—
	Level of political participation	—
Political Parties	Degree of party competition	—
	Measures of party strength	—
	Prevalence of nonpartisan elections	+
Interest Group	Indices of interest group strength	—
	Size and activity of interest group memberships	—
	Percentage of labor force which is unionized	—
Socialization	Gini coefficient of income inequality	+
	Religious heterogeneity	+
	Racial heterogeneity	+

translation error is: (a) strongly and inversely related to party competition and party strength; (b) strongly and directly correlated with prevalence of nonpartisan elections; and (c) weakly associated with other variables, then one may conclude that, for the units analyzed, the political-parties model best describes the predominant type of political linkage.[17]

By reformulating the role of political variables, one may do more than test hypotheses such as those in Table 1. Some have recently pointed to the need to study political processes as dependent upon policy.[18] In the mode of analysis we are advocating, it is possible to explore whether a single form of linkage is operative across a wide set of policies or whether different types of policies elicit different types of linkage. This may be done by studying translation errors for a variety of policies. For example, linkages of the interest-group type may be suggested by patterns of translation error arising from distributive expenditures. In the case of more redistributive expenditures, the political-parties model may best conform to the observed pattern of translation errors.[19]

The mode of analysis proposed here may

(None of Luttbeg's models are competing in the sense that they make opposing assumptions. See John L. Sullivan, "Linkage Models in the Political System," in *Public Opinion and Public Attitudes*, ed. Allen R. Wilcox (New York: Wiley, 1974), pp. 637–659.

[17] The analyses may also reveal evidence on nonlinkage models. A finding of consistently high translation errors would support a hypothesis that expenditures are determined according to one of the nonlinkage models. Stated differently, one might suspect that a nonlinkage model is operative only when surrogate measures for citizen preferences (e.g., socioeconomic variables) poorly account for variation in expenditure levels. The "explanatory power" of socioeconomic variables could then be further studied for relationships to political process variables thought to facilitate operation of a nonlinkage model. This is the approach of Robert Lineberry and Edmund Fowler in "Reformism and Public Policies in American Cities," *American Political Science Review*, 61 (September, 1967), 701–716. Evidence of such relationships may permit one to speak of policy biases created by particular political process variables. In nonlinkage models, decision makers' values directly affect expenditure levels. Where most decision makers' values deviate from citizen preferences in a similar direction, then those political process variables which facilitate operation of a nonlinkage model (e.g., low party competition, reformed municipal structures) may appear to affect expenditure levels independently.

[18] See for example: Lewis A. Froman, Jr., "The Categorization of Policy Contents," in *Political Science and Public Policy*, ed. Austin Ranney (Chicago: Markham Publishing Co., 1968), pp. 41–52; and Michael D. Reagan, "Policy Issues: The Interaction of Substance and Process," *Polity*, 1 (Fall, 1968), 36–51.

[19] For a definition and discussion of distributive and redistributive policies, see Theodore J. Lowi, "American Business, Public Policy, Case Studies and Political Theory," *World Politics*, 16 (July, 1964), 677-715; and Robert Salisbury and John Heinz, "A Theory of Policy Analysis and Some Preliminary Applications," a paper presented to the American Political Science Association, Washington, D.C., September, 1968. Printed in *Policy Analysis in Political Science*, ed. Ira Sharkansky (San Francisco: Markham, 1970), pp. 39–60.

also allow one to detect whether type of linkage covaries with such variables as region of the country (when studying state policies) or city size (when analyzing municipal expenditures). This may be done by testing relationships such as those hypothesized in Table 1 within subsets of the units of analysis, those subsets defined by the variables of interest (e.g., region, city size). To illustrate, relationships consistent with the hypotheses advanced under the rational-activist model may typify smaller towns. For large cities, evidence may favor the political-parties model.

The suggested analyses may offer more than the study of political linkage in a manner consistent with existing theory. The models of linkage as presented by Luttbeg lacked integration in an encompassing theoretical framework indicating the type of representation that will occur under particular conditions. Analyses of linkage by policy and political jurisdiction categories provide the opportunity for discoveries that could develop and integrate linkage theory.

To use the suggested mode of analysis in empirical work requires that one operationalize the concept of translation error. Conceptually, translation error may be defined as the absolute value of the difference between actual expenditure level and the expenditure level desired by the collectivity of citizens in a political jurisdiction.[20]

Unfortunately, what may be conceptually simple is not operationally simple. Initially, one may observe that collectivities exist only as abstractions and so do not have directly measurable desires. Therefore, the desires of a collectivity must be defined as a function of individual preferences: that function being some aggregation rule. But as Mueller has indicated, members of the mass public have a difficult time in specifying their preferred mix of public services.[21] Similarly, aggregation rules are not easily known. If the rule were strictly majoritarian and if each citizen had full information and an equal probability of participating in an expenditure decision (or if participation probabilities were unassociated with expenditure preferences, then the amount spent on each expenditure category would reflect exactly the citizen with median preferences.[22] These informational, probability, and majoritarian assumptions are not, however, empirically accurate.[23]

There are not entirely satisfactory solutions to these problems. But given certain assumptions, one can propose a readily estimated measure of translation error. One may assume, as previous studies did, that an individual's social class and the characteristics of his environment will determine his preferences for public services.[24] Or more weakly, one may assume that characteristics such as social class, race, and place of residence are so highly correlated with individual preferences as to be acceptable surrogate measures for preferences in many policy arenas. Then assuming an aggregation rule closer to logrolling than to majority rule,[25]

[20] Note the necessity of using absolute values of the differences. If these were not used, then one is back to the largely atheoretical position that particular political variables affect the *direction* of translation errors. With absolute values, one is specifying that political variables, as linkage mechanisms, affect or cause the *degree* of translation error.

[21] Eva Mueller, "Public Attitudes Toward Fiscal Programs," *Quarterly Journal of Economics*, 77 (May, 1963), 210–234.

[22] For a mathematical proof that such a preference pattern would be exhibited in public expenditure patterns, see Thomas Borcherding and Robert Deacon, "The Demand for the Services of Non-Federal Governments," *American Economic Review*, 62 (December, 1972), 891–901.

[23] Discussions and demonstrations of the empirical inappropriateness of these assumptions abound in the political science literature. For discussions of the absence or presence of information, see Bernard Berelson et al., *Voting* (Chicago: University of Chicago Press, 1954); Angus Campbell et al., *The American Voter* (New York: John Wiley and Sons, 1964); V. O. Key, *The Responsible Electorate* (Cambridge, Mass.: Harvard University Press, 1966); and Eva Mueller, "Public Attitudes Toward Fiscal Programs." For discussions of probability of participation, see Lowi, "American Business," Robert Dahl, *Who Governs* (New Haven: Yale University Press, 1961), and Lester W. Milbrath, *Political Participation* (Chicago: Rand McNally, 1965). For discussions of majoritarian decision making, see Dahl, *Who Governs*, and the many discussions of community power and decision making. A more extensive review of much of the literature relating to these assumptions can be found in Sullivan, "Linkage Models."

[24] This assumption is, of course, simply stating that an individual's attitudes and values are primarily the products of the conditions in which he lives. Whether one accepts a behaviorist (stimulus-response) or cognitive orientation to psychology, this is a reasonable assumption.

[25] There are a large number of both theoretical and empirical reasons for assuming such an aggregation rule. Breton, *The Economic Theory of Representative Government*, has shown that most governments supply more than a single service, that this feature allows representatives certain discretion in the development of the mix of services provided, and that logrolling types of decision rules will be used by the representatives. Similarly, the studies of political decision making in cities and states show that decision rules close to those posited in descriptions of pluralism do, in fact, dominate the decision making process. For a more complete discussion of decision rules and their implications for politics, see James Buchanan and Gordon Tullock, *The Calculus of Consent* (Ann Arbor: University of Michigan, 1962).

one can express the level of expenditure desired by a community as a function of socioeconomic characteristics and price factors. The equation below illustrates such a function.[26]

$$Y_{ij} = a + b_1X_{1j} + b_2X_{2j} \ldots b_nX_{nj} + b_{n+1}P_{1j} + b_{n+2}D_{1j} + e_{ij},$$

where

Y_{ij} = desired per capita expenditures for expenditure category i in political jurisdiction j
a = constant
X's = socioeconomic characteristics of political jurisdiction j
P_{ij} = per capita intergovernmental transfers to political jurisdiction j for expenditure category i
D_{ij} = per capita debt of political jurisdiction j for expenditure category i
e_{ij} = error term
b's = beta weights

If it is assumed, as almost all the evidence previously mentioned would indicate, that process variables do not independently affect observed expenditure levels, then observed expenditures may be used as the dependent variable in order to estimate the coefficients and the constant in the above equation. Once the constant and coefficients are estimated, then Y_{ij} can be estimated for each political jurisdiction. Translation error for expenditure category i and jurisdiction j is then operationalized as the absolute value of the difference between Y_{ij} and the observed level of expenditure in category i for jurisdiction j. As operationalized, the measure may then be used for the analyses previously discussed.[27]

The measure of translation error presented above has the advantage of not requiring any data in addition to those data which are usually gathered in quantitative, public-policy determinant studies. While the measure requires assumptions that one might wish to avoid, it should serve to redirect such studies toward a more theoretically germane mode of analysis. It is hoped that measures of translation error will be refined through attention to individual preferences and aggregation rules. But additional resources expended on improved measurement will be productive only after inappropriate modes of analysis have been dropped and more appropriate modes explored.

Empirical Support for Linkage Theories

As we have noted above, perhaps the most obvious support for the credibility of our proposed approach is the failure of previous studies of political process variables to show an impact either on expenditure levels or on distribution (with the possible exception of welfare expenditures) or on other policy outputs. In addition to this indirect support, several empirical studies of public policies tested process variables for their moderating impact. Lineberry and Fowler in their article, "Reformism and Public Policies," found that in "unreformed" cities, socioeconomic variables explained a significantly higher proportion of city taxes and expenditures than did these same variables in "reformed" cities.[28] This indicates that parties in cities do structure conflict and bring order and focus to public demands and thereby act in accordance with the political parties linkage model described above.

Support for the impact of process variables on policy outputs other than taxes and expenditures has also been empirically demonstrated. Crain, in *The Politics of School Segregation,* found that elected school boards did not inject their own liberalism into board policy as much as appointed board members who were less likely to reflect the demands of the mass public and interest groups.[29]

Empirical support for the socialization models has also been recently demonstrated. Morgan has shown that the belief sharing mecha-

[26] A more precise estimation of public expenditures and their determination would require a multiple equation model in which the endogenous variables would include per capita expenditures, transfer payments, and debt. The exogenous variables could be the socioeconomic characteristics of the political jurisdiction. For examples of these models see Borcherding and Deacon, "The Demand for the Services of Non-Federal Governments," and Theodore C. Bergstrom and Robert P. Goodman, "Private Demand for Public Good," *American Economic Review* 63 (June, 1973), 280–296.

[27] One may no longer distinguish the relative "importance" of environmental and political variables by the variance explained in a common dependent variable when Y_{ij} is treated as a function of environmental variables and $|Y_{ij} - \hat{Y}_{ij}|$ is treated as a function of political variables. Restrictions on the ability to focus on statistically "explained" variance may be a blessing in disguise. As in most empirical work guided by theory, one's interest is in testing the structure and direction of relationships between operationalized theoretical concepts in the linkage models. The empirical congruence of alternative structural relationships may be of major theoretical relevance even when little statistically "explained" variance is at issue. In fact, the linkage models predict that little variance will remain in $|Y_{ij} - \hat{Y}_{ij}|$: most of the variance in Y_{ij} will be explained by environmental variables. The theoretical issue is not, "how important are political variables?" Rather, the issue is: "how are political variables important?"

[28] Lineberry and Fowler, "Reformism and Public Policies."

[29] Robert Crain, *The Politics of School Desegregation* (Chicago: Aldine Publishing Co., 1968).

nism for linkage is applicable in smaller suburban communities in which electoral procedures are not of sufficient strength to require leaders to be responsive to community interests.[30] In addition, Verba and Nie have reported that more homogeneous communities, where higher levels of consensus on policy preferences exist among citizens, show a higher concurrence between the citizens and public officials on policy outputs.[31]

The above studies only begin to test the relationships between process variables and policy outputs which are suggested by the various linkage models. They do indicate, however, the value of returning to the literature on the role of elections, parties, and pressure groups in aggregating and translating preferences.[32]

Summary

The generally weak relationships obtained when political process variables are treated as independent variables predicting public policies have been widely reported. We have argued that such findings do not contradict the significance of political process variables as posited in theories of political linkage. Rather, the methods used fail to permit testing of the range of propositions which can be devised from the theories.

As has been shown, it is possible to make such tests using an alternate mode of analysis that focuses on the study of translation errors —discrepancies between observed policies and the policies desired by citizens of a political jurisdiction. This method of analysis not only permits the examination of existing propositions, but also affords opportunities to explore those relationships which should contribute to the further development of linkage theory.

When faced with the findings of conventional studies of process variables as policy determinants, political scientists usually respond by searching for more and "better" measures of process and policy variables. If existing theories of political linkage are accurate, then the search is vain (leading only to the danger—if the search is long enough—of imputing meaning to those statistically significant associations which regularly occur by chance). There is no denying the importance of measurement problems; but in order to advance research on policy determinants significantly, we argue that researchers need first adopt modes of analysis capable of detecting those policy effects of process variables posited in the existing theory concerning the functions of elections, parties, pressure groups, and socialization of leaders.

W. Norton, 1940); Avery Leiserson, *Administrative Regulation: A Study of Representation* (Chicago: University of Chicago Press, 1942); V. O. Key Jr., *Politics, Parties, and Pressure Groups* (New York: Crowell, 1942); and David Truman, *The Governmental Process* (New York: Knopf, 1951).

Crude Communism and Revolution

DAVID RESNICK
Cornell University

The scholarly study of Marx has been deeply affected by the rediscovery and publication of his early writings, especially the so-called *Economic and Philosophical Manuscripts of 1844*. The recovery of these manuscripts was extraordinarily significant because they gave rise to a radical reinterpretation of the entire corpus of Marx's work. They did not simply represent the discovery of some hitherto unknown phase of Marx's intellectual development. It was well known that Marx was interested in Hegelian philosophy as a young man, but the assumption was that his early writings were primarily of biographical interest; they were important for understanding the genesis of Marx's mature thought, not a key to interpreting them. The revival of interest in the Hegelian roots of Marxism, and the study of Marx's early writings have led to an attempt to provide a general overview of Marx's work which sees the later mature published writings as merely representing a shift in style and emphasis.[1]

Shlomo Avineri is perhaps the most influential and subtle defender of this view. In the introduction to his important study of the social and political thought of Marx he states: "Marx's later writings merely articulate the conclusions at which he arrived at this early stage of his intellectual odyssey. The various economic, social and historical studies undertaken by Marx are but a corollary of the conclusions he drew from his immanent critique of Hegel's political philosophy."[2] Thus, if the early works were once seen as immature, youthful, pre-Marxist writings, the later works are now to be read as mere corollaries of these very works. Though the focus of Marx's work shifted from philosophy to economics, the focus of scholarly work on Marx has shifted from economics to philosophy. This can lead to distortions and misinterpretations of both Marx's early work and his later work. Too great a stress on the Hegelian heritage and the problem of continuity can prevent us from actually reading Marx. The attempt to understand the later writings in the light of the early writings not only gives a misleading reading of the later writings, but tends to project Marx's more developed insights and arguments upon his earlier theorizing.

In a recent article entitled "Marx's Vision of Future Society"[3] Shlomo Avineri makes many of the same points about Marx's account of the stages of socialism as he does in his book *The Social and Political Thought of Karl Marx*.[4] I should like to re-examine the problem since I find myself in rather serious disagreement with Avineri. I shall try to demonstrate that Marx's discussion of the stages of socialism in the *Critique of the Gotha Program* should not be taken as a key to understanding the *Paris Manuscripts of 1844* or vice versa. According to Avineri, when Marx risks a discussion of future society he usually views it in terms of two temporal stages which Avineri dubs Stage I and Stage II. He bases his account of Stage I on two texts, the *Paris Manuscripts* and the *Critique of the Gotha Program*, and claims that Marx's remarks about Stage I in the latter text can be spelled out in more detail by considering his discussion of "crude communism" in the *Paris Manuscripts*. He notes that when Marx mentions "crude communism" he is obviously referring to communist theories other than his own, yet "the language of the manuscript as well as the parallels with the *Critique of the Gotha Program* make it clear that he is talking about what he considers also a historical stage in future development."[5] I find this claim very implausible. I see no warrant in the language of the text for believing that Marx thought of "crude communism" as the next historical stage; nor do I find the parallels with the *Critique of the Gotha Program* persuasive.

In the *Critique of the Gotha Program* Marx explains why he goes into some detail about "equal right" and "fair distribution." He does so

in order to show what a crime it is to attempt "to force on our Party again, as dogmas, ideas which in a certain period had some meaning but have now become obsolete verbal rubbish," and to pervert the realistic outlook of the party "by means of ideological nonsense about right and other trash so common among the democrats and French Socialists."[6] In addition, Marx points out that in general it is a mistake to put the principal stress on the problem of distribution, since the distribution of the means of consumption is only a consequence of the distribution of the means of production. "Vulgar socialism (and from it in turn a section of democracy) has taken over from the bourgeois economists the consideration and treatment of distribution as independent of the mode of production and hence the presentation of socialism as turning principally on distribution. After the real relation has long been made clear, why retrogress again?"[7] I believe that crude communism is the name Marx uses in 1844 to refer to the theories of some vulgar French Socialists; if there is any meaningful parallel between the two texts, it lies in Marx's rejection of such theoretical positions, and his belief in the importance of correct theory for the working-class movement.

David McLellan in his study of Marx's early writing suggests that by "crude communism" in the *Paris Manuscripts* Marx may be referring to two groups, the *Travailleurs Egalitaires* and the *Humanitaires,* which were mentioned by Engels in his article, "The Progress of Social Reform on the Continent," published in 1843. According to Engels, the former "were just like the Babouvists of the great revolution, rather "rough hewn"; they proposed to turn the world into a community of workers and thus to abolish every refinement of culture, science and art as useless, dangerous and aristocratic luxury"; and the latter were "particularly known for their attacks on marriage, the family and similar institutions."[8] Whether or not McLellan is correct about this historical point—and there is absolutely no reason to doubt him—it is important to note that Marx was never an egalitarian. I believe that Marx thought of egalitarianism as an expression of what might be called "The French Ideology," that is to say, politics.

The importance of correct theory for Marx rests on the relationship between theory and practice. If perchance the working class were seized by incorrect theory, then the outcome of a seemingly successful proletarian revolution would not be socialism as Marx understands it. Why else struggle against utopian socialists, bourgeois socialists, reactionary feudal socialists, anarchists, bourgeois democrats, and all the rest? Avineri is worried about the problem of transition: "If the description of Stage I in the *Paris Manuscripts* can sometimes be likened to a society reminiscent of the Soviet Union, what are Marx's guarantees that one may not be stuck in Stage I?"[9] Marx was certainly worried about such a problem; but crude communism of the *Paris Manuscripts* is not Stage I, a healthy infant society destined to grow into a full fledged socialist society. If it ever came into existence it would be merely another manifestation of the evils of capitalism; it would be a bloody abortion.

A Comparison of Two Societies

Since I wish to argue that the *Paris Manuscripts* do not contain a description of the next stage of society which is parallel to the one in the *Critique of the Gotha Program,* I shall refer to what Avineri calls Stage I in the latter as the "cooperative society," and Stage I in the former as simply "crude communism." In order to convince us that the cooperative society is the same as crude communism Avineri points to certain fundamental features which they share; in both "there is no private property in the means of production; everyone is employed by society, and there is an equality of wages."[10] In his book he is a bit more careful, and points out that there is a difference between the two texts on the equality of wages. He notes that in the *Critique of the Gotha Program* "though wages are not egalitarian (and in this respect this description varies from the *Manuscripts*) but depend on production, the principle underlying wage differentials (to each according to his work) remains egalitarian and preserves the bourgeois element of property rights related to commodities as objects of consumption."[11]

Yet this is not a superficial difference, it is absolutely crucial; once we have grasped the implications of this difference, the parallels between the two texts will seem less significant, and Avineri's assertion that, in respect to the cooperative society, "understanding its tone de-

[6] Karl Marx, *Critique of the Gotha Program* in *The Marx-Engels Reader,* ed. by Robert C. Tucker (New York: W. W. Norton & Co., 1972), p. 388.

pends on reading the earlier sketch" will take on a rather different meaning.[12] The important theoretical point is that crude communism is a totally egalitarian society; it is not the result of merely retaining one element of bourgeois right. It is founded on the belief that social ills are the result of the inequalities created by private property; thus, the solution it proposes is to generalize the bourgeois principle, "all men are created equal" (the French Revolutionary principle), and apply this ruthlessly to all forms of inequality. Marx demands a cooperative society which has abolished private property in the means of production, a conclusion which is deduced from an understanding of the dynamics of capitalism; he is rather clear that such a cooperative society is thoroughly inequalitarian and that it transcended the naive hostility to private property which characterized the earlier stages of the socialist movement.

In order to bring out the difference between an egalitarian standard for assigning claims to the objects of consumption, which characterizes the cooperative society and the thorough going egalitarianism as a principle for society itself, which is crude communism, I shall briefly discuss the supposed parallels. In the cooperative society the value of both work and the means of consumption is expressed in terms of socially necessary labor time rather than money. Each worker contributes to the social product, but instead of money wages he receives labor script. His salary is not the exact equivalent of his contribution because a certain amount is deducted for the social fund, yet it enables him to appropriate objects from the common stock for his own use by exchanging his labor script for them. This scheme of distribution employs the same principle as that which regulates the exchange of commodity equivalents in capitalism, so far as this is an exchange of equal values: "a given amount of labor in one form is exchanged for an equal amount of labor in another form." This creates an equal right, but it is still bourgeois right because "the right of the producers is *proportional* to the labor they supply; the equality consists in the fact that measurement is made with an *equal standard*, labor."[13] He goes on to point out that applying an equal standard, labor, as a principle of distribution guarantees an *unequal* distribution of commodities:

> But one man is superior to another physically or mentally and so supplies more labor in the same time, or can labor for a longer time; and labor, to serve as a measure, must be defined by its duration or intensity, otherwise it ceases to be a standard of measurement. This *equal* right is an unequal right for unequal labor. It recognizes no class differences, because everyone is only a worker like everyone else; but it tacitly recognizes unequal individual endowment and thus productive capacity as natural privileges. *It is, therefore, a right of inequality, in its content, like every right.*[14]

Marx then points out another source of inequality: even if two laborers perform the same amount of work and have the same natural endowments, one may be married and the other single, one may have more children than another and the like; thus, with an equal performance of labor and hence "even with an equal share in the social consumption fund, one will in fact receive more than another, one will be richer than another, and so on."[15] Therefore the equal right of labor in the cooperative society which Marx envisages in the *Critique of the Gotha Program* justifies *inequalities* of wealth on the basis of natural privileges; it recognizes and rewards the unequal distribution of talents and abilities; but does not recognize claims based upon differences in need, such as the possession of a family.

Crude communism as Marx envisages it in the *Paris Manuscripts* is a society characterized by greed, envy and animality; it is driven by a hostility to private property as such: "the dominion of *material* property bulks so large that it wants to destroy *everything* which is not capable of being possessed by all as *private property*. It wants to abstract *by force* from talent, etc. For it, the sole purpose of life and existence is direct, physical *possession*"[16] (emphasis in original). Yet as we just saw, rather than trying to eliminate talent by force or any other means, the cooperative society, if anything, encourages individuals to exercise their talents; it incorporates talents concretely as a basic assumption of the distribution of the means of consumption. The argument of the

[14] *Ibid.*

[15] *Ibid.*, p. 388.

[16] Marx, *Economic and Philosophic Manuscripts of 1844* (Selections), in Tucker, p. 68. Note: I have tried to cite readily available translations of Marx's works, but have made slight modifications whenever I thought it helpful. Throughout I have used "transcendence" as a translation of *aufheben* in its various forms, and "alienation" as a translation of *entfremdung* in its various forms. It is always useful to consult the original German, especially when it comes to Marx's more philosophical works. Since some of my analysis of the *Paris Manuscripts* departs from traditional scholary interpretations, all references to the manuscripts will be accompanied by citations to the Marx-Engels *Gesamtausgabe* (Berlin: Marx-Engels Verlag, 1932) I, 3, pp. 111–12, hereafter referred to as *MEGA*.

crude communist seems to be that talent is not something which everyone can possess like a loaf of bread: we can take the property of the rich and divide it up amongst ourselves, but we cannot divide up the talents of the talented, therefore let's eliminate talent as a natural fact.

Marx then goes on to note that the hostility to private property manifests itself in an animal form by "counterposing to *marriage* (certainly a *form of exclusive private property*) the *community of women,* in which a woman becomes a piece of *communal* and *common* property. It may be said that this idea of the *community of women* gives away the *secret* of this as yet completely crude and thoughtless communism."[17] Needless to say there is absolutely nothing about women becoming communal property in the cooperative society. If anything, Marx's remark about the inequalities of wealth caused by the fact that one worker has more children than another might imply that he envisages the existence of a rather traditional family. A cooperative society based on the common ownership of the means of production entails a distinction between *producers* and *means of production;* certainly women are producers, not means of production. The suggestion that the first stage of socialism entails viewing women as property is certainly bizarre.

After showing how crude communism universalizes "human lust" by setting up a community of women, Marx describes how it universalizes human avarice, or the lust for objects. Avarice reappears in a disguised form as envy, and the universalization of envy leads to levelling:

> The thoughts of every piece of private property—inherent in each piece as such—are *at least* turned against all *wealthier* private property in the form of envy and the urge to reduce to a common level, so that this envy and urge even constitute the essence of competition. The crude commonism is only the consummation of this envy and of this levelling-down proceeding from the *preconceived* minimum. It has a *definite, limited* standard. How little this transcendence of private property is really an appropriation is in fact proved by the abstract negation of the entire world of culture and civilization, the regression to the *unnatural* simplicity of the *poor and undemanding* man who has not only failed to go beyond private property, but has not yet even attained to it.[18]

Once again there is nothing about levelling down in the cooperative society; the equal standard of labor does not level down the world of wealth to make everyone's wealth equal.

Only after making these observations does Marx say that "the community is only a community of *labor,* and an equality of *wages* paid but by the communal capital—the *community* as the universal capitalist."[19] This description is very similar to one which Marx employs to characterize Proudhon's theory in an earlier section of the *Manuscripts.* He says, "Indeed, even the *equality of wages* demanded by Proudhon only transforms the relationship of the present-day worker to his labor into the relationship of all men to labor. Society is then conceived as an abstract capitalist."[20] But whether society is conceived of as an abstract capitalist or a universal capitalist, it is not pictured as a cooperative society based on the common ownership of the means of production in crude communism; indeed, there is no cooperation at all.

I take it that the equality of wages in crude communism means that everyone is to be paid the same irrespective of the social value of his work; universal envy would preclude paying a skilled and talented worker any more than an unskilled and bumbling one. The demand is not to increase the total pool of social wealth so that everyone may have more; rather, it entails keeping a watchful eye on your neighbor to make sure he doesn't get any more than you do. Marx exposes the true nature of the crude communist's understanding of a truly human community; equality of wages and the community of work may seem to establish such a community, but their view of the sexual relationship, and their view of work itself betrays them. Crude communism is an extreme egalitarianism which demands the elimination of talents, the redistribution of property out of envy, and the universal prostitution of women out of lust. Such a society would seem very far removed from Stage I of socialism.

But if crude communism in the *Paris Manuscripts* is Marx's way of referring to a grossly inadequate communist theory, and not the first stage of future socialist society, then what of his own theory of communism—communism as "the positive transcendence of private property"? Avineri assigns it to Stage II, parallel to what is referred to in the *Critique of the Gotha Program* as a higher phase of communist society. I believe that this is also a mistake, and arises from reading Marx's early writing in the light of his later work. While an understanding of the philosophical concepts of his early writ-

[17] Marx, *Economic and Philosophic Manuscripts* in *The Marx-Engels Reader,* ed. Tucker, p. 68; *MEGA,* p. 112.
[18] *Ibid.,* p. 69; *MEGA,* p. 112.
[19] *Ibid.; MEGA,* p. 112.
[20] *Ibid.,* p. 66; *MEGA,* p. 92.

ing may help to explicate his later work, a knowledge of the arguments of his later work may also obscure the philosophical concepts of the early writings. I shall try to show that what is called *Kommunismus* in the *Paris Manuscripts* is very different from the *kommunistische Gesellschaft* in the *Critique of the Gotha Program;* I shall argue that it is not intended to correspond to a future *society* at all; it is best understood as a theory which corresponds to a revolutionary movement which will bring about the truly human society. If we want a name for the form of future society envisaged in the *Paris Manuscripts,* an appropriate name would be socialism, and this society is not discussed in terms of stages.

In order to understand what Marx meant by communism in the *Paris Manuscripts* we must see Marx himself historically. When he wrote the *Paris Manuscripts* he thought of himself as a follower of Feuerbach and conceived of the enterprise he was engaged in as positive criticism. Communism was the outcome of the German positive criticism of political economy, and only from this perspective can we understand how Marx thought that communism was related to the next phase of history.

I hope that my discussion of the parallels between crude communism and the cooperative society has at least raised some doubts as to whether Marx thought that crude communism is the next historical stage. But the persuasiveness of the claim that he did rests upon taking what Marx said in 1844 as an amplification of what he said in 1875; to clinch the argument we have to investigate the language of the *Paris Manuscripts.*

The Meaning of Crude Communism

Marx first mentions crude communism in the *Paris Manuscripts* after he has listed a number of social theories, all French. He then asserts that communism is the positive expression of the transcendence of private property, and that its first form is "crude, unthinking communism." Marx starts his discussion of the various theories by making the following cryptic remark: "The overcoming of self-alienation follows the same course as self-alienation."[21] In order to understand the meaning of this, we have to see it as a reference to the positive criticism of political economy: "the overcoming of self-alienation," whatever its other possible meanings, refers to the analytical movement that theory must perform in order to comprehend the phenomenon of private property as alienated labor. I shall discuss the possible historical meaning of this statement below.

In the manuscript given the title "Alienated Labor" which comes before this section, Marx has criticized political economy for proceeding from the fact of private property, but not explaining it. He then goes on to explain private property as alienated, externalized labor, and summarizes his partial results as follows:

> We have considered the act of alienation of practical human activity, labor, in two of its aspects. 1) The relation of the worker to the *product of labor* as an alien object exercising power over him . . . 2) The relation of labor to the *act of production* within the *labor* process. This relation is the relation of the worker to his own activity as an alien activity not belonging to him. . . . We have yet a third aspect of alienated labor to deduce from the two already considered.[22]

Marx then launches into a discussion of man as a species being and concludes: "in alienating from man 1) nature, and 2) himself, his own active functions, his life-activity, alienated labor alienates the species from man."[23] Thus Marx explains private property as alienated labor alienates the *species* from man."[24] Thus (2) the activity of production, and (3) species-being.

Marx also uses the same three aspects to comprehend the transcendence of private property understood as self-alienation. He says:

> *Private property* is first considered only in its objective aspect—but nevertheless with labor as its essence. Its form of existence is therefore *capital,* which is to be transcended "as such" (Proudhon). Or a particular form of labor — labor levelled down, parcelled, and therefore unfree — is conceived as the source of private property's *perniciousness* and of its humanly alienated existence: for instance, Fourier, who, like the physiocrats, also conceived agricultural labor to be at least the *exemplary* type, whilst *Saint-Simon* declares in contrast that *industrial labor* as such is the essence, and now also aspires to the *exclusive* rule of the industrialists and the improvement of workers' condition.[25]

Thus we have the first two aspects, the object and the activity of production. Marx then says, "finally, *communism* is the positive expression of transcendence of private property — at first as *universal* private property."[25] He then goes on to discuss how communism is related to

[21] *Economic and Philosophic Manuscripts,* Tucker, p. 68; *MEGA,* p. 111.

[22] *Ibid.,* p. 60-61; *MEGA,* p. 86.
[23] *Ibid.,* p. 61; *MEGA,* p. 87.
[24] *Ibid.,* p. 68; *MEGA,* p. 111.
[25] *Ibid., MEGA,* p. 111.

man as a species-being, the type of community it posits, how it expresses man's essence and the like. The first form is the one which only generalizes and completes the relations of private property and is called crude communism. I have outlined its main features above, but I wish to point to Marx's concluding summary statement: "the first positive transcendence of private property—*crude* communism—is thus merely one *form* in which the vileness of private property, which wants to set itself up as the *positive community, comes to the surface.*"[26]

He then briefly mentions the second type of communism.

> Communism a) of a political nature still — democratic or despotic; b) with the transcendence of the state, yet still incomplete and being still affected by private property (i.e., by the alienation of man). In both forms communism already knows itself to be reintegration or return of man to himself, the transcendence of human self-alienation; but since it has not yet grasped the positive essence of private property, and just as little the *human* nature of need, it remains captive to it and infected by it. It has, indeed, grasped its concept, but not its essence.[27]

Finally he goes on to discuss the third form of communism:

> *Communism* as the *positive* transcendence of *private property* or *human self-alienation,* and therefore as the real *appropriation of the human* essence by and for man; communism therefore as the complete return of man to himself as a *social* (i.e., human) being — a return become conscious, and accomplished within the entire wealth of previous development. This communism, as fully-developed naturalism, equals humanism, and as fully-developed humanism equals naturalism.[28]

It is rather clear that Marx identifies himself with this third form of communism, which we might call true communism. He has just proved that it is superior to all other communist theories because it is the only theory of the transcendence of private property which truly transcends private property in theory. All communist theories stand on a higher theoretical level than theories like Proudhon's and Fourier's which negate only one aspect of private property. This explains his comment to Ruge in a letter written just before he composed the *Paris Manuscripts* in which he sets out what he is going to prove. He says, "Communism saw the origin of other socialistic doctrines like those of Fourier, Proudhon, etc., not accidentally but necessarily in opposition to itself."[29] Communist theories raise the problem of community, of man's alienation from his species-being; but hitherto existing communist theories have not as yet grasped fully the nature or essence of man. A true communist theory must not only grasp private property as alienation, it must grasp all its aspects. Marx has thus "dialectically" proven the superiority of his theory to the attempt of political economy to explain the movement of private property, and the attempt of various socialist and communist theories to transcend the movement of private property. Hitherto existing proletarian movements have not succeeded in overthrowing private property, and I believe it is a deep assumption of Marx's early writings that only a movement which is based on a theory that transcends private property in theory, will be able to transcend actual private property in practice. I also believe that, with suitable terminological changes, this statement holds true for Marx's later work as well.

We have just seen how Marx criticized the inadequate communist theories because they still remained infected by private property; since they have not yet grasped all the aspects of private property as alienation of the human essence, they are still entrapped. Crude communism is merely universal private property. It posits the abolition of private property in a negative way; it negates private property without grasping its positive essence; it posits the negation of private property, but is not itself truly positive; it is the negative expression of the abolition of private property. It is a theory mired in negativity, infected by private property, and thus it posits the abolition of private property by the negation of private property. True communism, on the other hand, grasps the positive nature of private property, and thus expresses the abolition of private property in a positive way; it expresses the abolition of private property as the negation of the negation. True communism is the positive overcoming of private property as the expression of human alienation; it overcomes alienation because it is the negation of the negation: it is no longer infected by the negativity of private property. True communism is the positive expression of the abolition of private property

because it is not merely the negation, it is the negation of the negation.

I have gone through this bit of dialetics in order to bring out the significance of the following quotation from the *Paris Manuscripts* in which Marx *explicitly* mentions communism as the next stage of history:

> Communism is the position as the negation of the negation, therefore the *actual* phase necessary for the next stage of historical development in the process of human emancipation and recovery. *Communism* is the necessary form and dynamic principle of the immediate future, but communism as such is not the goal of human development — the form of human society.[30]

But if Marx thought that crude communism was necessary for the next stage, because it will correspond to crude socialist theories or some such, he would have referred to communism as the negation. Only true communism is the negation of the negation, and thus only true communism is the phase necessary for the next stage of historical development.

But if true communism is only the next phase of man's liberation, but not the form of human society, what is? Why is true communism only the negation of the negation and not, as it were, in Feuerbachian terms the true positive, positively grounded on itself? Just before he refers to communism as the negation of the negation Marx tells us why socialist man would no longer need atheism in order to overcome the alienation of man from nature:

> Socialism as socialism no longer stands in need of such a mediation: it proceeds from the *practically and theoretically sensuous consciousness* of man and of nature as the *essence*. It is man's *positive self-consciousness* no longer mediated through the transcendence of religion, just as *actual life* is positive, no longer mediated through the transcendence of private property, through *communism*. Communism is the position as the negation of the negation . . . etc.[31]

Marx is drawing a distinction between communism as a revolutionary movement as, say, the union of critical philosophy and the proletariat, and socialism which is the outcome of such a revolutionary process; communism is not a type of society but the means by which a society will be brought into existence.

In the section of the *Paris Manuscripts* given the title, "Critique of the Hegelian Dialectic and Philosophy as a Whole," where Marx is performing the task of positive criticism of Hegel and attempting to reveal the positive or useful aspects of Hegel's dialectic, he discusses the concept of *Aufheben*, or transcendence, as a movement, the movement of externalization taking back itself (Das *Aufheben*, als gegenständliche, die Entäusserung in sich *zurücknehmende* Bewegung). *Aufheben* actually entails the reappropriation of man's objective being through the destruction of the alienated character of the objective world. He once again draws the analogy between atheism and communism:

> Just as atheism as the transcendence of God is the emergence of theoretical humanism, so communism, the transcendence of private property, is the vindication of actual human life as man's property, the emergence of practical humanism. Or, atheism is humanism mediated with itself through the transcendence of religion, and communism is humanism mediated with itself through the transcendence of private property. Only through the transcendence of this mediation, which is, however, a necessary premise, emerges *positive* humanism, humanism emerging positively from itself.[32]

Thus communism is a movement of civil society to transcend private property; it is a movement whose essence is the transcending of private property, but it in turn will be transcended. Yet understood as a movement, it has its history in both theory and practice. Marx certainly knew that communism did not begin with his writing the *Paris Manuscripts* in 1844. To the extent that the statement "the transcendence of self-alienation follows the same course as self alienation" (Die Aufhebung der Selbstentfremdung macht denselben Weg wie die Selbstentfremdung)[33] has a historical meaning, it refers to the past history of the communist movement; it is not about the future of socialist society. Avineri apparently interprets this as a statement about the stages of socialism, understood as the society which is to be established after the proletarian revolution. He says that Marx adds something to the discussion of stages which he presents in the *Critique of the Gotha Program:*

> In the *Mansucripts* Marx adds a further dimension, making the stages of development of communism parallel the stages of the development of communist ideas. The less sophisticated stage of communism seems also to correspond to a less sophis-

[30] Marx, *Economic and Philosophic Manuscripts of 1844* (Selections) in Tucker, p. 79; *MEGA*, p. 126.
[31] *Ibid.*, pp. 78-79; *MEGA*, pp. 125-26.

ticated and more primitive socialist theory. This enables Marx to acknowledge the immense contribution of the first and more primitive theories of socialism while demonstrating their utter insufficiency. He can even point to their dialectical necessity for the full emergence of his own synthesis, but this implies that by themselves they are unsatisfactory.

To Marx the main defect of these socialist theories, and the main defect of the first stage of socialist society, is that they see the abolition of private property only objectively.[24]

This is a rather neat argument, but aside from acknowledging a debt to other socialists, what is the "dialectical necessity" which makes the stages of the future society correspond to the stages of the development of socialist ideas?

Avineri's argument turns on taking "the transcendence of alienation" as referring to a process which will occur in future society. Existing society has a great deal of alienation, alienation is maximized if you will; but alienation will only be overcome in stages, since there is too much of it to eliminate at once. Primitive socialist theories have only understood part of what is necessary to overcome alienation; but a more adequate socialist theory comprehends more, i. e., it overcomes more alienation in theory. Thus a more adequate socialist theory corresponds to a higher stage of socialist society, and a less adequate one to a lower stage. Since Marx says that the overcoming of self-alienation follows the same course as self-alienation, he must mean that the actual overcoming of alienation in future society will follow the same course as the theoretical overcoming of alienation.

I believe that any such interpretation is deeply mistaken and comes from the attempt to project Marx's later formulations upon his earlier theorizing; however useful the theory of alienation is to a deeper understanding of Marx's later work, on this point it leads to a distorted account of how Marx perceived the relation of communist theory to communist practice. In order to see why there is no reason at all to believe that Marx saw any "dialectical necessity" for a socialist society to parallel inadequate and incomplete socialist theories, we must try to reconstruct what Marx thought the task of critical theory entailed; how he conceived of the relationship between a theory which has transcended alienation and a movement which is the positive expression of the transcendence of private property; and why the criticism of other socialist and communist theories was significant.

[24] Avineri, *The Social and Political Thought of Karl Marx*, p. 222.

Critical Theory and Revolutionary Practice

In September of 1843 Marx wrote a letter to Ruge in which he announces his forthcoming trip to Paris, and reflects on the task of critical philosophy. It entails, among other things the criticism of communist theories:

> I am not for setting up a dogmatic standard. On the contrary, we must attempt to help the dogmatists make their dogmas clear to themselves. Especially *communism*, this is a dogmatic abstraction; I have in mind actually existing communism, as Cabet, Dezamy, Weitling, etc., teach it, not some other imagined or possible one. This communism is itself only a separate phenomenon of the humanistic principle, infected by its opposite, private advantage. Dissolution of private property, therefore, is in no way identical with communism, and communism saw the origin of other socialistic doctrines like those of Fourier, Proudhon, etc., not accidentally but necessarily in opposition to itself, because communism itself is only a special one-sided realization of the socialist principle. And the entire socialistic principle, in turn, is only one side of the *reality* of human nature.[25]

I believe that the *Paris Manuscripts* carry out this program of criticism. Marx goes on to say that he does not face the world in a dogmatic way by attempting to announce some new principle:

> We merely show the world why it actually struggles; and the awareness of this is something the world *must* acquire even if it does not want to. The reform of consciousness exists *merely* in the fact that one makes the world aware of its consciousness, that one awakens the world out of its own dream, that one *explains* to the world its own acts . . . It will be evident that there is not a big blank between the past and the future, but rather it is a matter of *realizing* the thoughts of the past. It will be evident, finally, that mankind does not begin any *new* work but performs its old work consciously. Therefore, we can express the aim of our periodical in *one* phrase: A self-understanding (critical philosophy) of the age concerning its struggles and wishes. This is a task for the world and for us.[26]

Thus the task of philosophy is to criticize consciousness, to bring out the inadequacies of the existing modes of understanding the world; to transcend, if you will, all forms of alienated consciousness; and thus to correct and instruct

[25] Marx, letter to Ruge, in Easton and Guddat, pp. 212-13.

[26] *Ibid.*, p. 214–15.

movements which attempt to abolish the conditions causing alienation, by means of a consciousness that has not yet itself transcended alienation.

In an article entitled "Contribution to the Critique of Hegel's Philosophy of Right, Introduction," which Marx wrote between autumn of 1843 and January of 1844 and published in the *Deutsch Französische Jahrbücher*, he proclaims that

> As philosophy finds its *material* weapons in the proletariat, the proletariat finds its *intellectual* weapons in philosophy. And once the lightning of thought has deeply struck this unsophisticated soil of the people, the *Germans* will emancipate themselves to become *men*. Let us summarize the result: the only emancipation of Germany possible *in practice* is emancipation based on *the* theory proclaiming that man is the highest essence of man. In Germany emancipation from the *Middle Ages* is possible only as emancipation at the same time from *partial* victories over the Middle Ages. In Germany *no* brand of bondage can be broken without *every* brand of bondage being broken. Always seeking *fundamentals*, Germany can only make a *fundamental* revolution. The *emancipation of the German* is the *emancipation of mankind*. The *head* of this emancipation is *philosophy*, its heart is the *proletariat*.[37]

The theory which proclaims that man is the highest essence of man is Feuerbach's, and even the metaphor of the unity of head and heart refers to a passage of the *Principles of the Philosophy of the Future*.[38] In August of 1844 while Marx was working on the *Paris Manuscripts* he sent a copy of this article to Feuerbach expressing his admiration for Feuerbach's work and proclaiming:

> In these writings you have given — whether intentionally I do not know — a philosophical basis to socialism, and the communists, too, have immediately understood these works in this sense. The unity of man with man, which is based on the real difference between men, the concept of a human species drawn down from the heaven of abstraction to the real earth, what can this be but the concept of society?[39]

In the Preface to the *Paris Manuscripts* he also acknowledges his great debt to Feuerbach, since positive criticism in general and thus German positive criticism of political economy are founded on the discoveries of Feuerbach.[40] It seems clear that Marx thought the theory that would penetrate the German proletariat was theory which based itself on Feuerbach.

In another article he wrote in August of 1844 Marx refers to his earlier "Critique of Hegel's *Philosophy of Right*" for an understanding of the special talents of the German proletariat. He says, "It must be granted that the German proletariat is the *theorist* of the European proletariat, just as the English proletariat is its *economist* and the French proletariat its *politician* . . . only in socialism can a philosophical people find its suitable practice, thus only in the *proletariat* can it find the active element of its emancipation.[41] Thus it is the task of critical philosophy, of German positive criticism, to construct a theory for the emancpation of the proletariat, and thus the emancipation of mankind. While German economic and political conditions lag behind England and France, its theory is more advanced; German theory cannot be content with criticizing merely some aspect of existing reality, it must be truly radical; it cannot rest with overcoming alienation in one sphere, it must transcend all forms of alienation.

A primitive socialist theory is primitive because of the fact that it arose in more advanced political and economic conditions; that is to say, it does not comprehend fully the essence of private property as human self-alienation. Thus it cannot become the theory of a movement which will transcend private property, because it has not as yet transcended private property in theory. In the *Paris Manuscripts* Marx observes that

> Equality in the *groundwork* of communism is its *political* justification (Bergründung), just as when the German justifies it by conceiving of man as *universal self-consciousness*. It goes without saying that the transcendence of alienation proceeds from the form of alienation which is the *dominant* power, in Germany *self-consciousness*, in France *equality*, because politics; in England the real, material *practical* need taking itself as its standard. It is from this point that Proudhon is to be criticised and appreciated.[42]

Thus other socialist theories are to be understood as theories which are still enmeshed within alienation; only German theory has man-

[41] Marx, *Critical Notes on "The King of Prussia and Social Reform"* (1844), in Easton and Guddat, p. 353.

[42] *MEGA*, p. 134.

aged to break through. Marx then refers to true communism, the negation of the negation, which is his own theory, a theory which has completely broken through alienation and thus overcomes it in consciousness, and says:

> In order to transcend the *idea* of private property, the *idea* of communism is completely adequate; it takes *actual* communist action in order to transcend actual private property. History will create it, and this movement, which we already recognize in *thought* as self-transcending will in reality involve a severe and protracted process.[43]

Thus Marx is claiming that there will be a communist movement based upon theory which will bring forth the new society. The actual communist action which he contemplates is action based upon correct communist theory—theory which fully comprehends the essence of private property as self-alienation, and thus itself transcends alienation in theory.

German positive criticism has created such a theory, and it will probably be the German proletariat which is just emerging that will be infused with this theory, and thus accomplish what no other movement to transcend private property has accomplished. There is no dialectical necessity for the German proletariart to repeat the stages of socialist theory, since it has only just come into existence; it does not possess the English proletariat's belief in economic solutions, nor the French proletariat's faith in political solutions. It has only theory, and since German positive criticism has broken through the alienation of German philosophy, and since the German proletariat has no illusions because it has no history, it will be the class to succeed in actually transcending private property and abolishing alienation in all its forms. It is the task of German critical theory to prevent the emerging proletariat from being infected by other socialist ideas; only thus will it avoid repeating the failures of other socialist and communist movements.

[43] *MEGA*, p. 134.

I do not think that Marx in 1844 had any clear idea of what a socialist society would look like. He was attempting to prove that radical revolution was necessary in Germany and the world; and a radical revolution requires both a material element (a radical class), and a theoretical element (a radical theory). Such a revolution would go further than the French revolution; it would not be simply a political revolution, but a total social revolution of world historical significance. It is the task of criticism to break through all the illusions of civil society, and thus to provide the true theory for the class born without illusions, created by civil society but not a class of civil society—a class destined to create a totally new society which will have abolished the alienation of practical life, just as critical theory has abolished the alienation of the theory of practical life.

Even if my account of Marx's theory in 1844 is correct, it is still the case that he came to believe that communist society will develop in stages. However much the *Paris Manuscripts* anticipate Marx's later work, there is no question that Marx learned a great deal more about existing society and the proletariat. The more one reads the *Grundrisse* and *Capital* the odder seems the suggestion that communist society must repeat the stages of outmoded socialist theories. I have tried to show that Marx did not even believe this in 1844. I have tried to demonstrate that Marx never thought that crude communism was the first stage of future society; and I have felt that a brief discussion of what Marx thought the task of critical philosophy was in 1844 would be more or less adequate. An explanation of the necessarily limited nature of the first stage of socialism as Marx outlines it in the *Critique of the Gotha Program* would entail a much lengthier discussion of Marx's later critique of political economy; just as Marx's conclusion that socialism will entail stages is a more sophisticated view than the one he held in 1844, so its explanation must rest on his more developed theory.

Comment on Resnick's "Crude Communism and Revolution"

SHLOMO AVINERI
The Hebrew University of Jerusalem

The main point of issue between David Resnick's interpretation of Marx's views about socialism and my own hinges upon what "crude communism," as described in the *Paris Manuscripts* of 1844, stands for. Resnick thinks "crude communism" is merely a critical characterization of a number of communist *theories* preceding Marx, most of them French; I claimed that "crude communism" is *both* a description of earlier communist *theories* criticized by Marx *and* a rough delineation of what the first stage of future communist *society* may turn out to be.[1] Athough there are a number of other issues in Resnick's thoughtful article with which I might like to disagree, we have here, in the meaning of "crude communism," a central element in the interpretation of Marx, and I will therefore limit myself in my response to what I hope might be a further clarification of the issues involved.

Let me start from a point of agreement: despite our disagreement about the 1844 *Manuscripts*, both Resnick and myself agree that at least in the *Critique of the Gotha Program* Marx envisaged *two* stages of socialist society and believed that only in the second stage would socialism be fully realized. Resnick calls Stage I in the *Critique* the "co-operative society";[2] he goes into considerable detail about the nature of this stage in his article, and his discussion is mainly aimed at showing how utterly different this "co-operative society" is from the "crude communism" of the *Paris Manuscripts*. I agree with the substance of what Resnick says about this "co-operative society." Yet despite his being aware of the lim ited horizons of this society, which is still en meshed within the constricting concepts o bourgeois right, Resnick seems to me to hav overlooked the fact that Marx himself explicitl pointed out some immanent shortcomings o this society, and that these shortcomings ar very similar to some of the attributes of th "crude communism" of the *Paris Manuscripts* Thus, despite the quite wide-ranging discussio of the "co-operative society," Resnick fails t quote or even mention the following sentenc from the *Critique of the Gotha Program* whic sums up Marx's awareness of the ambivalen nature of Stage I of socialist society:

> What we have to deal with here is a communis society, not as it has *developed* on its own founda tions, but, on the contrary, as it has *emerged* fro capitalist society; which is thus in every respect economically, morally and intellectually, stil stamped with the birth marks of the old society from whose womb it emerges.[3]

Why is it that this has been overlooked b Resnick? The answer is simple enough: if Mar had not written these words, one would be abl to surmise that the "co-operative society," whil still retaining a bourgeois conception of right as an egalitarian distributive criterion, is al ready in every other respect a full-blooded so cialist society and hence cannot in any wa whatsoever be likened to the "crude commu nism" of the *Paris Manuscripts*, irrespective o the question whether this "crude communism' is a mere underdeveloped *theory* of communisn or the first *historical* stage of future communis society. But in the paragraph just quoted abov and omitted by Resnick, this "co-operative so ciety" of the *Critique of the Gotha Program* i explicitly characterized by Marx as bein "stamped [*behaftet*] with the birth marks" o old, bourgeois society. Are these empty words' A society thus stamped, "economically, morall and intellectually," with the stigmata of bour geois society is a very imperfect society indeed certainly not as near-ideal as Resnick make this "co-operative society" appear in his article In the same paragraph Marx goes on to say tha in this society "the same principle prevails a

[1] In this I followed the interpretation initially suggested by Robert C. Tucker, *Philosophy and Myth in Karl Marx* (Cambridge, 1961), pp. 154–6. This interpretation has recently been challenged also by Michael Evans, *Karl Marx* (London, 1975), p. 150, without, however, suggesting any evidence.

[2] Resnick seems to take the term "co-operative society" from the text of the *Critique of the Gotha Program* itself, see: Karl Marx/Frederick Engels, *Selected Works* (Moscow, n.d.), I, 22. The German original, however, is "genossenschaftliche Gesellschaft," which is better translated as "associational society"; see, Marx-Engels, *Werke* (Berlin, 1962), XIX, 19. This is, incidentally, also the term suggested by Marx in the *Communist Manifesto* for the society emerging from the proletarian takeover. But for simplicity's sake, I have decided to follow Resnick's terminology and refer to the first stage of socialist society as described in the *Critique of the Gotha Program* as "co-operative society."

[3] *Selected Works*, II, 23.

that which regulates the exchange of commodities, as far as this is the exchange of equal values," i.e., this society is still characterized by forms of alienation, since it is still ruled by commodity exchange. Had Resnick referred to this characterization of the "co-operative society" by Marx in such ambivalent terms, it would have been much more difficult for him to claim that it is so totally different from the "crude communism" of the *Paris Manuscripts*.

I find Marx's usage of the phrase "economic, moral and intellectual" extremely intriguing and significant, as Marx does not use those terms lightly. In my mind, at least, they seem to evoke a direct echo of the raw nature of "crude communism." Is it too much to suggest that the "economic" birth marks suggest the purely distributive nature of the economic measures of "crude communism," that "moral" stands for the problem involved in the relation to women and that "intellectual" refers to the "abstraction from talent" envisioned by Marx as characterizing "crude communism" in the *Paris Manuscripts*? Am I reading too much into the text? If I am, then I would greatly appreciate an alternative suggestion about what exactly did Marx mean by these "economic, moral and intellectual" birthmarks with which the first stage of socialism is stamped in the *Critique of the Gotha Program*. It seems to me to be too cavalier to overlook this statement when it is quite obvious that Marx registers here a strong reservation about the nature of the first stage of future society, a reservation clearly reminiscent of all that is so repulsive in "crude communism."

This reservation in the *Critique of the Gotha Program* and the context in which it appears have further consequences for the understanding of the underlying structure of Marx's argument about the nature of the transition from captalism to socialism. This transition has to be dialectical, i.e., it cannot be achieved by "leaps" but through an historical process in which every change has to be mediated through the process of *Aufhebung*—a transcendence (here I fully agree with Resnick's rendering of this difficult Hegelian term) which implies (a) abolition, (b) raising to a higher level as well as (c) preservation. Each element in a given historical situation has to be brought to full fruition before it can be transformed and transcended. Hence the bourgeois notion of "equal rights" is brought in Stage I of socialist society (let us continue to call it by the name Resnick gave it, the "co-operative society") to its utmost realization, and it is this ultimate realization which brings out the intrinsic contradictions of this society as well as the potentiality for novel forms inherent in the old structure. The immanent *injustice* in bourgeois concepts of equal rights can never be brought out in bourgeois society itself, for bourgeois society itself can never fully realize this concept. Only the first stage of socialism can *fully* realize and thus also bring out the utter insufficiency of the bourgeois quest for equal rights, as Marx suggests in the *Critique of the Gotha Program:*

> [But] one man is superior to another physically or mentally and so supplies more labor in the same time. . . . This *equal* right is an unequal right for unequal labor. *It is, therefore, a right of inequality in its content, like every right.*[4]

Stage I of socialism as described in the *Critique* is thus merely a negative transcendence of bourgeois society ("negation of the negation"); despite its incompleteness, it is through such a negative transcendence that the ultimate, *positive* transcendence of private property can be achieved; it is only in the second stage, which has the first stage as its dialectical precondition, that "the narrow horizon of bourgeois right [can] be crossed."[5]

Is this so very different from what Marx postulates in the *Paris Manuscripts*? We know, and Resnick acknowledges, that in the *Critique of the Gotha Program* Marx deals with historical stages, not with different theories of socialism, and these stages are necessary given Marx's dialectical understanding of historical development. But let us suppose for a moment that the text of the *Critique of the Gotha Program* had been obscure and cryptic, as I readily grant that the text of the *Paris Manuscripts* is. Could we then not make a convincing argument that given the defects of Stage I (the "co-operative society" of the *Critique*), that Marx could not conceivably have had such a defective society in mind as a stage of future development, and hence one must view this as a mere critique of an undeveloped socialist *theory*—say of Lassalle, whose views are after all very heavily criticized in the same piece of writing? In other words, could not the same argument which Resnick makes about "crude communism" of the *Paris Manuscripts* also be made about the "co-operative society" of the *Critique of Gotha Program?*

If Resnick is right and the *Paris Manuscripts* in their discussion of "crude communism" (as well as of "true communism") refer merely to *theories* of communism, not to historical stages,

[4] *Selected Works*, II 24 (italics in the original).
[5] *Ibid.*

two further difficulties arise: first, it would then appear that Marx totally divorces a discussion of communist theory from historical reality; in such a reading, Marx in 1844 just juxtaposed an underdeveloped theory of communism to his "true" communism, and left it at that, without bothering at all about the historical context in which it could come about. It is precisely at the same period in his development that Marx emphasized the unity of theory and practice, and the *Paris Manuscripts* were written after the *Introduction to the Critique of Hegel's Philosophy of Right* in which the historicity of communist future society had been discussed by Marx in some detail. Furthermore, in the *Paris Manuscripts* themselves Marx correlates the theory of classical political economy with the capitalist mode of production. It would be most surprising and indeed inconceivable that given these theoretical premises Marx would then deal with theories of communism, including his own theory of what Resnick calls "true communism" without at all bothering about its realization, thus leaving it completely abstract. One would have expected him to discuss at least his own theory of communism in relation to an historical, albeit future, dimension as well, and hence view it as a model for a stage of historical development. In Resnick's reading, the discussion of communism in the *Paris Manuscripts* is completely divorced from the level of historical reality, a theoretical discussion wholly separate from historical praxis. This just does not fit into any interpretation of Marx's thought with which we are familiar.

Second, I have tried to show above why a model of *two* stages of socialism, as envisaged in the *Critique,* is immanent in Marx's dialectical understanding of historical change. It would therefore again create theoretical difficulty to suppose that in 1875 he was aware of the dialectical dimension of historical change which necessitates stages, whereas in 1844 (when he was so much more imbued with Hegelian concepts and terminology), such a dialectical dimension escaped his mind and he would be ready to espouse a full-fledged "theory of communism" realizing itself without mediation, "developed on its own foundation," jumping, like Minerva, fully armed straight from Jupiter's brow.

In my book I pointed out that one of the differences between the "crude communism" of the *Paris Manuscripts* and Stage I in the *Critique of the Gotha Program* relates to a different conception of the function of equality and egalitarian criteria in both society. While "crude communism" is postulated as a harshly egalitarian society, the "co-operative society" of the *Critique* uses equal measures for the distribution of wealth and is consequently an unequal society (Resnick is right that I should have emphasized this distinction more forcefully in the *Dissent* article). But the point is that despite the difference, in both models *equality* is the core of the distributive system, and what unites both models is that at this stage of future society socialism is purely *distributive* and is not yet premised on the productive abundance Marx envisages as the precondition for a full-fledged socialist society. This is evidently clear in "crude communism," which is stigmatized by Marx as a "regression to the unnatural simplicity of the poor and wantless individual who has not only not surpassed private property but has not yet even attained it."[6] The same point is implied when in the *Critique of the Gotha Program* Marx says that only in "the higher stage of communist society" have the "productive forces also been increased with the all-round development of the individual, and all the springs of co-operative wealth flow more abundantly"[7] — a state of affairs obviously not yet achieved in Stage I, the "co-operative society." Again, if "crude communism" is merely a description of theories of communism discarded by Marx as underdeveloped, then these theories have something very basic in common with the "co-operative society" of the *Critique* — a merely distributive understanding of the nature of a communist society; thus the "co-operative society" is very similar to various underdeveloped theories of socialism, and the clearcut dichotomy Resnick postulates between the systematic meaning of the *Paris Manuscripts* (mere discussion of the theories of communism) and the *Critique of the Gotha Program* (a detailed discussion of future historical stages of socialist societies) is hopelessly blurred.

Finally I would like to turn to the textual evidence of the *Paris Manuscripts* and to indicate those elements in the texts which suggest to me that Marx is dealing here with varieties of communist theory *as well as* with stages of future communist society.

One should first be made aware of the fact that the text in which this discussion appears, entitled by the editors of the *Manuscripts* "Private Property and Communism" (there is no title in the original ms.) is a commentary, or a lengthy addition or footnote, to another text *which has been lost.* The text starts with

[6] Karl Marx, *Early Writings,* ed. T. B. Bottomore (London, 1963), pp. 153–4.
[7] *Selected Writings,* II, 24.

The words "ad pag. XXXIX", and then, a paragraph later, there is another annotation reading "ad ibidem." The pages to which this citation refers have been lost, so what we have is a truncated manuscript, and this goes a long way to explain the slightly cryptic and esoteric nature of the references in the text.[8]

In this truncated text there are a number of references which suggest that the various types of communism described there are related to each other in a temporal sequence:

But the antithesis between propertylessness and property is still (*noch*) . . .

Private property is first (*erstens*) considered . . .

Finally (*endlich*) communism . . .

Communism in its first form (*in seiner ersten Gestalt*) . . .

The first positive transcendence of private property . . .

Communism, still (*noch*) political in nature . . .[9]

One could perhaps argue that such a temporal sequence could also refer to various theories of communism as they unfold over time. But at the end of this sequence of various forms of communism we have an unequivocal explicit statement:

Thus the whole historical development, both the *real* genesis of communism (the birth of its empirical existence) and its thinking consciousness, is its comprehended and conscious process of becoming.[10]

The discussion, therefore, even when it relates to theories of communism has a much wider connotation: it is a discussion both of the "real genesis of communism" as well as of its "thinking consciousness," i.e., the different theories related to its development. There is in Marx's attitudes to previous theories of communism something reminiscent of Hegel's inclusion of previous schools of philosophy into his own system: they all represent merely a partial truth, but this partial truth was necessary towards the emergence of the ultimate synthesis which incorporates them in its totality. Just as Hegel's philosophy is a dialectical *Aufhebung* of all previous philosophies and contains their essential truth while discarding the inessential and arbitrary elements within them, so Marx's theory of communism is related to previous communist theories. But just as to Hegel every philosophy represented in the form of reflection *(Nach-denken)* the spirit of an age, there may be something similar in Marx's attitude to socialist theories: they represent not only an underdeveloped level of revolutionary consciousness within a not yet fully developed capitalist society, but also, as the "co-operative society" of the *Critique of the Gotha Program* shows unambiguously, partial stages of communist realization. If Marx's theory of communism reflects (or, one should probably say, projects) the ultimate form of socialism, so less articulated theories of communism may reflect (or project) earlier, less articulated, and less differentiated forms of future communist development.

This should not be construed to suggest that Marx envisaged socialist society as having to pass through *all* the various forms of socialist theories: yet whenever Marx described future society (and as we know, he was very reluctant to do so), in the initial stages of this future society one can always discern the footprints of the undeveloped theories of communism. By and large, all these theories had to Marx one common denominator — their inability to grasp the true nature of private property, and hence their inability to overcome it. In his *theory,* Marx claims to have overcome this limitation, but how could this transcendence be achieved on the level of historical, practical *action?* I see no indication in Marx suggesting that his mere discovery in *theory* of the principle of private property would ensure its realization in historical development; society itself, and not only its philosophers or theorists, will have to overcome in practice what has already been transcended in theory. Mere interpretation does not change the world, and though it is a necessary condition for such change, it is not a sufficient one. As Marx himself wrote in the *Paris Manuscripts,* it is the whole historical development, both the "real genesis of communism . . . and its thinking consciousness" which are involved. This is the unity of theory and praxis, and Resnick's interpretation would leave us facing precisely those dichotomies which Marx set out to overcome.

Rejoinder

DAVID RESNICK

I wish to thank Avineri for his response, and attempt to reply in ways which will bring out the differences which exist in our reading of Marx. Much of his criticism centers around the claim that my analysis of communism in the early manuscripts betrays an insufficient attention to the unity of theory and practice. From my reading "it would then appear that Marx totally divorces a discussion of communist theory from historical reality" (p. 1148). In addition my reading would commit Marx to the belief that "his mere discovery in *theory* of the principle of private property by himself would ensure its realization in historical development" (p. 1149). It was certainly not my intention to offer such a reading. Indeed I quoted Marx's statement that "in order to transcend the *idea* of private property, the *idea* of communism is completely adequate; it takes actual communist action in order to transcend *actual* private property."[1] My discussion of Marx's early theory of revolution was intended to make concrete his understanding of the relation of revolutionary theory to revolutionary action. As far as I can see our disagreement does not arise because Avineri's reading of Marx incorporates the unity of theory and practice while mine does not; it turns directly on the interpretation of the unity of theory and practice in the early writings.

Nor do I think that my reading implies that Marx separates his discussion of communist theory from historical reality, it is simply that Avineri and I disagree as to what Marx thought that historical reality was. Our most fundamental disagreement — indeed the source of a great many different concrete points of interpretation — concerns the subject of history in the early manuscripts. There is no question that in the *Critique of the Gotha Program* Marx is discussing types of societies, and that he outlines future historical development as the movement from capitalist society, to the lower stage of communist society, to the higher stage of communist society. But I argue in my paper that the *Paris Manuscripts'* *Kommunismus* should not be equated with *kommunistische Gesellschaft* of the *Critique of the Gotha Program;* the subject matter in the *Paris Manuscripts* is a movement, not a type of society.

From the point of view of the *Critique of the Gotha Program* to ask whether we have achieved the higher stage of communism is to ask what type of a society we are living in; from the perspective of the *Paris Manuscripts* to ask a similar question is to ask what stage have we arrived at in the struggle between capital and labor — i.e., has the revolutionary movement of the proletariat reached its highest and most mature stage? In the *Paris Manuscripts* communism is discussed purely dialectically. Marx says in the *Paris Manuscripts* "*Communism* is the necessary form and dynamic principle of the immediate future, but Communism as such is not the goal of human development — the form of human society."[2] Marx speaks of communism as itself being transcended since it only exists as the negation of the negation, as a movement which struggles against private property. In the *Critique of the Gotha Program* Marx speaks of the higher stage of communism, but he does not say that this stage will in turn be transcended; if we are to accept Avineri's claim that the two texts outline essentially the same course of future history, then we are stuck with the problem of explaining why Marx thought that communism had to be transcended in the *Paris Manuscripts* but not in the *Critique of the Gotha Program.* We could interpret those passages as referring to crude communism not true communism, but we are presented with a pseudo-problem which can be solved only by text torturing, or some elaborate dialectical argument. I submit that my solution is simpler, more cogent, and adequately explains all the relevant passages.

If we accept my claim that communism in the *Paris Manuscripts* refers to a movement, then the objection that my treatment is unhistorical has little to recommend it. As I said in my paper, communism understood as a movement has a history both in theory and practice, and to the extent that Marx's discussion of inadequate communist theories has a historical meaning it refers to the past history of the communist movement. I also believe that Marx's account of this history, as well as the characterization of different communist move-

[1] Marx-Engels, *Gesamtausgabe* (Berlin: Marx-Engels Verlag, 1932), I/3, p. 134, hereatfer referred to as *MEGA.*

[2] *Ibid.,* p. 126.

ments in terms of their origin in different nations with different levels of political, economic and intellectual development is heavily indebted to Engels's article, "Progress of Social Reform on the Continent."[3] In this article Engels gives what he calls a sketch of the history of communism in France. He speaks of Babeuf's communism arising from the first French revolution, and the second revolution of 1830 giving rise to another more powerful communism. This communism spread rapidly during the mid-1830s in the large manufacturing towns of France. Engels says:

> Various secret associations followed each other, among which the "Travailleurs Egalitaires," or Equalitarian Working Men, and the Humanitarians, were the most considerable. The Equalitarians were rather a "rough set," like the Babouvists of the great revolution; they purposed making the world a working-man's community, putting down every refinement of civilisation, science, the fine arts, etc., as useless, dangerous, and aristocratic luxuries, a prejudice necessarily arising from their total ignorance of history and political economy. The Humanitarians were known particularly for their attacks on marriage, family, and other similar institutions. Both these, as well as two or three other parties, were very short-lived, and the great bulk of the French working classes adopted, very soon, the tenets propounded by M. Cabet, "Père Cabet" (Father C.), as he is called, and which are known on the continent under the name of Icarian Communism.[4]

He also says of these Icarian Communists that "they have embodied in their plans everything rational they found in Saint-Simon and Fourier; and, therefore, are very much superior to the old French Communists."[5] In his analysis of Fourier he makes the crucial observation, "There is one inconsistency, however, in Fourierism, and a very important one too, and that is, his nonabolition of private property."[6]

It is my belief that in the *Paris Manuscripts* Marx offers a critical analysis of communism based upon Engels historical sketch. Engels distinguishes two stages of the modern communist movement, the crude stage and the contemporary Icarian Communist stage. If we turn to the *Paris Manuscripts* we see that Marx analyzes communism in three stages; his discussion is numbered (1), (2), and (3).[7] Under (1) he discusses crude communism; under (3) he sets forth what I have called "true communism," Marx's own theory, the necessary form and dynamic principle of the immediate future; but under (2) he gives only the briefest outline; he calls it "Communism (a) of a political nature still — democratic or despotic (b) with the transcendence of the state, yet still incomplete, [*aber zugleich noch unvollendetem*] and being still affected by private property (i.e. by the alienation of man)."[8] I believe that under (2) Marx had in mind the higher type of communism that Engels describes. Marx characterizes what we have been calling "crude communism" as "this as yet completely crude and thoughtless communism [*dieses noch ganz rohen und gedankenlosen Kommunismus*],"[9] but when he refers to the Communism of Cabet in a later passage he characterizes it as "the still immature communism [*noch unvollendete Kommunismus*] which seeks proof of itself in various historical phenomena opposed to private property."[10] Thus Marx distinguished crude and thoughtless communism from the higher but still incomplete type represented by the Icarian communists.

This second higher form is dialectically related to other theories and movements because it unites the rational plans of the utopian socialists with the demand for the abolition of private property put forth by early crude working class movements arising from the French revolution. Marx held that his own theory raises this historical movement to a higher level because it incorporates all the positive moments embodied in the history of the struggle against private property, but adds to it an understanding of the positive nature of private property as well as the human nature of need.

On the First Stage of Communist Society

In my article I argued that what I called the co-operative society, the lower stage of communist society as depicted in the *Critique of the Gotha Program* was so different from what Marx calls "crude Communism" in the Paris Manuscripts as to hardly support the claim that Marx thought of crude communism as an outline of the first stage of future communist society. In his reply Avineri says that in my comparison of the two societies I depict the co-operative society as "near ideal," and that

[3] Frederick Engels, "Progress of Social Reform on the Continent" in Karl Marx, Frederick Engels *Collected Works*, Vol. 3 (New York: International Publishers, 1975), pp. 392–408.
[4] *Ibid.*, p. 397.
[5] *Ibid.*, p. 398.
[6] *Ibid.*, p. 395.
[7] *MEGA*, pp. 111–114.
[8] *Ibid.*, p. 113.
[9] *Ibid.*, p. 112.
[10] *Ibid.*, p. 114.

if I had attended to Marx's description of "the imanent shortcomings" of this society it would become apparent that the differences are far outweighed by the similarities. Specifically he says that I fail to mention or quote the following passage which sums up Marx's awareness of the ambivalent nature of the first phase of communist society:

> What we have to deal with here is a communist society not as it has *developed* on its own foundations, but, on the contrary, just as it *emerges* from capitalist society; which is thus in every respect, economically, morally and intellectually, still stamped with the birthmarks of the old society from whose womb it emergers.[11]

Avineri then asks what I trust is merely a rhetorical question, "Why is it that this has been overlooked by Resnick?" He claims to see in the phrase "economic, moral, and intellectual" a direct echo of crude communism and offers the tentative suggestion that by "economic," Marx meant to suggest the purely distributive nature of "crude communism"; that "moral" stands for the problem of the relation to woman; and that "intellectual" refers to "abstraction" from talent. But he also says that he would be interested in an alternative suggestion.

First, I would like to note that I did not simply overlook this passage. The main focus of my article was on Marx's early writings, and as I observed in the last page of my article an explanation of the necessarily limited nature of the first stage of communist society as Marx outlines it in the *Critique of the Gotha Program* would entail a lengthy discussion of the later works, especially the *Grundrisse* and *Capital*. But since Avineri claims that it is "too cavalier" of me to overlook this problem, I feel called upon to at least enter the lists. While I do not intend to offer the detailed analysis which this topic demands, I would like to present a different interpretation of the co-operative society from that offered by Avineri. I hope this will shed some light on what Marx meant by the limitations of the co-operative society, and in addition explain why he thought that such a society could serve as a foundation for a higher stage of communism while a society organized along the lines of "crude communism" could not.

In his response Avineri claims that crude communism and the co-operative society share one fundamental limitation whether one thinks of them as theories of socialism or as future socialist societies. He says as theories they both have "a merely distributive understanding of the nature of communist society," (p. 1148); and also that "what unites both models is that at this stage of future society socialism is purely *distributive* and is not yet premised on the productive abundance Marx envisages as the precondition for a full-fledged socialist society" (p. 1148). I think that this is an incorrect interpretation of the theory of the first stage of socialism which Marx presents in the *Critique of the Gotha Program*. The tendency to think of socialism in terms of distribution is one of the theoretical weaknesses he detected in the *Gotha Program* itself. After discussing the problem of distribution in the first stage of socialism Marx says: "Quite apart from the analysis so far given, it was in general a mistake to make a fuss about so-called distribution and put the principal stress on it. Any distribution whatever of the means of consumption is only a consequence of the *distribution* of the conditions of production themselves."[12] For Marx the most fundamental feature of a socialist society, whether fully developed or not, is that it rests upon a qualitatively different mode of production from that of capitalist society. Marx very clearly points out that "vulgar socialism (and from it in turn a section of the democracy) has taken over from the bourgeois economists the consideration and treatment of distribution as independent of the mode of production and hence the presentation of socialism as turning principally on distribution. After the real relation has long been made clear, why retrogress again?"[13] Indeed it is very difficult to understand what Marx says about distribution without a thorough grounding in Marx's theory of production.

This leads me to another criticism of Avineri's account of the first stage of socialism. He cites the following passage from Marx's account of this stage in the *Critique of the Gotha Program*: "the same principle prevails as that which regulates the exchange of commodities, as far as this is the exchange of equal values"[14] and takes it to mean that "this society is still characterized by forms of alienation, since it is still ruled by commodity exchange." I take it Marx's belief that a society ruled by commodity exchange would be characterized by alienation, rests upon his analysis of commodities, especially the famous section of *Capital*

[11] Karl Marx, *Critique of the Gotha Program* in *The Marx-Engels Reader*, ed. by Robert C. Tucker (New York: W. W. Norton & Co., 1972), p. 386.

[12] *Ibid.*, p. 388.
[13] *Ibid.*, p. 388.
[14] *Ibid.*, p. 387.

in which Marx describes the fetishism of commodities. Although alienation as a central analytic concept is absent from Marx's later published writings — it still plays a very important role in the *Grundrisse* — his discussion of commodities shows that he is dealing with similar themes in a different language. If we accept this view, then the claim that the cooperative society as outlined in the *Critique of the Gotha Program* is ruled by commodity exchange is extremely important. If Marx believed this, then I would agree with Avineri that he would be very ambivalent about it; I simply do not think that he had any such belief.

Rather than a society ruled by commodity exchange, the cooperative society, I would argue, is presented as a society which is characterized by the *absence* of commodity production; and this very absence of commodity production is a necessary condition for progress to a higher stage of comunmist society. I believe the analytical model for the first stage of communist society as discussed in the *Critique of the Gotha Program* is contained in the section of *Capital* entitled "The Fetishism of Commodities and the Secret thereof." Marx asks us to picture to ourselves

> . . . a community of free individuals, carrying on their work with the means of production in common, in which the labour-power of all the different individuals is consciously applied as the combined labour-power of the community. . . . The total product of our community is a social product. One portion serves as fresh means of production and remains social. But another portion is consumed by the members as means of subsistence. A distribution of this portion amongst them is consequently necessary. The mode of this distribution will vary with the productive organization of the community, and the degree of historical development attained by the producers. *We will assume, but merely for the sake of a parallel with the production of commodities, that the share of each individual producer in the means of subsistence is determined by his labour-time.* Labour-time would, in that case play a double part. Its apportionment in accordance with a definite social plan maintains the proper proportion between the different kinds of work to be done and the various wants of the community. On the other hand, it also serves as a measure of the portion of the common labour borne by each individual, and of his share in the part of the total product destined for individual consumption. The social relations of the individual producers, with regard both to their labour and to its products, are in this case perfectly simple and intelligible, and that with regard not only to production but also to distribution[15] (emhasis added).

Marx then goes on to say "The life-process of society, which is based on the process of material production, does not strip off its mystical veil until it is consciously regulated by them in accordance with a settled plan."[16] The mode of distribution which Marx suggests in this model of a co-operative society in *Capital* is exactly the same as the one he describes in the *Critique of the Gotha Program.*

In addition, to characterize this principle of distribution according to contribution to the social product as still bourgeois right because "the same principle prevails as that which regulates the exchange of commodities, as far as this is exchange of equal values" (pp. 1146–47) is very different from claiming the principle of equal rights applies to the exchange of commodities as it does in capitalist society itself. In *Capital* Marx observes that the nature of the exchange of commodities itself imposes no limit on the working day, on the amount of surplus value which the capitalist can extract from the worker. In capitalist society labor itself becomes a commodity, and this creates an inherent contradiction in the concept of equal rights in exchange. In reference to the determination of the working day Marx notes: "There is here, therefore, an antinomy, right against right, both equally bearing the seal of the law of exchanges. Between equal rights force decides. Hence is it that in the history of capitalist production, the determination of what is a working-day, presents itself as the result of a struggle, a struggle between collective capital, i.e., the class of capitalists, and collective labour, i.e., the working-class."[17] It is clear that in capitalist society the exchange of commodities is more than simply the exchange of equal values; the equality of rights in capitalist society obscures the conflict between capital and labor which is a necessary feature of a society built upon the extraction of surplus value.

Thus we can see that the equality of rights in distribution which characterized the first stage of communist society is not the full fledged bourgeois equality of rights under the law of exchange of capitalist society, since the exploitation of labor by capital has been abolished. Furthermore, the equality of rights in distribution is adopted by a communist society

[15] Karl Marx, *Capital*, Vol. 1 (New York: International Publishers, 1967), pp. 78–79.

[16] *Ibid.*, p. 80.

[17] *Ibid.*, p. 235.

— a society which has eliminated commodity production, and thus does not suffer the form of alienation which is inherent in such a form of production; a society in which "the social relations of the individual producers, with regard both to their labour and to its products, are perfectly simple and intelligible, that with regard not only to production but to consumption."[18]

What I have just said by no means implies that the first stage of communist society, the cooperative society, is very close to an *ideal* society; I have said nothing about the development of individual talents and abilities, the level of material production, the relative proportion of free time and socially necessary labor time, and the division of labor. In short, I have not assumed that this society is a truly wealthy society in human terms, and it is only such a society which conforms to Marx's understanding of the higher stage of communism. Yet we must not forget that he did assume that the lower stage, the cooperative society, would provide the material preconditions for the further development of man himself and thus enable humanity to move on to a higher stage of society.

The principle "to each according to his work" which Marx advocates for the first stage of socialism is not an egalitarian principle of distribution. Yet it does have the advantage of requiring no radical alteration in human nature; it is not an idealistic or utopian principle, but one directly related to the experience of labor itself; the more you work, the more you make. Marx may very well have thought that what was needed at this stage was a nonexploitative incentive system which would appeal to workers; and that the adoption of a more egalitarian distributive principle would significantly restrict output and prevent the achievement of a sufficient social surplus product for investment in new means of production. The most important problem from the point of view of distribution is not the distribution of the portion of the total social product destined for individual consumption, but the allocation of the total social product itself to different sectors of the economy.

For Marx a crucial factor in economic development is the use of the social surplus product in order to transform the means of production. In the transition from feudalism to industrialism the private extraction, appropriation, and use of the social surplus product in the form of surplus value was absolutely necessary; but Marx argues that the private ownership of the means of production is no longer an efficient method of operating an advanced industrial society. He believed that the collective ownership and operation of the means of production would overcome the inefficiencies of capitalism such as the business cycle, unemployment, poverty, and the like. Despite whatever experience we have had with economic planning in the 20th century, there is no question that Marx thought it would be a more productive and less wasteful economic form than free market capitalism. But Marx also presents a qualitatively different, though related indictment of capitalism — i.e., that it prevents the formation of the social surplus product which could potentially be generated by the efficient operation of an advanced industrial economy.

The theoretical problem of socialist economic development is how to use the enormous increase in the total social product in the most efficient way to promote the goals of socialism. The theoretical weakness of egalitarianism is the inability to confront this basic problem, because distribution is regarded as if it were independent of the mode of production. Assuming that the collective ownership of the means of production and a planned economy creates a relatively affluent society, this society would still suffer from inequalities; egalitarian socialism would create pressure to distribute the social surplus product in the form of subsidies to the relatively inefficient producers. This approach characterizes the type of liberal welfare economics which attempts to combine economic efficiency understood in terms of a high level of material production with social justice by means of taxation and transfer payments. Such a scheme tries to realize the moral ideal of equality with a minimal negative impact on production. As I read him, Marx is claiming that we need to justify a relatively high rate of savings in an affluent socialist society in order to prevent the dispersal of the social surplus product to achieve egalitarianism.

By emphasizing distribution, egalitarian socialism reveals that it is still operating with a very narrow view of consumption, a view more appropriate to a capitalist society and a free market economy. In the *Grundrisse* Marx speaks of the need to acquire a new understanding of wealth and economic efficiency, and this requires a systematic rethinking of the process of production and consumption itself. In classical political economy, consumption was understood primarily in terms of a using

[18] Marx, *Capital*, vol. 1, p. 79.

up and destruction of resources; economic savings occurred by reducing consumption. Marx speaks of " . . . the development of power, of capabilities of production, and hence both of the capabilities as well as the means of consumption." He observes:

> The capability to consume is a condition of consumption, hence its primary means, and this capability is the development of an individual potential, a force of production. The saving of labour time is equal to an increase of free time, i.e. time for the full development of the individual, which in turn reacts back upon the productive power of labour as itself the greatest productive power. From the standpoint of the direct production process it can be regarded as the production of fixed capital, this fixed capital being man himself. . . . Free time — which is both idle time and time for higher activity — has naturally transformed its possessor into a different subject, and he then enters into the direct production process as this different subject. This process is then both discipline, as regards the human being in the process of becoming; and at the same time, practice, experimental science, as regards the human being who has become, in whose head exists the accumulated knowledge of society.[19]

The thrust of Marx's argument is that human beings do not merely consume material goods, they consume life experience itself. The process of material production, labor, is at the same time a process of consumption from the point of view of the laborer, the consumption of the life experience of laboring. Marx thus provides a justification in terms of economic efficiency for the investment of resources in what is now known as human capital.

What Marx is suggesting is that such investment will yield nonmonetary gains, gains which could not be measured according to the criteria developed for evaluating the profitability of investment in a capitalistic society. What is needed is a new criterion for evaluating the economic efficiency of investment of the social surplus product which does not depend upon some form of increase in material production. In the *Critique of the Gotha Program* Marx speaks of overcoming the effects of the division of labor and the development of a sector of the economy which is intended for the common satisfaction of needs. He says, "From the outset this part grows considerably in comparison with the present-day society and it grows in proportion as the new society develops." In effect, what Marx is pointing to is a very significant market failure of capitalist society, the radical underconsumption of life experience itself in the great mass of humanity.

The phrase "from each according to his ability, to each according to his need" assumes that both ability and need have been fully developed. Capitalist society as Marx envisaged it restricts the exercise of human ability and perverts the nature of human needs; only with the appropriation of the total social product by the associated producers is it possible rationally to invest in the transformation of society such that each is fully able and willing to contribute according to his abilities, and to consume according to a human understanding of needs. Only from this perspective, I believe, can we begin to understand what Marx means by the limitations of the first stage of socialism, and why he thinks that we can pass into a higher stage only "after labor has become not only a means of life but life's prime want"; why the necessary condition for this stage is that "the productive forces have also increased with the allround development of the individual."[20] Marx's theory of the development of communist society is not based upon a millennial expectation of the second coming of the dialectic which will transform human consciousness and mysteriously liberate humanity from the curse of economics. Both the limitations and potentials of the first stage of communist society cannot be grasped until we concentrate on the primacy of the means of production, and come to see consumption and distribution as a consequence of the mode of production. This was Marx's method for understanding society, and I submit that it is also a good method for understanding Marx. We have become very sensitive to the philosophical problems embedded in Marx's economic concepts, but it might be time to reverse the trend and once again attempt to see economic problems behind Marx's philosophical speculations.

Explaining Party Cohesion in Congress: The Case of Shared Policy Attitudes*

HELMUT NORPOTH
University of Cologne, Germany

Contrary to the chronic laments of the "responsible parties" advocates and their contemporary apostles,[1] it is generally "party" which in one way or another emerges as a force without rival in legislative decision making in Congress.[2] Roll-call votes typically reveal splits along party lines, even though few if any floor votes pit just about all members of one party against all members of the other party.[3]

"Party," nevertheless, has remained an elusive concept in the American legislative context, for there is little party organization, whether within Congress or without, which would seem capable of molding the voting decision of the individual congressman. The elected party leaders, for example, are not credited by most observers with much direct influence on decisions of their party colleagues.[4] Sanctions against deviance from the party line lack the force of deterrence. Yet the imprint of party on legislative decisions remains visible.

The apparent lack of party discipline has prompted some analysts to suggest that "party" is only a shorthand for "constituency." Members of the same party are said to vote together because they come from the same kinds of local districts and respond alike to the same

* This article is adapted from the author's doctoral dissertation, "Sources of Party Cohesion in the U.S. House of Representatives" (The University of Michigan, Ann Arbor, 1974). Acknowledgements are due Gudmund R. Iversen, Warren E. Miller, Donald E. Stokes and Herbert F. Weisberg for comments on the dissertation. I am also grateful to Russ Dalton and Lanny Dodd for encouraging advice. The data used in this analysis were originally collected by Warren E. Miller and Donald E. Stokes, and were made available by the Inter-University Consortium for Political Research, Ann Arbor, Michigan.

[1] See David S. Broder, *The Party's Over* (New York: Harper and Row, 1972) as well as the classic report of the APSA, *Toward a More Responsible Two-Party System*, Report of the Committee on Political Parties (New York: Rinehart, 1950).

[2] See Julius Turner, *Party and Constituency* (Baltimore: The Johns Hopkins Press, 1951); Julius Turner and Edward V. Schneier, Jr., *Party and Constituency*, revised edition (Baltimore: The Johns Hopkins Press, 1970); David B. Truman, *The Congressional Party* (New York: Wiley, 1959); Donald R. Matthews, *U.S. Senators and their World* (New York: Random House, Vintage Books, 1960); Gerald Marwell, "Party, Region and Dimensions of Conflict in the House of Representatives, 1949–1954," *American Political Science Review*, 61 (June, 1967), 390–399; Michael J. Sapira, "The House and the Federal Role: A Computer Simulation of Roll Call Voting," *American Political Science Review*, 62 (June, 1968), 494–517; and Cleo Cherryholmes and Michael J. Shapiro, *Representatives and Roll Calls* (New York: Bobbs Merrill, 1969). The work by Cherryholmes and Shapiro comes closest to an assessment of party within the full context of legislative behavior. For an extensive review of the literature on party voting, see W. Wayne Shannon, *Constituency and Congressional Voting* (Baton Rouge: Louisiana State University Press, 1968), pp. 3–63.

[3] In purely descriptive terms, the role of party in roll call voting has gradually declined. In 1921, nearly one of every three roll calls showed a split in which more than 90 per cent of the members of one party opposed more than 90 per cent of the members of the other party. In 1967, barely three of every hundred roll calls met that standard. See Turner and Schneier, *Party and Constituency*, p. 17. Even while this secular decline was under way, it was common for a congressional session up until the mid 1960s to witness a majority of Democrats oppose a majority of Republicans on most roll calls. During every session from 1966 until 1970, however, only a third of the roll-call votes fitted that description. See Frank J. Sorauf, *Party Politics in America*, 2nd ed. (Boston: Little, Brown and Co., 1972), p. 351. However intriguing these symptoms may be, hinting at both a long-term as well as an accelerated recent decline of the party factor in roll-call voting, they lie outside the scope of this analysis.

[4] See Truman, *The Congressional Party*, pp. 203–226; Matthews, *U.S. Senators*, pp. 123–129; and John E. Jackson, "Statistical Models of Senate Roll-Call Voting," *American Political Science Review*, 65 (June, 1971), 451–470. Some of the conditions under which party leadership may affect the voting decisions of representatives are examined by Lewis A. Froman, Jr. and Randall B. Ripley, "Conditions for Party Leadership: The Case of House Democrats," *American Political Science Review*, 59 (March, 1965), 52–63. For a more extended discussion of the activities, organization, and influence of party leadership, see Randall B. Ripley, *Party Leaders in the House of Representatives* (Washington, D.C.: The Brookings Institution, 1967). For a look at the Senate, see Ralph K. Huitt, "Democratic Party Leadership in the Senate," *American Political Science Review*, 55 (March, 1961), 331–344. Unlike the U.S. Congress, state legislatures have been found to be more heavily dominated by the party leadership. See, for example, Susan Welch and Eric H. Carlson, "The Impact of Party on Voting Behavior in a Non-partisan Legislature," *American Political Science Review*, 67 (September, 1973), 854–867. Also see Sarah McCally Morehouse, "The State Political Party and the Policy-Making Process," *American Political Science Review*, 67 (March, 1973), 55–72. Morehouse argues that the governor, through the control of the party's nominating organization, brings about party cohesion.

kinds of pressures.[5] But in analyses based on this contention, "party" never dissolves quite so neatly into the constituency components. And even if it did, the question of what made congressmen vote along party lines would only be shifted to another level, for "constituency" can have a variety of meanings and exert influence through a variety of mechanisms.[6]

Conceptually, the alternative to cohesion based on discipline is cohesion based on shared policy goals.[7] That is to say, members of a given party vote alike because they tend to agree on policy and not because they fear sanctions or expect favors. Such policy agreements would largely result from the way in which candidates are selected, whether through careful screening by party officials, supporting coalitions and primary voters or through self-selection of candidates along ideological lines. Regardless of the specific selection mechanism, representatives of a given party would face legislative issues with a similar outlook on policy which would distinguish them from members of the other party (or parties).

It is the purpose of this study to examine the impact of shared policy attitudes on legislative decision making. The central hypothesis states that party cohesion, i.e., the extent to which parties vote in unison, is rooted in shared policy attitudes. The empirical analysis of this hypothesis which follows attempts to do the following:

1) assess the degree to which House representatives differ by party in their attitudes towards important political issues.
2) compare, within a given domain of policy, the attitude locations of the parties with their respective locations during roll call voting, and determine the closeness of fit between a party's attitude and its roll-call record.
3) develop a special statistical model designed to measure the relative impact of shared attitudes vs. individual attitudes on roll-call voting.
4) briefly explore the process through which shared attitudes become translated into votes along party lines. Special attention is paid in this part to key representatives whose advice is highly valued by their House colleagues.

Theoretical and Methodological Overview

Party cohesion in legislative voting is hypothesized to be rooted in policy attitudes shared by members belonging to the same party. Matthews has suggested this explanation of party cohesion in his study of Senate voting,[8] and others have attempted to explain in this way the cohesion of British and Canadian Parliamentary Parties.[9] The reformatory party government literature postulated a unified programmatic orientation as one way to achieve more cohesive legislative parties in the future.[10]

That representatives share policy orientations sounds plausible; so plausible, in fact, that few observers have bothered to measure the extent of such sharing.[11] Kingdon's study of congressional candidates' beliefs and strategies is a welcome exception. His findings demonstrate sharp contrasts in the issue appeals that Democrats and Republicans offer the electorate: hardly any Democratic candidate

[5] This view is best expressed by Lewis A. Froman, Jr., *Congressmen and Their Constituencies* (Chicago: Rand McNally 1963), p. 89. Like his study, most of the other studies devoted to this relationship rely on the demography of the congressional district in their attempt to measure the presumed influence of the local constituency. Besides Froman, pp. 92–96, see Turner and Schneier, *Party and Constituency*, pp. 222–225; also Thomas A. Flinn, "Party Responsibility in the States: Some Causal Factors," *American Political Science Review*, 58 (March, 1964), 60–72; Duncan MacRae, Jr., "The Relationship Between Roll Call Votes and the Constituencies in the Massachusetts House of Representatives," *American Political Science Review*, 46 (December, 1952), 1046–1055; and David R. Mayhew, *Party Loyalty Among Congressmen* (Cambridge: Harvard University Press, 1966).

[6] For the development of complex linkages between the local constituency and legislative decision making, see, above all, the pioneering study by Warren E. Miller and Donald E. Stokes, "Constituency Influence in Congress," *American Political Science Review*, 57 (March, 1963), 45–56; also Raymond A. Bauer, Ithiel de Sola Pool, and Lewis A. Dexter, *American Business and Public Policy* (New York: Atherton Press, 1963); and John W. Kingdon, *Candidates for Office* (New York: Random House, 1968).

[8] See Matthews, *U.S. Senators*, p. 133.

[9] See Leon D. Epstein, "Cohesion of British Parliamentary Parties," *American Political Science Review*, 50 (June, 1956), 360–377; also Allan Kornberg, "Caucus and Cohesion in Canadian Parliamentary Parties," *American Political Science Review*, 60 (March, 1966), 89. For a recent probe of party differences in policy attitudes in the British House of Commons, see Allan Kornberg and Robert C. Frasure, "Policy Differences in British Parliamentary Parties," *American Political Science Review*, 65 (September, 1971), 694–703.

[10] See the APSA report, *Toward a More Responsible Two-Party System*.

[11] The studies of McClosky *et al.* cover a somewhat wider spectrum of party activists. See Herbert McClosky, Paul Hoffman and Rosemary O'Hara, "Issue Conflict and Consensus Among Party Leaders and Followers," *American Political Science Review*, 54 (June, 1960), 406–427.

had conservative issue appeals, and hardly any Republicans had liberal ones.[12]

These issue appeals are more than fleeting campaign promises, for they are firmly rooted in the supporting coalitions of candidates: "Not a single Democrat in this study perceived his supporting coalition as including business and professional groups but not labor, and not a single Republican listed a coalition which included organized labor but not business and professional people."[13] Unless such perceptions are pure fantasies, the two parties — outside the South — rest on different socio-structural foundations.[14] A certain social support goes hand in hand with a certain issue orientation, and both of them square with a certain party affiliation. Representatives of a given party can reasonably be expected to face the legislative workload with a basically similar outlook on policy matters.

Maintaining that candidates of a given party share policy attitudes, however, is not the same as saying that representatives are affected in their voting decisions by such shared policy attitudes. How much influence are attitudes likely to exert on behavior in the institutional context of the legislative world?[15] Attitudes covering a range of political issues would seem to help a representative respond consistently to the variety of legislative bills that he must face, shortening considerably his decision time. Policy attitudes, in fact, have been found to correlate fairly strongly with roll-call voting in a number of policy areas.[16] Such zero-order correlations at the very least establish the fact that representatives vote largely in accordance with their policy attitudes. That much seems beyond dispute.

The hypothesis, however, that attitudes — even those with a fairly specific policy reference — exert a direct influence on legislative voting has met with strong criticism.[17] The legislative scene, it is argued, confronts the individual representative with a workload of immense volume and complexity. He is faced with sheer insurmountable problems of information gathering and processing. These problems are presumed to curtail severely the influence that a representative's attitude may exert on his voting decisions. The way he handles these problems, it is suggested, is by specialization, on the one hand, and reliance on the judgment of trusted colleagues, on the other. The division of labor embodied in the committee system encourages such specialization and generates voting cues in situations where a legislator is unfamiliar with the subject matter of a given bill. In selecting a source of information and advice on such bills, most congressmen are said to turn to members of committees which have dealt with those bills.[18] In and through committees legislative proposals receive the precise and detailed shape in which they reach the ordinary legislator on the House floor.

I have no quarrel with this view but, at the same time, would not necessarily deduce from it the irrelevance of attitudes to legislative decision making. To be sure, on bills pertaining to his domain of specialization a committee member enjoys a prominent position, but not every member of that committee is equally attractive to every House colleague outside the committee. Congressmen have been found to be much better acquainted with members of their own party than with those of the other party, and this preference extends to consultation on important policy matters as well.[19] This pattern of choice, I contend, greatly contributes

[12] See Kingdon, *Candidates for Office*, pp. 122–123.

[13] *Ibid.*, p. 144.

[14] *Ibid.*, pp. 55–66; Kingdon strongly argues that these ties do not imply control. The representative is not "owned" by the coalition supporting him nor does he feel he owes it any favors. Instead, he shares from the outset the policy goals of those groups.

[15] The literature on the notion, definition, and impact of attitudes is vast. See, for example, Daniel Katz and Ezra Stotland, "A Preliminary Statement to a Theory of Attitude Structure and Change," in *Psychology: A Study of Science*, vol. 3, ed. Sigmund Koch (New York: McGraw-Hill, 1959), pp. 424–465. For a discussion of the role of attitudes in the realm of political behavior, see Fred I. Greenstein, *Personality and Politics* (Chicago: Markham Publishing Company, 1969).

[16] See Miller and Stokes, "Constituency Influence;" also John L. Sullivan and Robert E. O'Connor, "Electoral Choice and Popular Control of Public Policy: The Case of the 1966 House Elections," *American Political Science Review*, 66 (December, 1972), 1256–1268.

[17] That a representative's predisposition cannot have a strong effect on his voting decisions is strongly argued by Arthur H. Miller in his doctoral dissertation, "The Impact of Committees on the Structure of Issues and Voting Coalitions: The U.S. House of Representatives, 1955–1962" (The University of Michigan, Ann Arbor, 1971), p. 6.

[18] See the vivid testimony cited by Arthur G. Stevens in his dissertation, "Informal Groups and Decision-making in the U.S. House of Representatives" (The University of Michigan, Ann Arbor, 1970), pp. 54–59; also see Charles L. Clapp, *The Congressman: His Work and as He Sees It* (Washington, D.C., The Brookings Institution, 1963), pp. 149, 292. A more rigorous assessment of this relationship is presented by Miller, "Impact of Committees," pp. 158–208.

[19] See Clapp, *The Congressman*, pp. 14–17. Also consult John W. Kingdon, *Congressmen's Voting Decisions* (New York: Harper and Row, 1973), p. 78.

o the effect of shared policy attitudes on legisative voting.

The hypothesized effect is largely indirect. hared policy attitudes are regarded as the asis for choosing certain informants from the anks of one's own party. These informants hen act in their own sphere of specialization n the basis of shared policy attitudes. The verage House member, in turn, following the ue of his informant, casts a partisan vote hich bears the imprint of shared policy attiudes. This, in very condensed form, is the hypothesized linkage between shared policy attitudes and party voting to be examined in this nalysis.

The data for this analysis came from the Representation Study conducted by Miller and Stokes in 1958–59.[20] This complex set of data includes interviews with about one third of the members of the 85th and 86th Congress (1957–60). The sample of congressmen was drawn from congressional districts located within the sampling frame of the mass election surveys conducted by the Michigan Survey Research Center in 1956. For every incumbent included in this sample, his nonincumbent challenger in the 1958 congressional election was also interviewed, provided the incumbent was challenged. The combined sample consists of 251 individuals.

This data set was chosen because of the invaluable information it contains on the policy attitudes of congressmen, the key concept of this enterprise. Such attitudes were ascertained for three classical dimensions of partisan conflict, namely the federal government's involvement in "social welfare," its involvement to protect "Negro civil rights," and the United States' role in "world affairs."[21] These dimensions were salient not only during the 1950s but even more so — with Johnson's Great Society Program, voting rights legislation and the escalation of the Vietnam War — during the 1960s. To be sure, the composition of Congress has greatly changed since 1960 and with it perhaps the importance of the concepts examined here. Short of a retest with data on a recent Congress, the findings reported below merely suggest rather than establish the pattern of party voting in the present-day House of Representatives.

In the analysis which follows, southern Democrats are treated as a separate partisan group.[22] This step, I believe, is strongly justified by the amply documented split between southern and nonsouthern Democrats in Congress not only over racial issues but issues of foreign policy and economic and social policy as well.[23]

Shared Policy Attitudes

The first step in the analysis involves a look at the extent of attitudinal cohesion among representatives of the three party groups. The shared policy attitudes have been estimated by the arithmetic mean of scale items endorsed by members of the same party group. In order to assess the extent to which these attitudes are shared within the three party groups, I rely on eta^2, the correlation ratio.[24]

The attitude positions of the three party groups emerge with clear and statistically significant distinction in all three domains, as revealed by Figure 1. In the domain of foreign policy, nonsouthern Democrats take the most internationalist position while their southern colleagues prove to be most isolationist. The

[20] Two files, made available by the Inter-University Consortium for Political Research (I.C.P.R.), contain the data used for this analysis: *The Representation Study: The Candidate File*, 1970, and *Candidates and Constituents*, 1971, Ann Arbor, Michigan.

[21] Within the domain of "social welfare," the issues include public housing, full employment, aid to education, and the federal development of atomic energy. The "civil rights" items refer to Negro voting rights, the establishment of a Fair Employment Practices Commission, and school desegregation. The "foreign policy" issues include foreign economic aid, foreign military aid, aid to neutral countries, and the general theme of isolationism vs. involvement abroad. For a wording of the questions, see I.C.P.R., *The Candidate File*, pp. 28–43. The items within each of the three policy domains have been combined into Guttman scales, and these scales are used whenever policy attitudes are examined in this analysis. For details of the scale construction, see I.C.P.R., *The Candidate File*, pp. 219–222.

[22] The South is considered to include the eleven states of the former Confederacy plus the four border states of Maryland, Kentucky, Oklahoma, and West Virginia.

[23] For such evidence, see Turner and Schneier, *Party and Constituency*, pp. 171–179; also Truman, *The Congressional Party*, p. 149; H. Douglas Price, "Are Southern Democrats Different? An Application of Scale Analysis to Senate Voting Patterns," in *Politics and Social Life*, ed. Nelson W. Polsby, R. A. Dentler, and P. A. Smith (Boston: Houghton, Mifflin Co., 1963), p. 755; and Shannon, *Constituency*, pp. 81–94. The early development of the Republican-Dixiecrat coalition is traced by V. O. Key, Jr., *Southern Politics* (New York: Vintage Books, 1949).

[24] Since the data are weighted, the significance of the differences was tested by relying on the unweighted N for finding the degrees of freedom in the F-table. For information on the assignment of weights, consult I.C.P.R., *The Representation Study: The Candidate File*. With a random sample of about 120 observations and three groups, any value of eta^2 exceeding .06 (eta = .25) is significant at the .05 level. For a detailed presentation of eta^2, see Linton C. Freeman, *Elementary Applied Statistics* (New York: John Wiley & Sons, Inc., 1965), pp. 120–130, 199–209.

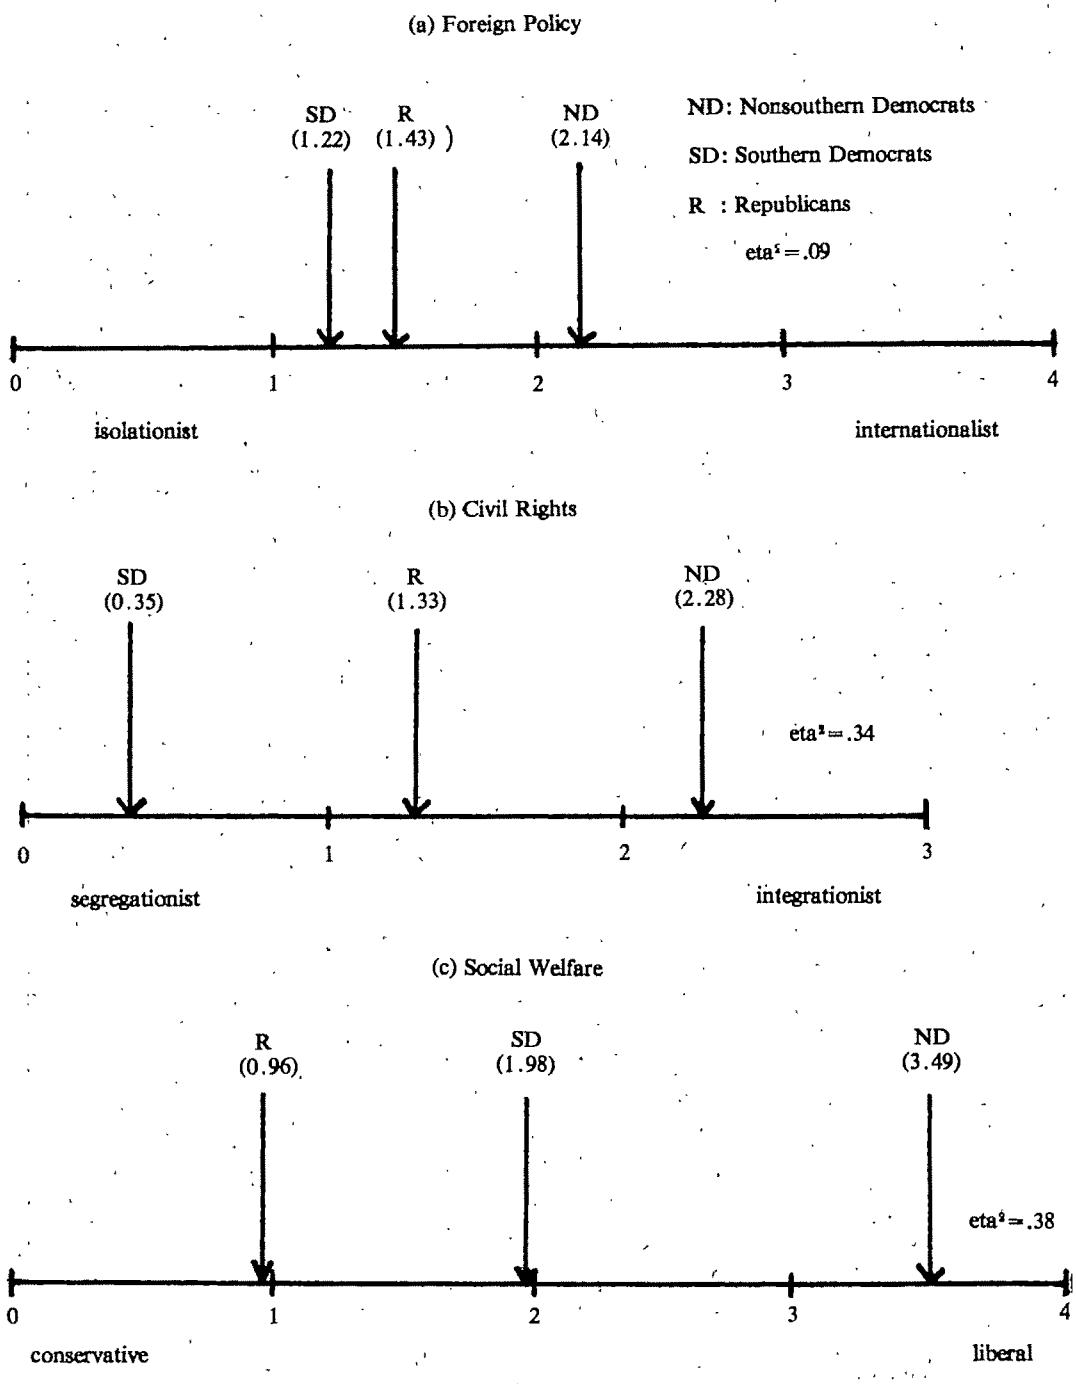

Figure 1. Attitude Locations of House Representatives by Party in Three Policy Domains.

Republicans, located between the two Democratic groups, take a position which is closer to the isolationist than to the internationalist end of this scale. This pattern also holds consistently for each particular item composing the foreign policy scale except for the item involving military aid. On this issue, nonsouthern Democrats proved less internationalist, i.e., less generous with military aid, than did the other two party groups. On the whole, the differences in this domain, while significant, are small. None of the three party groups is, by its attitude, closely identified with a specific course in foreign policy. One would not expect a high level of voting cohesion against this backdrop of attitude differences.

In the civil rights domain, the distinctions between the three party groups are far more impressive. With the gulf separating the two Democratic groups turning out as vast as expected, one may pause to note the distinctive position with which Republicans emerge in this domain. Representatives of the party of Lincoln and the abolition of slavery approve integration far less wholeheartedly than do Democrats outside the South. The roots are planted for an occasional coalition between Republicans and southern Democrats even in this domain.

The social welfare domain most sharply reveals differences in party attitudes. Republicans and Democrats from outside the South confront each other from opposite ends of the social welfare continuum. While southern Democrats take a position in the middle of it they are slightly closer to the Republicans. On the whole, the attitudes of southern Democrats have proved more compatible with those of Republicans than with those of their own party colleagues outside the South. The so-called "conservative coalition" in House voting has a firm root in the policy attitudes of the partisan groups forming it.

The reliance on the arithmetic mean in portraying the attitudinal locations of the parties may invite some questions and criticism. One might ask whether or not these means indicate positions which are shared by a majority of party colleagues in the House. A party polarized over a given issue may be characterized by a mean position which has few if any occupants. Likewise, a few colleagues located at one extreme of a scale may unduly shift the mean of the whole group away from the point where most of the members are found.

As Table 1 demonstrates, the mean party position in most instances points closely to the scale portion where a majority of members of any party group — often an overwhelming majority — happens to be located. Only two exceptions need to be noted: Southern Democrats in the social welfare and Republicans in the civil rights domain. Their mean values of 1.98 and 1.33, respectively, identify thinly populated scale areas. Southern Democrats are divided on social welfare issues into two wings, the larger one finding a comfortable alliance with Republicans and the smaller making a congenial partner for nonsouthern Democrats. Republicans exhibit a similar split over civil rights issues, with one wing sharing the southern and the other one sharing the nonsouthern position of the two Democratic groups.

The discussion of shared attitudes thus far has focused on representatives who have served in Congress. Their policy attitudes have been ascertained at a certain moment of their political careers. It is conceivable that their atti-

Table 1. Percentage of House Representatives Sharing the Mean Attitude of their Party Group by Issue Domain[a]

Party Group	Foreign Policy	Civil Rights	Social Welfare	(Weighted N)[b]
Nonsouthern Democrats	54.5 (2,3)	78.6 (2,3)	83.4 (3,4)	(204)
Southern Democrats	60.2 (1,2)	88.9 (0,1)	36.5 (1,2)	(232)
Republicans	51.0 (1,2)	29.9 (1,2)	78.7 (0,1)	(280)

[a] The pair of adjacent scale positions surrounding the partisan mean is given in parentheses below the percentage figures.

[b] The unweighted N includes 42 nonsouthern Democrats, 34 southern Democrats, and 52 Republicans.

tudes have changed, in a systematic way, as the result of age or legislative experience since entering Congress. The data at hand are too limited for a full examination of this question. But what can be investigated is the fit between the party attitudes of incumbents and those of candidates aspiring to the office of congressman. Should their attitudinal locations match closely, the party attitudes of representatives would seem unaffected by congressional experience and could be regarded as widely shared partisan goals.

In Figure 2 the attitude locations of incumbents face those of nonincumbent candidates in the three policy domains. It may appear that the Republican as well as the southern Democratic nonincumbents are taking, in all three domains, far more "contemporary" positions than do their incumbent party colleagues — "contemporary" referring to internationalist, integrationist, and liberal, respectively. But these differences seldom reach statistical significance (only among Republicans in the social welfare and among southern Democrats in the foreign policy domain). And nonsouthern Democrats reveal differences which are neither striking nor significant. Thus the mean party attitudes of representatives, on the whole, seem very little influenced by the legislative setting. Instead these attitudes hint at a platform also shared by fellow partisans outside Congress, at least by those who pass the hurdle of party nomination. In one way or another, then, the differences in policy attitudes found among representatives can be traced to the selection of candidates for congressional office. Each of the three party groups manages to recruit candidates whose policy outlook fits the partisan mold.

Party Positions: Attitudes vs. Voting

Shared policy attitudes, so runs the hypothesis of this paper, are supposed to leave a major imprint on the voting decisions of representatives. One way to test this proposition is by comparing the roll-call positions of the parties with their attitudinal positions.[25] A test of this sort requires comparable scales of attitude and behavior; not only must the domain of policy be equivalent in both instances, but the measured scores must be comparable as well — a condition achieved here by the use of standardized scores, expressing both attitudinal and roll-call scores as standard deviations from their respective means.

The standardized mean positions are displayed in Figure 3 for incumbents of the three party groups. In all three domains, the rank order of attitudinal positions is the same as the rank order of roll-call positions. That is to say that a party group which professes more liberal attitudes than another one also votes more liberally than the other one. Of course, with only three objects to be ranked, such an agreement in rankings can easily occur by chance alone. But to encounter it in three domains is not so easily done by chance, the probability being less than .005.[26] As a result, the finding that the three parties considered here have the same rank in both attitude and voting in three domains is not at all trivial.

Figure 3, moreover, reveals the goodness of fit between a party's attitude and its roll-call position, with the match between the two being closest in the social welfare domain. The impression conveyed by the configuration in that domain suggests that representatives, on the whole, vote in strict accordance with their party's attitude. Such a result squares nicely with the finding of a sharp attitudinal cleavage between the parties in this domain.

In the foreign policy domain, however, the parties' vote positions do not match as closely their attitudinal locations. In fact, among Republicans, whose behavior suggests perfect harmony between attitude and voting, the match is worst. The party is sharply split over foreign policy roll calls, with one wing — Republicans from coastal states — acting very much like nonsouthern Democrats, while the opposite wing — Republicans from interior states — shares the isolationist position taken by south-

[25] For each of the three policy domains, the data set of the Representation Study contains Guttman scales of roll-call votes, one scale for the 85th Congress and another one for the 86th. The social welfare scale for the 85th Congress is made up of items referring to public housing, aid to education, area development, and appropriations for various agencies of the Departments of Labor and Health, Education and Welfare. The items of the foreign policy scale (85th Congress) include a variety of foreign aid votes. And the civil rights scale (85th Congress) consists of items dealing with the Civil Rights Act of 1957. For a more detailed reference to the titles of the bills and a description of the scale construction, see I.C.P.R., *The Candidate File*, pp. 226–229. For the roll-call scales pertaining to the 86th Congress, see I.C.P.R., *Candidates and Constituents*, pp. 619-624.

[26] Three objects can be ranked six different ways, and each ranking can form a pair with any other one of the six, including itself. This results in 36 pairs of such rankings, six of which are in agreement. Thus the probability of independently ranking three objects the same way twice is 6/36 or .167. The probability of obtaining such a result in three different domains independently, therefore, is $(.167)^3$ or .0046.

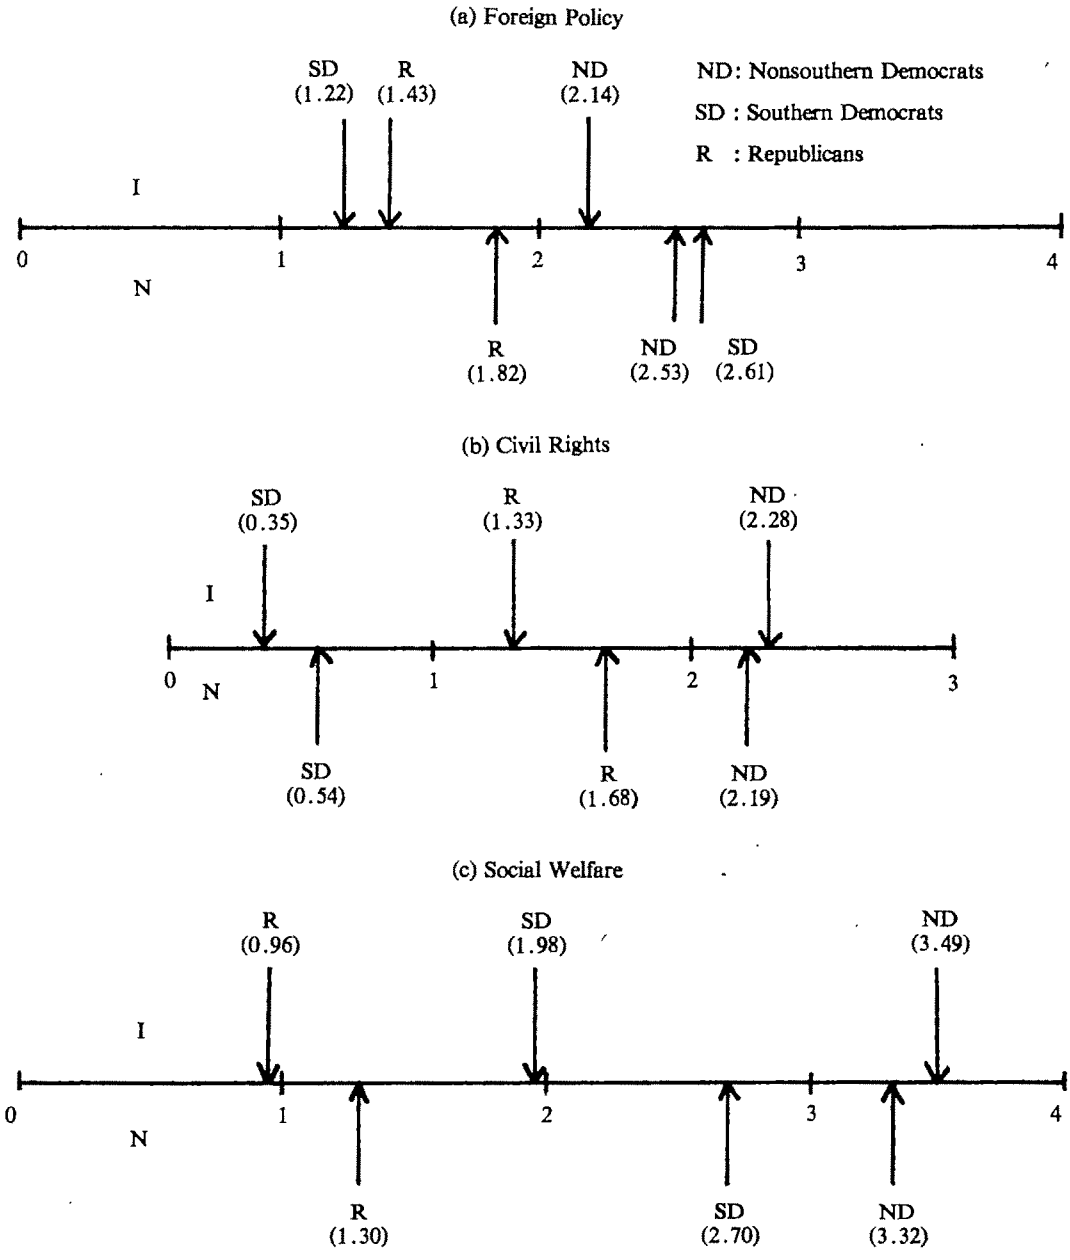

Figure 2. Attitude Locations of House Incumbents (I) and Nonincumbent Candidates (N) by Party in Three Policy Domains

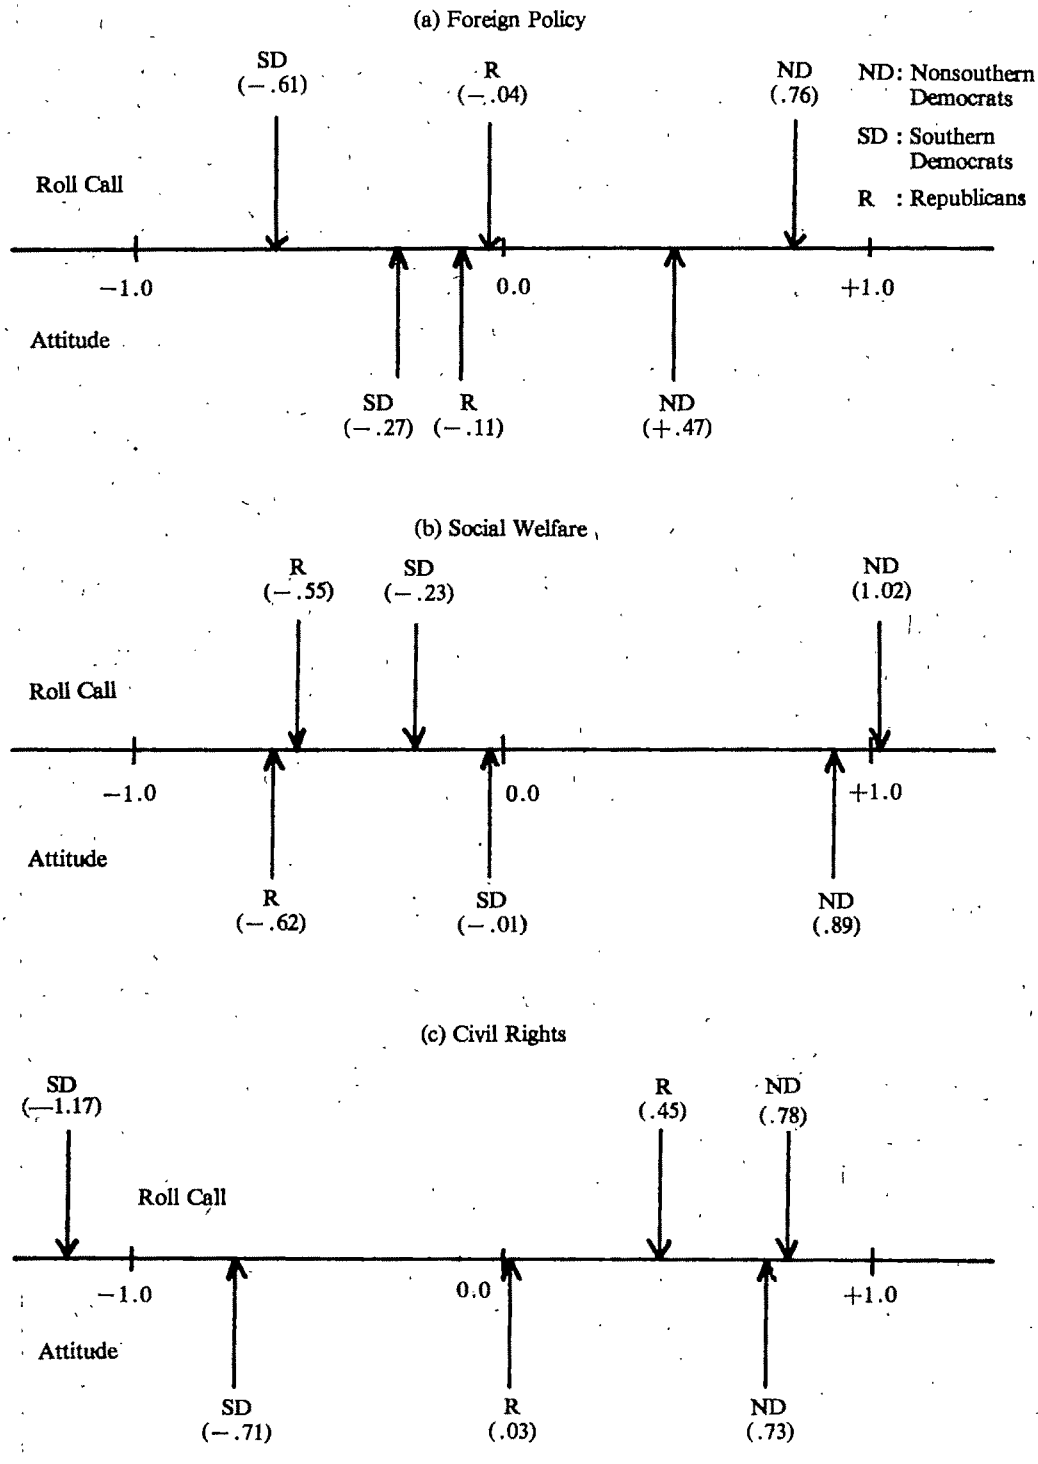

Figure 3. Roll-Call and Attitude Positions of Party Groups in the House of Representatives (Standardized Means)

ern Democrats. The less than perfect overlap between attitudes and voting positions accomplished by the party groups in the foreign policy domain is closely tied to the feeble distinction of foreign policy attitudes noted above.

The civil rights configuration also reveals some discrepancies between the voting positions of the parties and their attitude locations. Southern Democrats shift to an even more segregationist position than their shared attitude would suggest, and Republicans pay a heavier tribute to their historical legacy in racial policy than their shared attitude would have led one to expect. In this domain party attitudes differed noticeably — although not as much as in the social welfare domain; but their ability to generate corresponding voting positions is somewhat weaker by comparison.

The slippage between attitude and voting in this domain might be explained by constituency influence. On civil rights issues, representatives have been shown to be closely attuned to the opinion of their local constituencies.[27] It is very likely, therefore, that southern Democrats are acting on perceptions, which are widely shared within this group, that their constituencies demand a far more restrictive policy in this domain than they would offer themselves; likewise, Republicans are moved by shared perceptions of their constituencies to stronger action than their own attitudes would demand.

Despite some noted slippage between attitude and voting, a certain pattern emerges quite visibly. In all three domains the two party groups which stand closest to one another on the attitude continuum also turn out closest in roll-call voting. Thus voting coalitions observed in floor decision making mirror the attitudinal configurations of the party groups. Even though the focus on mean positions has obscured sizeable individual shifts as well as wholesale moves by some intraparty wings, these mean values hint at the approximate locations of most members of the respective party groups.

Measuring the Effect of Party Attitude on Individual Behavior: The Statistical Model

The analysis so far has established that the three party groups differ substantially in their attitudes toward controversial matters of policy, although not equally so in all policy domains, and that the shared attitude of a party group points to its position taken during roll-call voting, although again in one domain more closely than in another one. But since none of the party groups, save nonsouthern Democrats in one instance,[28] achieve unanimity in either attitudes or voting, individual variation from respective party positions waits to be taken into account. Such individual variation may severely curtail the role of party in the event that attitudes and voting positions prove highly correlated among individuals within party groups, or it may simply introduce some random "noise" surrounding the well separated party positions. In order to shed some light on this question, I propose a statistical model aimed at simultaneously estimating the effects of individual attitude and partisan attitude on individual roll-call behavior.[29] That is to say, the effect of shared policy attitudes is to be assessed in the presence of individual deviations from those shared attitudes.

The hypothetical situation of a pure group (party) effect is displayed in Figure 4. The roll-call positions of members of three groups have been plotted against their attitudinal positions. The groups are ranked the same way on both the attitude and the roll-call axis. Within each of the groups, however, an individual's attitude fails to be linearly related to his vote, a condition which is indicated by the zero slope found within each group. In other words, the group molds the behavior of the individual who belongs to it. However much an individual's attitude deviates from the group voting standard, such deviations are randomly distributed instead of being systematically related to an individual's policy attitude. This model has been labeled "model of group effect only." By drawing a single line with a positive slope through the three clusters of points, one could still visualize an overall

[27] The importance of a congressman's perception of constituency opinion in the civil rights domain is emphasized by Miller and Stokes, "Constituency Influence."

[28] The zero variance displayed by nonsouthern Democrats in roll-call voting on civil rights bills is rather exceptional and is not duplicated in the subsequent Congress (86th). But the lack of any variance shown by the data for the 85th Congress is not the result of sampling oddities. The sample mean of 6.0 lies well within the neighborhood of the population mean of all nonsouthern Democrats, amounting to 5.9 with a standard deviation of 0.62.

[29] The basic ideas for this model have emerged from a great deal of communication betwen the author, Gudmund Iversen, and Lawrence Boyd. See Gudmund R. Iversen, "Recovering Individual Data in the Presence of Group and Individual Effects," *American Journal of Sociology*, 79 (September, 1973), 420–434, as well as Lawrence Boyd's doctoral dissertation, "Multiple Level Analysis With Complete and Incomplete Data" (The University of Michigan, Ann Arbor, 1971). Both authors also provide an extensive bibliography of the literature on group, structural, and contextual effects.

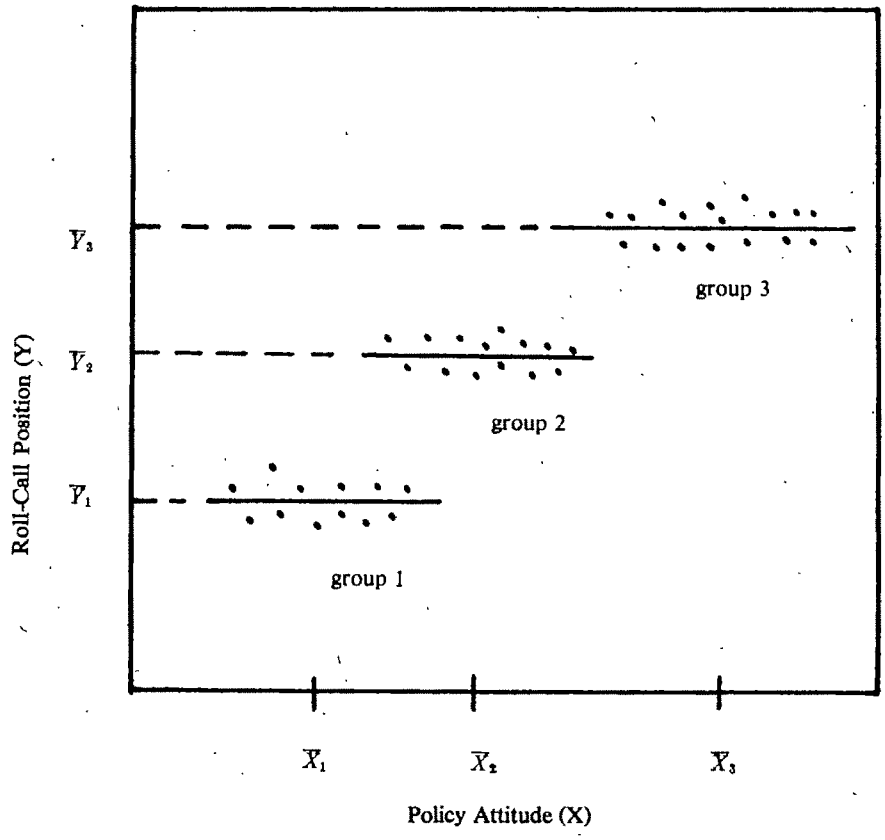

Figure 4. A Model of Group Effect Only

relationship between an individual's attitude and his voting, but that slope would vanish once the group positions are held constant.

As an alternative consider a model which, in addition to the group effect, also recognizes an individual effect (e.g., the representative's own attitude). Such a model would obtain when the slopes of the within-group relationship were allowed to become non-zero, while the group means remain different and in the same rank-order on both axes. An example of such a model is depicted in Figure 5. It should be noted that all the within-group slopes are listed as equal, a condition which indicates that the same relationship between attitude and voting holds for each group.

But such a pattern is just a special case within the class of "models combining a group effect with an individual effect." Another special case of that class worth noting arises when the within-group slopes vary systematically with the group positions. One might suppose that the higher the group position on X is, the steeper the slope is going to be for that group. The possibility of such "interaction" between the individual position on X and the group position on X, which need not be positive, has been included here along with individual and group effects taken separately.

In order to develop the equation representing this complex model, let us designate the voting position of individual j in group i as Y_{ij}, his attitudinal position as X_{ij}, the intercept and the slope of the linear relationship between X and Y within his group as a_i and b_i respectively, and the random disturbance associated with his voting position as e_{ij}. The basic relationship between an individual's attitude and his vote can then be represented by

$$(1)\quad Y_{ij} = a_i + b_i(X_{ij} - \bar{X}_i) + e_{ij} \qquad (i = 1,2, \cdots, k) \qquad (j = 1,2, \cdots, n_i)$$

Expression (1) defines the parameters of the within-group relationship, one set of a and b coefficients for each group of individuals. By measuring the individual predictor X_{ij}, as de-

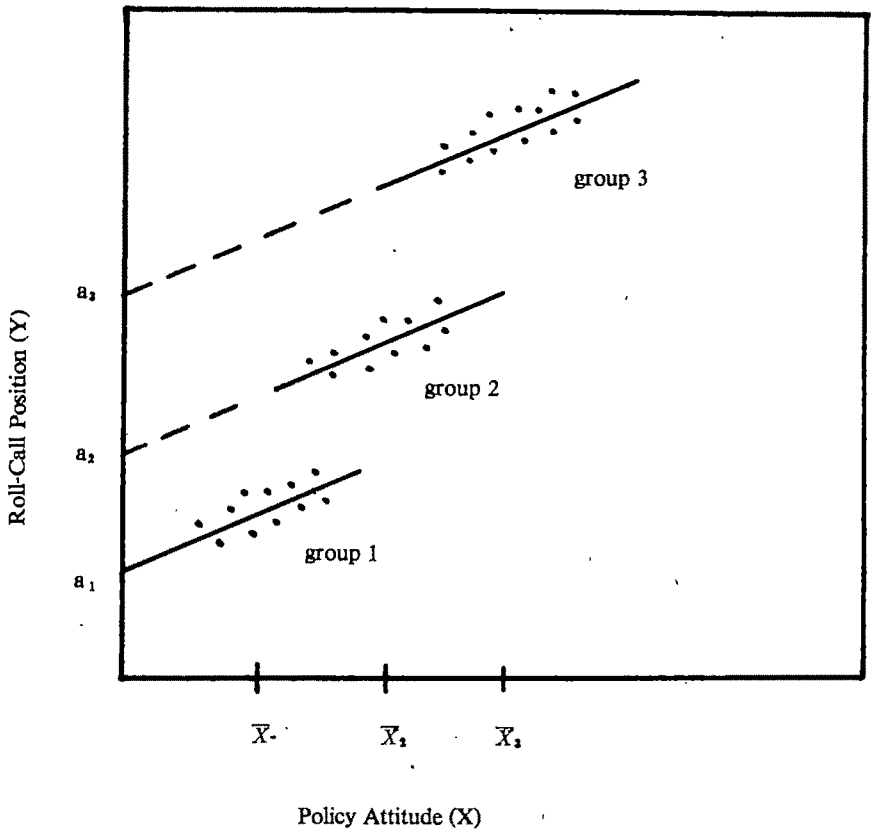

Figure 5. A Model Combining Group and Individual Effects

viation from the group mean $\overline{X}_i$, the model guarantees the independence between the individual and the group variable. Unless eliminated, the substantial overlap between the two variables would jeopardize the estimation of their coefficients.

In order to introduce the "group effect," let us postulate a linear relationship between group means on X and Y (with the disturbance term omitted for sake of simplicity):

$$(2)\quad \overline{Y}_i = A_0 + A\overline{X}_i \quad (i = 1,2, \cdots, k)$$

Such a linear relationship between group attitude ($\overline{X}_i$) and group voting position ($\overline{Y}_i$) was suggested by the display of locations in Figure 3. Note that the coefficients in (2) have been capitalized in order to distinguish them for the individual level coefficients in (1). By taking group averages on both sides of equation (1) one obtains another expression for $\overline{Y}_i$, namely:

$$(3)\quad \overline{Y}_i = a_i$$

By combining (2) with (3) one finds that

$$(4)\quad a_i = A_0 + A\overline{X}_i$$

A link has now been established between the individual model and the group model of the relationship between X and Y. The intercepts of the individual (within-group) relationship a_i have been expressed as a function of the group means on X. Going one step further and entering (4) into (1) leads to:

$$(5)\quad Y_{ij} = A_0 + A\overline{X}_i + b_i(X_{ij} - \overline{X}_i)$$

Thus, both the group and the individual effects are now included in one model, the two effects being independent of each other. Expression (5) still provides for a separate individual effect b_i for each group. In the event that this effect can be considered equal for all groups, it can be replaced by a constant b. If, on the other hand, this effect is supposed to vary systematically with the group means on X, b_i ought to be replaced by a linear function. This kind of variation, which is denoted as "interaction," is captured by (6), the disturbance term having been omitted:

$$(6)\quad b_i = B_0 + B(\overline{X}_i - \overline{X}) \quad (i=1,2, \cdots, k)$$

B_0 denotes that part of the individual relationship which is constant throughout the groups, and B refers to the other part whose size depends on the value of $\overline{X}_i$, this being taken as a deviation from the overall mean $\overline{X}$. B indicates the interaction between individual and group effects. By substituting (6) into (5) one gets:

$$
\begin{aligned}
Y_{ij} &= A_0 + A\overline{X}_i \\
&\quad + [B_0 + B(\overline{X}_i - \overline{X})](X_{ij} - \overline{X}_i) \\
&= A_0 + A\overline{X}_i + B_0(X_{ij} - \overline{X}_i) \\
&\quad + B(\overline{X}_i - \overline{X})(X_{ij} - \overline{X}_i)
\end{aligned} \tag{7}
$$

The model presented in (7) allows for the simultaneous estimation of the effects of group position $\overline{X}_i$; of individual position $(X_{ij}-\overline{X}_i)$; and of the multiplicative combination (interaction) of both. Defining this term as the product of deviations from means—$(X_i-\overline{X})(X_{ij}-\overline{X}_i)$—keeps its correlation with each of the other two predictors at a low level. Had the interaction term instead been measured by the product of X_{ij} and $\overline{X}_i$, it would have been so highly correlated with each of them that the least-squares estimation would not have yielded best unbiased estimates. The way the interaction is defined in (7) eliminates such unwanted collinearity and provides for best unbiased estimates.

Estimates of the Model and Discussion

The model developed in the previous section and summarized in equation (7) accounts well for the roll-call voting of House representatives. The multiple R^2 varies from .38 (foreign policy, 86th Congress) to .72 (civil rights, 85th Congress). Table 2 presents these summary measures along with the standardized regression coefficients of the various effects.

The standard coefficients reveal that, in all policy domains, party, i.e., the shared attitude of a party group, proves far more influential than does the individual attitude. The latter effect is not reduced to insignificance, but is modest by comparison. Judging these results according to the typology of models introduced earlier, one would not want to identify this pattern with the "group effect only" model, but rather, in elaborating the earlier distinction, with a model combining a strong group effect with a weak individual effect.

It may come as a surprise that the civil rights domain, according to the coefficients presented in Table 2, does as well as or even better than the social welfare domain, as far as the strength of the party effect is concerned; recall that, in the aggregate, voting positions diverged somewhat from attitudes in the civil rights domain. One reason for the unusually high party effect in this domain lies in the surprisingly cohesive behavior of nonsouthern Democrats. Their voting record on civil rights, in fact, was unanimous during the 85th Congress. Such a complete lack of individual variance exhibited by one of the three groups strongly tilts the balance toward the "group effect only" side. What the balance might have been in the presence of some individual variation can be gleaned from the figures pertaining to the 86th Congress, where nonsouthern Democrats failed to duplicate their unanimous record of the previous Congress.

In the social welfare domain the strong showing of the party effect coincides with close proximity of shared party attitudes and party voting positions. The reason for this "coincidence" lies, I submit, in the marked partisan distinction of policy attitudes which was noted for this domain. Where party positions are sharply defined in the minds of representatives there is little room for deviation of individuals from the partisan standard.

Finally, the foreign policy domain also dis-

Table 2. Individual, Party, and Interaction Effects on Legislative Voting (Standardized Regression Estimates)

	85th Congress			86th Congress		
Predictor	Foreign Policy	Social Welfare	Civil Rights	Foreign Policy	Social Welfare	Civil Rights
Individual	.36	.26	.28	.36	.25	.31
Party	.53	.65	.79	.48	.76	.74
Interaction	−.12	−.01	−.22	−.12	−.08	−.18
Multiple R^2	.42	.48	.72	.38	.64	.64
(Weighted N)[a]	(652)	(655)	(678)	(721)	(710)	(720)

[a] The unweighted N varies from roughly 120 in the 85th Congress to roughly 130 in the 86th Congress.

lays the expected pattern. With a low degree f party distinction in the realm of attitudes s well as a modest match, in the aggregate, etween attitudes and votes, this domain was ot made for a pronounced party effect on oll-call voting. Compared with the other two lomains, the party effect ranks lowest, whereas he individual effect ranks highest, as could easonably be expected.

Thus far the assessment of the party effect as only occasionally paid attention to variaions of this effect among the three party roups. Not all of them contribute equally to he showing of the party effect in a given donain. Already noted was the extraordinary votng cohesion displayed by nonsouthern Demcrats in the civil rights domain during the 5th Congress. Representatives of the other wo party groups fall dramatically short of uch a level of cohesion. Moreover, individual ttitudes and voting records are significantly orrelated among the other two party groups.

Such a pattern is neatly summarized by the nteraction term. As built into the model, it is ensitive to systematic covariation between the nean party attitude and the slope — or correaion — of the within-group individual relaionship. The estimate for such interaction in he civil rights domain is −.22, indicating that he higher (integrationist) the party attitude is, he weaker the correlation between individual ttitude and voting will be. Nearly all the interaction estimates listed in Table 2 are negative, eing zero at best. This finding demonstrates hat nonsouthern Democrats, whose attitude neans are the highest in all domains (i.e., most iberal, internationalist, integrationist), show he lowest correlations between individual attiude and voting.[30] Compared with members of he other two parties, they rank last in reliance n individual attitudes in casting roll-call votes but rank first in the degree to which they are affected by their shared policy attitude.

As for policy domains, the concept of shared party attitudes performs best in the social welfare domain.[31] Here policy attitudes were found most sharply polarized along partisan lines as well as most closely matched, in the partisan aggregate, by voting positions on the House floor. And the reliance of representatives on their own particular attitudes was found to be at a "local minimum" in this domain. Saying, however, that covariation between individual attitudes and voting is slight does not imply that representatives sacrifice their own attitudes for the sake of party. Their own attitudes are located so closely around their party attitude, and the party groups are separated by such wide distances on the attitude continuum that conflict between individual attitude and party attitude and, thus, the need for sacrific rarely arise.

Shared Policy Attitudes and the Legislative Arena

Now that the importance of shared policy attitudes has been demonstrated, it remains to be shown how such attitudes are translated into party votes within the legislative arena. Perhaps this translation occurs instantly in the minds of most congressmen, especially when the party position is perceived with great clarity by all members. Even then, however, a representative may find it difficult, within a given policy domain, to relate each of the many bills with which he is not greatly familiar to the party attitude. The congressman who is not an expert on a given bill indeed requires some form of communication which spells out for him the party vote on that bill. Two questions can thus be posed: (1) who communicates voting cues to the congressman, and (2) do these cues benefit party cohesion?

[30] This finding can also be demonstrated by comaring the correlations between attitudes and roll-call oting within parties. When averaged across policy lomains, these correlations stand at a value of .28 for ionsouthern Democrats, at .43 for Republicans, and it .49 for southern Democrats. Herb Weisberg sugested to me that the more "individualistic" behavior f southern Democrats was a function of the broad lefinition of the South, which included four border tates along with the former Confederate states. One ould argue that if the Democratic representatives rom the border states were counted among the nonouthern Democrats, it would be the latter group which would exhibit the more marked covariation etween attitude and vote. While this might prove to e the case, it is worth noting, that southern Demcrats, even including Border representatives, were ound to be more united in their policy attitudes than were nonsouthern Democrats.

[31] A vast literature has documented and discussed the strength of the party factor in structuring roll-call voting in this domain of policy. Among the more recent publications, see Marwell, "Party, Region and Dimension of Conflict;" Shapiro, "Computer Simulation;" also consult Aage R. Clausen and Richard B. Cheney, "A Comparative Analysis of Senate-House Voting on Economic and Welfare Policy, 1953–1964," *American Political Science Review*, 64 (March, 1970), 138–152. Clausen and Cheney ((pp. 144–145) distinguish between an "economic policy" dimension and a "social welfare" dimension within the larger domain — not separated in this paper — of government intervention; they found that party was twice as strong a predictor of voting in the economic policy area as in the social welfare area.

Nearly every congressman interviewed in the sample at hand responded positively to the question of whether "there were other members of the House whose views you found especially valuable when it came to making your own decisions." This kind of consultation with trusted colleagues would seem likely to encourage party voting, for it occurs almost exclusively within the ranks of a party group. By the same token, not every representative takes his cue from the same trusted colleagues within his party group. The larger the number of such colleagues whose advice is sought and the wider the differences of their views, the less positive their contribution to party cohesion will be.

In order to examine the nature and strength of that contribution, the analysis turns, again, to the model (see expression [7]) which expressed a representative's roll-call position as a joint function of his own attitude, the party attitude, and the interaction between the two. This model can be applied separately to those representatives who, in a given domain, indicated strong reliance on consultation and to those who indicated otherwise. Such a test is feasible since not every representative sought advice with equal readiness in all three domains. Within a given domain, about one half of the representatives indicated that consultation in that domain was highly important for their own decisions, and the other half did not.[32]

The hypothesis that intensive consultation with trusted colleagues helps a representative vote in accordance with the shared attitude of his party group can be examined by comparing the estimates of the various effects obtained for the two sets of representatives. The figures presented in Table 3 reveal that in almost every instance the party effect relative to the individual effect as well as to the interaction effect is far greater among representatives who consult than among those who do not. To be sure, the party effect is not always enhanced by consultation, but the individual effect is diminished by it close to insignificance, particularly in the social welfare domain. The greater relative weight of the party effect among advice seeking representatives points to the intervening influence of trusted party colleagues on legislative voting.

These findings imply that shared attitudes form the basis for the information and advice provided by those key representatives referred

[32] For a construction of the consultation index and the frequencies, see the codebook for the *Candidate File*, variable numbers 82, 83, 86, 87, 88.

Table 3. Individual, Party, and Interaction Effects on Legislative Voting, with Control for Consultation with Colleagues

a. 85th Congress

Predictor (Standardized)	Foreign Policy		Social Welfare		Civil Rights	
	Consultation		Consultation		Consultation	
	Yes	No	Yes	No	Yes	No
Individual	.23	.43	.06	.32	.19	.32
Party	.54	.49	.62	.65	.79	.78
Interaction	.02	−.27	.08	.01	−.18	−.19

R^2	.31	.57	.54	.68	.70	.70
(Weighted N)	(294)	(232)	(231)	288)	(163)	(366)

to as "trusted colleagues." By relying on such information and advice, the ordinary House member casts a heavily partisan vote reflecting the shared attitudes of his party group. Partisan cohesion in House voting thus rests on the following four pillars: (1) representatives choose informants from the ranks of their own party group, (2) representatives as well as informants share policy attitudes, (3 informants reach their own voting decisions on the basis of shared attitudes, and (4) representatives adopt the decisions of their informants as guide for their own behavior.

Conclusions

Post-Burkean models of representation have reserved for political parties a crucial role as vehicles of representation of the popular will in modern democracies. One of the ways by which a party can play that role is for its representatives to act, during legislative decisions, with cohesion based on widely shared policy goals. This study has examined the influence of "shared policy attitudes" on the voting behavior of members of the U.S. House of Representatives. The findings make a strong case for such influence in the policy domain of social welfare issues. For one, the shared policy attitudes as measured by locations on an attitude scale indicate, with a good amount of precision, the locations of the party groups on the roll-call scale referring to the same domain of policy. Second, even though individuals deviate from their respective party attitude, and despite the fact that such deviations are to some extent matched by deviations from the party's roll-call position, the significance of this individual relationship pales by comparison with the match between party attitude and party voting.

These findings suggest a way to reconcile two approaches to legislative decision making, namely the approach based on the notion of "predisposition" and the approach based on the notion of "personal interaction."[33] The first views the indivdiual act of legislative voting as a response to one's ideological position—what I have called attitude; whereas the second views that act as the result of communication between the representative and other actors in the legislative arena, such as colleagues, legislative leaders, the administration or interest group representatives. The findings presented above have indicated that trusted colleagues leave a marked partisan impact on the voting records of congressmen. This tends to buttress the "personal interaction" hypothesis. On the other hand, these findings have also revealed the impact of predispositional factors, i.e., the shared policy attitudes of members of the same party group. This set of findings hints at a linkage between predisposition and personal interaction. By selecting informants from the ranks of their own party, congressmen pick colleagues whose attitudes they are most likely to share. In fact, it can be argued that his desire to find like-minded informants leads a congressman to a party colleague.[34] This choice sets the stage for shared policy attitudes to leave a partisan imprint on the ultimate voting decision of a congressman.

Even though some of the elusive traces of party in legislative behavior have been tracked, some elusiveness remains. One of the questions raised by this analysis is, Who are those informal partisan leaders known as "trusted colleagues?" Are they identical with the members of the committee dealing with a bill on which advice is sought? One might wish to examine both the degree to which these committee members rely on the shared party attitude for their *own* behavior and the degree to which they help their fellow party members in the House reach their decisions. Furthermore, the impact of these "informal" partisan leaders should be compared with the impact of the elected floor leaders in the House. A fuller understanding of the role of party in legislative decision making awaits consideration of these questions.

Symmetric Spatial Games Without Majority Rule Equilibria*

RICHARD D. MCKELVEY AND PETER C. ORDESHOOK
Carnegie-Mellon University

Spatial models of election competition now constitute a major part of the application to political science of the rational choice paradigm. Critics, of course, may disagree over the empirical adequacy of a particular model's assumptions. Nevertheless, the path of spatial theory's development—commencing with Downs's seminal analysis[1]—exhibits a concerted effort to accommodate numerous theoretical and empirical considerations (with varying degrees of success), including multidimensional issue spaces, variations in the functional form of citizens' utility functions, alternative hypotheses about abstention and candidate objectives, risky strategies, sequential elections, the electoral college, sophisticated voting, and the proper conceptualization of spatial analysis as a substantively interpreted application of game theory and social choice theory. Undoubtedly, we should anticipate further developments, including models that address elections other than two party majority rule contests.

Despite the achievements of spatial theory, however, *all* models that seek an explicit prediction about candidate strategies focus on a single solution concept—pure strategy equilibria—and thereby suffer from a common and seemingly devastating shortcoming: they assume either that the election concerns a single issue or that citizens' preferences are distributed with perfect mathematical symmetry.[2] Even if every other restrictive assumption heretofore considered is satisfied, abandoning these two restrictions on preference renders spatial theory incapable of revealing propositions about the strategies candidates should adopt. We attribute this state of affairs to the fact that unless the assumption of unidimensional or symmetrically distributed preference is satisfied, the solution to the election game posited by spatial theory does not generally exist. In this essay we consider the game-theoretic extension of pure strategy equilibria—mixed minimax solutions—and we examine the possibility of using this extension to admit more general and more empirically reasonable analyses of election competition.

In the first section we introduce some elementary notation, and we review the general perspective of spatial theory and the reasons that sufficient conditions for majority rule equilibria are restrictive. Additionally, we discuss why spatial theorists are reluctant to extend their notion of a solution to mixed minimax strategies. The second section contains the main theoretical results of this essay. Specifically, after admitting the possibility that candidates adopt mixed strategies, we hypothesize that such strategies provide a reasonable solution to election games without pure strategy equilibria. Our hypothesis is based, first, on showing that for a general class of two-person zero-sum games, the support set of a mixed minimax solution (i.e., the set of pure strategies to which a solution assigns a nonzero probability) is restricted to a particular subset of the pure strategies. Second, we show that for the class of spatial games in which citizens' preferences are characterized by simple Euclidean distance functions, the support set of minimax solutions is limited to a well-defined subset of the issue space, and that for continuous densities of electoral preference, this support set typically is small. We conclude this section with the argument that this support set may be of special interest for even a sequential conceptualization of campaigns. In the third section we examine the frequently blurred distinction between spatial conceptualizations of two candidate elections and of committees. We conclude that while this distinction is unimportant if pure strategy equilibria exist, it is critically important otherwise. Specifically, the policies implied by solutions to the committee problem (i.e., solution concepts from n-person game theory) if pure strategy equilibria do not exist, differ generally from the policies adopted by candidates who abide by the minimax principle.

The Theoretical Context

Spatial models use a variety of assumptions about candidates and citizens. All models of two candidate competition, however, can be viewed simply as substantively interpreted two-person zero-sum games—games in which the players are the candidates, a strategy is a position on each of n dimensions (issues), and a candidate's payoff

* We wish to thank the National Science Foundation for their support of this research and Richard Mickelsen for his technical assistance.

[1] Anthony Downs, *An Economic Theory of Democracy* (N.Y.: Harper & Row, 1957)..

[2] One exception to the use of this condition is Melvin J. Hinich, John O. Ledyard and Peter C. Ordeshook, "A Theory of Electoral Equilibrium: A Spatial Analysis Based on the Theory of Games," *Journal of Politics*, 35 (February, 1973), 154–193. There, however, the restrictive assumption of continuous concave-convex payoff functions is used.

e.g., probability of winning, expected plurality, and so on) is determined by each citizen's evaluation of respective strategies and a decision rule for revealing his preference. A model's prediction about the issue positions of candidates, then, follows from the game-theoretic notion of a solution—an equilibrium strategy pair, i.e., a pair of spatial positions such that once there, neither candidate possesses any incentive to deviate unilaterally.

In this essay, we focus on a limited class of models. Our procedure is to introduce that class by rigorously developing its game-theoretic structure and by conducting the analysis within that structure. Since spatial models share a common theoretical foundation, if not particular substantive assumptions, this provides a general perspective for resolving spatial theory's dependence on a single solution concept.

We begin formally by letting X denote the set of feasible alternatives or strategies, by letting C be the set of all voters, and by letting μ be a finite measure on C such that $\mu(A)$ represents the "number" of voters in the set $A \subseteq C$. (Note that the technical terminology of measure is used here to admit the possibility of a continuum of voters, as when the distribution of voter preferred points is approximated by a continuous density. If C is finite and if each voter possesses one vote, then μ is simply the counting measure.) Assuming now that each citizen $c \epsilon C$ possesses a utility function $U_c: X \rightarrow R$, such that he prefers x over $y \epsilon X$ if and only if $U_c(x) > U_c(y)$, individual preferences determine a majority preference relation over X thus:

> $x \epsilon X$ is *majority preferred* to $y \epsilon X$ (written $x \succ y$) if and only if $\mu(S_{xy}) > \mu(S_{yx})$,

and

> $y \epsilon X$ is *not majority preferred* to $x \epsilon X$ (written $x \precsim y$) if and only if $\mu(S_{xy}) \geq \mu(S_{yx})$,

where S_{xy} is the set of all citizens who strictly prefer x to y, i.e., $S_{xy} = \{c \epsilon C \mid U_c(x) > U_c(y)\}$, and S_{yx} consists of all citizens who strictly prefer y to x, i.e., $S_{yx} = \{c \epsilon C \mid U_c(y) > U_c(x)\}$. Thus, if $x \succ y$, x defeats y in a majority vote, while if $x \precsim y$, y does not defeat x. Using this preference relation we construct a two-person constant-sum symmetric game.[3] Specifically, we form the game (φ, X) by assuming that each player's strategy consists of the set X, that player 1's payoff function is

$$\varphi_1(x,y) = \begin{cases} 1 \text{ if } x \succ y \\ 1/2 \text{ if } x \sim y \\ 0 \text{ if } x \prec y, \end{cases}$$

and that player 2's payoff function is $\varphi_2(x,y) = 1 - \varphi_1(x,y)$.

To interpret (φ, X) as a spatial model of election competition under majority rule, then, we assume that (1) the players are candidates, where each candidate seeks to maximize his probability of winning; (2) all citizens vote unless they are indifferent; (3) a strategy $x \epsilon X$ is a position on each of n issues such that alternative positions on an issue are represented by a segment of the real line (thus $X \subseteq R^n$), and; (4) all citizens possess identical perceptions of each candidate's strategy.

One definition of a solution to (φ, X), now, is the notion of a pure strategy equilibrium:

Definition 1: (θ_1^*, θ_2^*) is a *pure strategy equilibrium pair* if and only if

$$\varphi_1(\theta_1^*, \theta_2) \geq \varphi_1(\theta_1^*, \theta_2^*) \geq \varphi_1(\theta_1, \theta_2^*)$$

for all $\theta_1, \theta_2 \epsilon X$.

Furthermore, if

$$\theta_1^* = \theta_2^* = \theta^*,$$

then θ^* is said to be an *equilibrium strategy*.

The problem with this solution concept, however, is that pure strategy equilibria need not exist. The simple illustration of the paradox of voting, in which $X = \{A,B,C\}$, and $A \succ B$, $B \succ C$, and $C \succ A$, is an admissible counter example to universal existence. For the spatial game, Plott's necessary and sufficient conditions and Sloss's generalization of them reveal, in fact, that spatial strategies satisfying Definition 1 exist only under extremely limited conditions—conditions such as unidimensional or symmetrically distributed preference.[4] In particular, if we represent citizens' utility functions by Euclidean distance, a pure strategy equilibrium exists only if *all* median lines of the electorate's preference distribution intersect at a common point.[5]

[3] Briefly, a two-person zero-sum game is symmetric if the strategy sets of both players are identical, if the value of the game to both players is zero and if $\varphi_1(x,y) = \varphi_2(y,x)$ for all x and y—i.e., if they interchange strategies, they interchange payoffs. A constant sum game, moreover, is equivalent to a zero-sum game since for any constant sum, there exists a positive monotonic transformation of the payoffs that renders the game zero-sum (e.g., substitute the payoffs, 1, 0, −1 for 1, 1/2, 0).

[4] Charles R. Plott, "A Notion of Equilibrium and its Possibility Under Majority Rule," *American Economic Review*, 57 (September, 1967), 787–806; and Judith Sloss, "Stable Outcomes in Majority Rule Voting Games," *Public Choice*, 15 (Summer, 1973), 19–48.

[5] See Otto A. Davis, M. DeGroot, and Melvin J. Hinich, "Social Preference Orderings and Majority Rule," *Econometrica*, 40 (January, 1972); and R. W. Hoyer and Lawrence S. Mayer, "Comparing Strategies in a Spatial Model of Electoral Competition," *American Journal of Political Science* (1974).

By relying wholly on this solution concept, then, spatial theory implicitly assumes that unless pure strategy equilibria exist, parsimonious propositions about the policy positions candidates adopt cannot be formulated. Consequently, a substantial amount of theorizing can be viewed not simply as the attempt to weaken assumptions or to ascertain the implications of alternative structures, but to establish sufficient conditions for a majority rule equilibrium. In fact, while assumptions are justified frequently because they are tractable, the definition of tractability usually is that they yield identifiable equilibria such as the electorate's median preference. Thus, since the existence of equilibria is unusual in even the simplest model, it is not surprising to find spatial theorists imposing restrictive or empirically untenable assumptions.

That pure strategy equilibrium solutions need not exist to two-person zero-sum games such as (φ,X) is, of course, well known. It is precisely this fact that led Von Neumann and Morgenstern to introduce the concept of a *mixed strategy* and to resolve partially the issue of an appropriate solution by proving that every such game with finite strategies possesses an equilibrium minimax solution in either pure or mixed strategies.[6]

Game theory, then, suggests a logical extension for spatial analysis in the event that pure strategy equilibria do not exist—namely, mixed minimax strategies. In conjunction with our assumptions about payoffs, for example, the cycle in which $X=\{A,B,C\}$ and $A\succ B\succ C\succ A$ yields the following two-candidate constant-sum game (payoffs are to Candidate 1):

		Candidate 2		
		A	B	C
Candidate 1	A	1/2	1	0
	B	0	1/2	1
	C	1	0	1/2

Figure 1

Although this game does not possess a pure strategy equilibrium, it has a mixed strategy equilibrium—$P_1=(1/3, 1/3, 1/3)$ and $P_2=(1/3, 1/3, 1/3)$. That is, by choosing a strategy randomly, each candidate guarantees himself an *expected* payoff of at least 1/2, and no other strategy provides such a guarantee.

Despite the mathematical closure of the problem provided by Von Neumann and Morgenstern, spatial theorists resist this extension.[7] Their argument is twofold. The first objection concerns the inherent lack of specificity of mixed strategies as to the spatial positions candidates eventually adopt. Pure strategy equilibria are appealing (especially if they are unique) because they identify unambiguously the policies candidates should advocate. Mixed strategies, on the other hand, by design seek to disguise a candidate's ultimate choice of policy. For the game in Figure 1, for example, every pure strategy is a possible outcome. For those, then, who desire explicit predictions about the policies engendered by majority rule procedures, the mixed strategy notion seems less than satisfactory.

The main thrust of our argument in the next section, however, is that while mixed minimax strategies necessarily entail some ambiguity, they can nevertheless limit considerably our expectations about the spatial positions candidates adopt.

The second argument against the use of mixed strategies in a simple spatial context concerns the dynamics of campaigns. Specifically, the most reasonable model of the extensive form of the election game is one in which candidates are permitted to sequentially adjust their spatial positions. A pure strategy for this extensive form game is not simply an element of X, but a "game plan"—a specification of a spatial response to an opponent's position for each and every adjustment period. Thus, if we retain our present conceptualization of pure strategies, we necessarily violate the conditions for regarding minimax strategies as solutions—the conditions being that both candidates announce their pure strategies simultaneously and neither player is permitted to alter his choice thereafter (e.g., payoffs are realized immediately). This violation seems unimportant, though, if the minimax strategy corresponds to a pure strategy equilibrium since neither candidate possesses any incentive to move unilaterally from the equilibrium. But, if the minimax strategy is mixed, the abstraction of spatial theory from the true extensive form of the election game seems to preclude its applicability. The essential problem is that the spatial positions candidates adopt in accordance with a mixed minimax strategy are not in equilibrium. Thus, if no prohibitions to sequential adjustment exist, at least one candidate should change his strategy

[6] John Von Neumann and Oskar Morgenstern, *Theory of Games and Economic Behavior*, 2nd ed. (Princeton: Princeton University Press, 1947).

[7] See, for example, William H. Riker and Peter C. Ordeshook, *An Introduction to Positive Political Theory* (Englewood Cliffs, N.J.: Prentice-Hall, 1973), p. 340, and Richard D. McKelvey, "Policy Related Voting and Electoral Equilibrium," *Econometrica*, 43 (September, 1975), 815–843.

on the next move. For example, if the candidates abide by the mixed strategy (1/3, 1/3, 1/3) for the game we illustrate in Figure 1, Candidate 1 can find himself choosing A and losing the election because his opponent chose B. Clearly, he should shift to another alternative if permitted to do so, and not take solace from the fact that he chose A in accordance with a mixed minimax solution to a myopic model.

In this essay, however, we pursue the logical consequences of the hypothesis that candidates abide by mixed minimax solutions to the simple spatial game for several reasons. First, such an analysis seems an essential first step toward the construction of sequential models. Second, if we assume that the campaign consists of a sequence of simultaneous moves but that candidates possess sufficient spatial mobility at each move, then we should anticipate the choice of spatial positions in the support set for solutions to a myopic model. Finally, if the candidates adjust their strategies one after the other, but if their adjustments are designed to be secure against the opponent's history, then again we anticipate spatial positions within the support set. We elaborate these arguments later in the next section. First, however, we turn to the simple mixed strategy extension of the myopic model.

The Support of Mixed Minimax Strategies

To extend the analysis of (φ,X) to mixed strategies, let $\tilde{X}$ denote the set of probability measures over X (i.e., the set of all pure and mixed strategies).[8] Then, for any P_1, $P_2 \epsilon \tilde{X}$, we define φ_1 thus:

$$\varphi_1(P_1,P_2) = \sum_x \sum_y \varphi_1(x,y)P_1(x)P_2(y)$$

if P_1 and P_2 are discrete, or

$$= \int \left[\int \varphi_1(x,y)dP_1(x)dP_2(y) \right]$$

if P_1 and P_2 are continuous.

These definitions generate, then, a new symmetric, two-person constant-sum game, denoted $(\varphi,\tilde{X})$. Thus, if P^* is a minimax solution to this game, our objective is to establish the bounds on P^*, i.e., the subset of X to which P^* assigns positive measure. To do this we let

$$D_y = \{x \epsilon X \mid x \succ y\}$$

$$D_y^* = \{x \epsilon X \mid x \succsim y\}$$

[8] Formally, if B is a σ-algebra of sets in X, a probability measure P:B $\rightarrow$ R is a set function satisfying the usual probability axioms. I. e., for each A, BϵB, O $\leq$ P(A) $\leq$ 1 and A $\cap$ B $=$ Φ $\Rightarrow$ P(A) $+$ P(B) $=$ P(AUB). We use the notation P(x) $=$ P({x}).

That is, D_y consists of all strategies in X that strictly defeat y while D_y^* consists of all strategies in X that y does not defeat. Clearly, $D_y \subseteq D_y^*$.

The usual game-theoretic definition of domination states that a strategy x weakly dominates a strategy y if x is at least as good as y in every possible contingency and better in some. In the context of the above game, where the possible payoffs consist only of a win, a loss, or a tie, we express weak domination thus: For any x, $y \epsilon X$, x *weakly* dominates y iff $D_x^* \subseteq D_y$. After eliminating any or all weakly dominated strategies, we obtain the following definition:

Definition 2: A set $\Omega \subseteq X$ is said to be *admissible* if, for each $y \epsilon X$, with $y \notin \Omega$, there is an $x \epsilon \Omega$ such that

$$D_x^* \subseteq D_y.$$

We also define a weaker type of admissible set, which we call weakly admissible:

Definition 3: A set $\Omega \subseteq X$ is said to be *weakly admissible* if, for each $y \epsilon X$ with $y \notin \Omega$, there exists an $x \epsilon \Omega$ such that

$$D_x^* \cap \Omega \subseteq D_y \cap \Omega.$$

A set Ω is admissible, then, if for each $y \notin \Omega$, there exists an $x \epsilon \Omega$ such that $z \succsim x \Rightarrow z \succ y$ for all $z \epsilon X$. (Note that an admissible set can contain dominated strategies.) Further, since x is not majority preferred to itself ($x \sim x$), and since $x \epsilon X$, then $x \succ y$. A weakly admissible set, Ω, on the other hand, allows for the elimination of strategies that are dominated only in Ω. That is, Ω is weakly admissible if for every $y \notin \Omega$, there exists an $x \epsilon \Omega$ such that $z \succsim x \Rightarrow z \succ y$ for all $z \epsilon \Omega$. And as before $x \epsilon \Omega$ so $x \succ y$. Note that if the set Ω is admissible it is also weakly admissible, but a weakly admissible set need not be admissible. For example, successive elimination of dominated strategies results in weakly admissible sets that may not be admissible. Not all admissible sets can be obtained, however, by a successive application of domination.

To illustrate these ideas, consider Figure 2 and note first that no strategy is at least as good as another under all contingencies. Hence the set of all strategies $\{a,b,c,d,e,f\}$ is admissible, and no subset of this set is admissible. Nevertheless, the set $\{a,b,c\}$ is weakly admissible. For example, $d \notin \{a,b,c\}$ is defeated by a while everything in $\{a,b,c\}$ that defeats a, namely b, also defeats d. That is, with respect to the set $\{a,b,c\}$, a is at least as good as d and sometimes better.

	a	b	c	d	e	f
a	0	−1	1	1	−1	1
b	1	0	−1	1	1	−1
c	−1	1	0	−1	1	1
d	−1	−1	1	0	0	0
e	1	−1	−1	0	0	0
f	−1	1	−1	0	0	0

Figure 2

The value of isolating admissible sets derives now from the following well known result of game theory:

Theorem 1: If P^* is a minimax solution for the reduced game (φ,Ω) where $\Omega\subseteq X$ is an admissible set, then P^* is a minimax solution for the game $(\varphi,\tilde{X})$.

Actually, the same result holds for weakly admissible sets:

Theorem 2: If P^* is a minimax solution for the reduced game (φ,Ω), where $\Omega\subseteq X$ is a weakly admissible set, then P^* is a minimax solution for the game $(\varphi,\tilde{X})$.

Proof: Since P^* is minimax over Ω, it must be the case that

$$P^*(D_x\cap\Omega) \geq 1/2$$

for all $x\epsilon\Omega$—otherwise x defeats P^*. But, since Ω is weakly admissible, then for any $y\notin\Omega$, $\exists x\epsilon\Omega$ such that $D_x\cap\Omega\subseteq D_y\cap\Omega\subseteq D_y$, in which case $P^*(D_y)\geq P^*(D_x\cap\Omega)\geq 1/2$. Thus, P^* is minimax over X. Q.E.D.

It follows that mixed minimax strategies can be limited not only to admissible but to weakly admissible sets as well. From Theorem 2, then, the mixed strategy solution to the game we illustrate in Figure 2, excluding strategies *d*, *e*, and *f*, is a solution to the full game. In fact, the mixed strategy solution to this game is (1/3, 1/3, 1/3, 0, 0, 0)—i.e., zero probability is given to the three strategies not in the weakly admissible set $\{a, b, c\}$.

For these results to be of interest, we must show, within the context of our problem—spatial theory—that such sets necessarily exist. To this end, we offer the following theorem.

Theorem 3: The set of Pareto optimals in X is an admissible set.

Proof: Let $Q\subseteq X$ be the set of Pareto optimal pure strategies and let $y\notin Q$. Then, by the definition of Pareto optimality, there exists an $x\epsilon Q$ such that $U_c(x)\geq U_c(y)$ for all $c\epsilon C$ with ">" holding for at least one $c\epsilon C$. Suppose $z\epsilon D_x^*$. Then, $z\succsim x$. But, since x is strictly preferred to y by at least one voter, it follows that $z\succ y$. Hence, $z\epsilon D_y$, which implies that

$$D_x^*\subseteq D_y$$

Thus Q is admissible. Q.E.D.

Taken together, Theorems 1 through 3 state that if a minimax strategy exists to the game over X—pure or mixed—there exists at least one such strategy that gives positive weight only to Pareto optimal positions.[9] This conclusion can be viewed as uninteresting, though, since the set of Pareto optimals typically is large—in the spatial problem, with utilities as introduced below, it must encompass all ideal points and can include all of X (as when the distribution of preferences is given by a normal density). Note, however, that Theorems 1 and 2 make no use of spatial concepts, and in this sense they are completely general propositions about symmetric two-person zero-sum games given the appropriate assumptions about payoff. Our intent, then, is to add a particular spatial assumption about citizens' preferences and prove first that a well defined subset of the Pareto optimals is admissible in the resultant model. By way of example, we then suggest that the notion of weak admissibility can further restrict our expectations about candidate strategies.

The particular spatial model we consider is limited, but it is the basis for much theorizing. Specifically, assume that for all citizens $c\epsilon C$, there is an ideal point $x_c\epsilon R^n$ such that

$$U_c(x) = -(x - x_c)'(x - x_c) = -\|x - x_c\|^2 \qquad (2)$$

[9] Note that Theorems 1 and 2 do not imply that there cannot exist mixed minimax strategies that give positive weight to positions not in admissible or weakly admissible sets (recall that minimax strategies need not be unique). With respect to Theorem 3, however, it is straightforward to show that such strategies cannot exist outside of the Pareto optimals, Q. Briefly, from the definition of Pareto optimality we see that the weak inequality in expression (1) holds for all $z\epsilon X$, while strict inequality holds for at least one $z\epsilon X$, namely x. Thus, any strategy, P, that gives positive weight to some position not in Q, can be strictly dominated by a strategy P'. In the case of a finite strategy space, for example, if $P(y) \neq 0$ for some $y\epsilon Q$, we can define P' thus,

$P'(z) = P(z)$, $z\epsilon Q$, $z \neq x$

$P'(y) = 0$

$P'(x) = P(y) + P(x)$, $x\epsilon Q$, $x \succ y$

By successively applying this transformation for all y Q to which P gives positive weight, we arrive at a strategy that dominates P but which gives weight only to Q. This result is established elsewhere by Peter C. Ordeshook, "Pareto Optimality in Electoral Competition," *American Political Science Review*, 6 (December, 1971), 1141–1145.

actually, we can assume that $U_i(x)$ is any monotonically increasing function of $-\|x-x_c\|$).

Relegating proofs to an appendix, let H be a hyperplane in R^n (e.g., a line in two dimensions). Thus, H is a median hyperplane (e.g., line) if and only if it bisects the density of preferences in a particular direction—if and only if it divides R^n into two half spaces H^+ and H^- such that $\mu(H^+)\leq 1/2$ and $\mu(H^-)\leq 1/2$. A point $x\epsilon R_n$ is called a partial median if and only if it is the intersection of n distinct median hyperplanes. Letting I be the set of all such points and I^* its convex closure, we prove the following theorem in the appendix to this essay:

Theorem 4: Given expression (2), I^* is an admissible set.

The central corollary that follows from Theorems 1 and 4, then is,[10]

Corollary 1: Given expression (2), a minimax solution to the reduced game $(\varphi,\tilde{I}^*)$ is a minimax solution to the game $(\varphi,\tilde{X})$.

Note, moreover, that given our assumptions, the necessary and sufficient condition for the existence of a pure strategy equilibrium is that all median hyperplanes intersect at a common point. Under this condition I^* reduces to a point so that Corollary 1 can be viewed simply as a generalization of existing theory.[11]

The question, nevertheless, that we must now address if pure strategy equilibria do not exist concerns the size of the admissible set I^*. If this set is large relative to X or to the set of Pareto optimals, then our analysis fails to limit our expectations about the positions candidates ultimately adopt in campaigns. Stated differently, if I^* is large, we possess a theory that is nearly vacuous empirically since any observed strategy choice may be consistent with the hypothesis suggested by Corollary 1. But, if I^* is small and our expectations more limited, the theory is more

[10] An important issue that Theorem 4 and its corollary fail to address is whether minimax strategy solutions exist in simple multidimensional elections. We know from the minimax theorem that if X is finite such strategies necessarily exist. From a practical perspective, moreover, this is perhaps the most reasonable context of election competition in the sense that the real constraints on candidate strategies and their perceptions of alternatives may render the game finite. For an infinite strategy space, however, establishing existence is more problematical. This is especially true in our analysis since φ is not continuous (for a proof that continuous zero-sum games over closed convex strategy spaces possess minimax solutions see Guillermo Owen, *Game Theory* [Philadelphia: W. B. Saunders, 1968], pp. 76–78). We conjecture, nevertheless, that the class of spatial games being considered here always possess minimax solutions.

[11] If the number of voters is finite and even, this assertion is not strictly true, given our definition of a median in terms of hyperplanes. Thus, if C is odd or infinite, there exists a unique median in every direction, whereas for C even, median hyperplanes are not necessarily unique. That is, for C even, a median in a particular direction can be a bounded region (e.g., for two voters on a line, the median is the set of all positions between the two ideal points). If we extend our notion of a median to bounded regions, the assertion follows. The definition of medians in terms of hyperplanes is simply a convenience for reducing notational complexity.

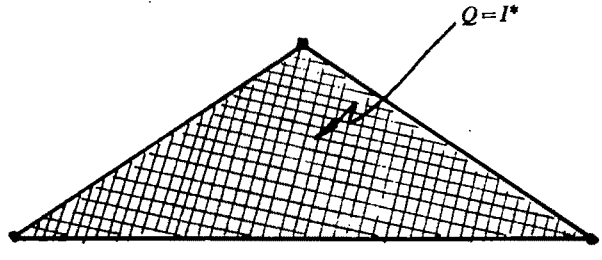

Figure 3: Admissible Set for Three Voters

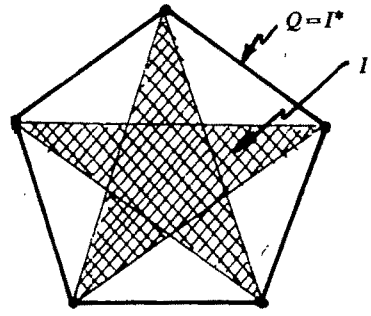

Figure 4: Admissible Set for Five Voters

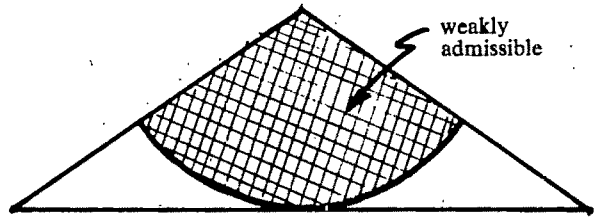

Figure 5: Weakly Admissible Set for Three Voters

readily disproved and, therefore, potentially more powerful.

By way of several examples, we conclude that the admissible set I^* can be either large or small—depending on the electorate's preference distribution. In Figures 3 and 4 we offer two examples in which I^* encompasses the entire set of Pareto optimals. In Figure 3, three voter's ideal points are arrayed in a triangle so that the Pareto optimal set consists of the triangle and all points within it. It is readily verified, moreover, that at least two median lines intersect everywhere in the triangle and, thus, that I^* is "limited" to the Pareto optimals. In Figure 4, five voters are arrayed in a pentagon, so that the set of Pareto optimals consists of the pentagon and all interior points. The shaded star, on the other hand, corresponds to the set of all median line intersections, and we see that I^* again corresponds to the Pareto optimals.

We have, then, these two examples to demonstrate that our expectations about spatial strategies are not necessarily limited by Corollary 1. Nevertheless, we can reduce further our expectations about candidate positions by noting for the three-voter example that the shaded region in Figure 5 is a weakly admissible set.[12]

Weak admissibility, then, can be used to analyze games further if I^* is too large. Unlike the correspondence between I^* and admissible sets, however, there is no simple general geometric characterization for weakly admissible sets. Hence, in practical applications, an admissible set seems the more useful notion; but, to show that Theorem 4 can in fact limit our expectations about candidate strategies, recall that the usual context for spatial theory is large electorates. Suppose, then, that the electorate consists of a continuum of voters whose ideal points are distributed uniformly over the triangle and the pentagon. For these two examples, we denote I^* by the shaded set (see Figures 6 and 7). Clearly, I^* is substantially smaller than the set of Pareto optimals, which again is bounded by the triangle and pentagon.

Thus, in these two examples, the domain of mixed minimax strategies seems limited to a reasonably small region. In fact, if we assume that preferences are more concentrated near the center of the triangle and pentagon, I^* becomes even smaller. The implication of Figures 3 through 7, then, is that for finite, dispersed preferences, I^* can be large; but if we characterize preferences by continuous densities, I^* is smaller and substantively more interesting.

As a final check on this inference, we examine

[12] The identification of I^* in theory is simple in two-dimensions: identify all median lines and hence their intersections, and take the convex hull of these intersections. To generate Figure 8, however, a computer is essential to calculate and plot these median lines for the several values of λ. Identification of the weakly admissible set in Figure 5, on the other hand, is accomplished by trial and error. We note simply that a point at the center of the triangle dominates all of the excluded points within the triangle.

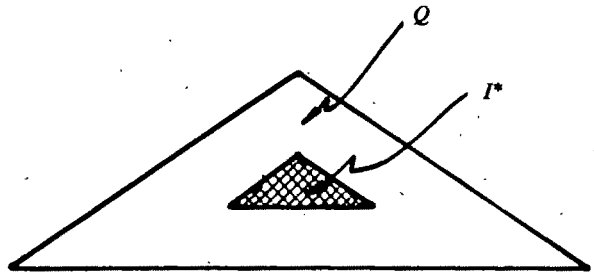

Figure 6: Uniform Distribution of Preferences over Triangle

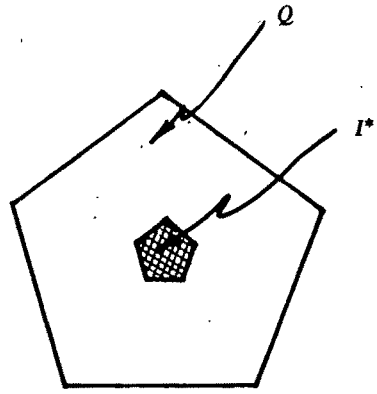

Figure 7: Uniform Distribution of Preferences over Pentagon

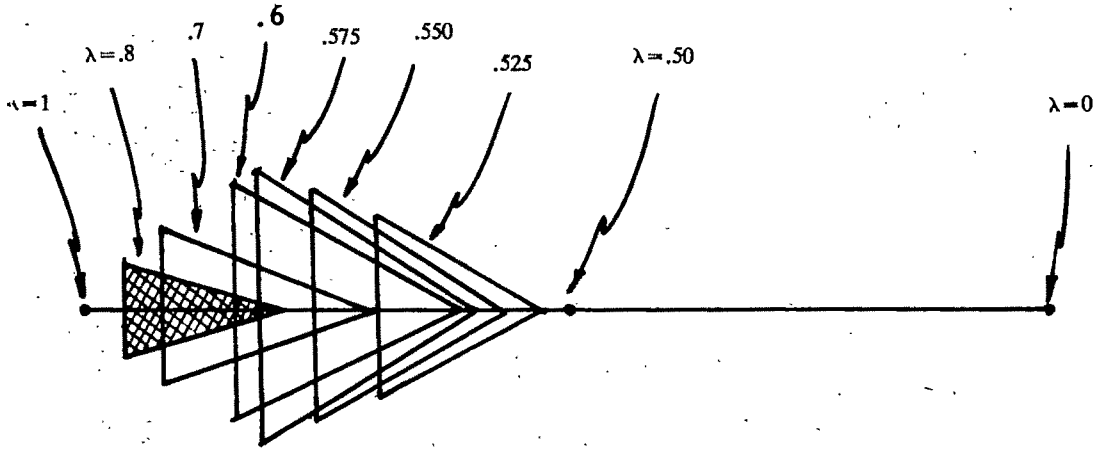

Figure 8: I* for Bimodal Density

the class of nonsymmetric densities that result when two bivariate normals are weighted and summed (in which case all of R^2 is Pareto optimal). Weighting two standardized ($\sigma=1$) densities with means 0 and 5 by λ and $1-\lambda$ respectively, we know, of course, that for $\lambda=0$, 1/2, or 1, the resultant density is symmetric, and, hence, yields a pure strategy equilibrium. In Figure 8, we illustrate the form of I^* for several alternative values of λ that do not yield such equilibria.

The results here are gratifying, in terms of both the size and position of I^*. With respect to size, we see that the width of I^* is not unreasonably large in comparison to the distance between the modes of the preference density.[13] The posi-

[13] We note also that if we decrease the distance between the means of the two bivariate normals used to construct Figure 8 (or, equivalently, increase their variances), the size of I^* decreases. A distance of 5σ, moreover, seems the extreme of opinion polarization.

tion of I^*, moreover, confirms the intuitive supposition that if the electorate's preferences are bimodally distributed, the candidates' strategies will be drawn towards, but not wholly to, the largest mode. Interestingly, except for unidimensional contests, this supposition has not previously been established by spatial theory owing to its dependence on the more restrictive solution concept of pure strategy equilibria.

Despite Corollary 1 and the apparent constraint it places on mixed strategy solutions—at least for games with a continuum of voters—the question again arises: What should a candidate do if permitted to move after revealing his choice of pure strategy? Clearly, if the candidates must again reveal their next move simultaneously and if their current spatial positions do not prohibit mixed strategies over I^*, then Theorem 4 again pertains. That is, each move is simply a repetition of the game (φ, I^*), with the result that candidates choose strategies in I^*.

More interestingly, suppose that after their initial choice of positions, the candidates are permitted to make adjustments one after the other. Our question then is: Might sequential adjustments lead candidates to strategies outside of I^* or some smaller weakly admissible set? The reasons, even with sequential moves, for avoiding strategies outside of the admissible set I^* are obvious. Regardless of whether he is responding to his opponent's current position or to positions his opponent might take in the future, a candidate does at least as well with positions in I^*, and sometimes better than he does with positions outside of it. That is, if he is contemplating the strategy $y \notin I^*$, then there exists an $x \in I^*$ that is at least as good as y under *all* contingencies.

With respect to weakly admissible sets, which admittedly are more difficult to compute, there is a similar but somewhat weaker rationalization. Specifically, suppose Candidate 1 chooses a strategy, w, in the weakly admissible set Ω, and 2 chooses $z \in \Omega$, but that $z \succ w$. Thus, if afforded the opportunity, Candidate 1 prefers to alter his position and find a spatial strategy that renders him a winning rather than a losing candidate. Let $y \notin \Omega$ be such a strategy. Should the candidate move out of Ω to y? The definition of weak admissibility suggests that there is a "better" alternative in Ω, say x, which not only dominates z, but dominates y as well.

For another reason for supposing that candidates adopt strategies in I^* or in potentially smaller weakly admissible sets, consider the following sequential model: Each candidate records the frequency distribution, F, of all previous positions adopted by his opponent and candidates adjust their positions with perfect spatial mobility one after the other. Suppose also, that the candidates' adjustments proceed as in the "method of fictitious play." That is, the candidate with the next move chooses a strategy that is good against his opponent's history, F (i.e., guarantees him an expected payoff of at least a tie, given that his opponent chooses in accordance with the mixed strategy F). Clearly, F changes as the game proceeds. From the theory of finite zero-sum games, however, we know that the overall observed frequency of each candidate's choices approaches, in the limit, the mixed strategy to the myopic game.[14] It follows, then, that while the candidates cycle in a continual process of adjustment and readjustment, they remain in I^*.

This, of course, does not resolve all issues surrounding sequential elections contests—issues such as the effects of imperfect spatial mobility and information. Our analysis does show, nevertheless, that the support of mixed minimax strategies can provide a substantively satisfying constraint on strategic choice in both the static and sequential context.

Committees vs. Elections

The hypothesis that the notions of admissible and weakly admissible sets constrain the policy outcomes of an election assumes that candidates or political entrepreneurs compete for the votes of a passive electorate. Thus, the candidates motivate the social choice by their goal of electoral victory, while citizens simply endorse the candidates they most prefer. This may be a reasonable model for large electorates. In smaller voting bodies without candidates (e.g., committees), however, the voters themselves are the active participants in policy formation, in which case it is more appropriate to model the "election" as an n-person cooperative game and to use n-person solution theory to predict policy outcomes. Since the context of social choice determines the appropriate model, it is reasonable to expect that we can ascertain the effects of political entrepreneurship on policy by comparing the two-person and n-person solution concepts.

Owing, perhaps, to the correspondence between pure strategy equilibria and the core, the distinction between the two-person and n-person models is frequently blurred. That is, since pure strategy electoral equilibria are equivalent to the core of the corresponding n-person game, it is

[14] The theorem is outlined in Owen, *Game Theory*, p. 31, 36–37, and proved in Samuel Karlin, *Mathematical Methods and Theory in Games, Programming and Economics*, Vol. 1 (Reading, Mass.: Addison-Wesley, 1959), pp. 179–189. As proved, the theorem applies, of course, only to finite games. Thus, we can only conjecture that it applies to infinite solvable games as well.

tempting to conclude that the context of social choice does not affect policy. This, however, does not follow since the equivalence between the n-person and 2-person formulations has been shown only when a core or a pure strategy equilibrium exists. And, as we show here, by an example, if these solutions do not exist, this equivalence disappears. Thus, the context of choice affects public policy substantially.

As an example of a case in which the two-person and n-person formulations yield different outcomes, consider an electorate of three citizens with the following transitive preferences over $X=\{a, b, c, d, e, f\}$:

Citizen	*Preference*
1	$a \succ d \sim f \succ c \succ b \succ e$
2	$b \succ e \sim d \succ a \succ c \succ f$
3	$c \succ f \sim e \succ b \succ a \succ d$

Note that these preferences yield the majority dominance relations described in Figure 2. Thus, $\Omega=\{a,b,c\}$ is a weakly admissible set and

$$P(x) = \begin{cases} 1/3 \text{ if } x\epsilon\Omega \\ 0 \text{ if } x\notin\Omega \end{cases}$$

is the minimax solution to the resultant two-person game.

Consider now the $n(=3)$ person game that results from these preferences. Two solution concepts are considered usually to analyze such games—the V-solution and the Bargaining set.[15] Briefly, the V-solution consists of any set, V, that is both internally and externally stable, i.e., $V\subseteq X$ is a V-solution if and only if

(internal stability): $\forall x, y\epsilon V$, $x\sim y$

(external stability): $\forall y\notin V$, $\exists x\epsilon V$ such that $x\succ y$.

Similarly, a policy $x\epsilon X$ is a member of the Bargaining set if there is a coalition $B\subseteq N$ that can secure x and if every member of B can protect his interest in x against objections by other members of B.[16]

It is easy to verify now that $V=\{d, e, f\}$ is a unique V-solution to our game. Furthermore, V is also the bargaining set associated with the minimal winning coalitions in this game. But $V\cap\Omega=\Phi$. Stated differently, the V-solution and the Bargaining set possess no equilibrium properties for candidates.

In this example, then, the policies considered and ultimately proposed by candidates or political entrepreneurs differ completely from the policies that result from a cooperative play of the game. Which solution is "better" depends, of course, on which citizen's opinion you seek. Both solutions yield Pareto optimal outcomes. In this example, however, there is a tendency for the cooperative solution to extract as much as possible from the losers by giving them their least preferred outcomes, and to require compromise between the members of the winning coalition. The two-person solution allows some citizens to realize their most preferred outcome. We do not know, of course, whether these observations are generalizable, but we must conclude that the context of choice can affect outcomes.

Conclusions

One issue that we fail to address in this essay concerns a candidate's ability to compute an appropriate minimax strategy for a particular configuration of preferences. Doubtless, such a computation is exceedingly difficult—so difficult in fact that it seems to push the *as if* principle beyond credulity to argue that candidates act as if they calculate and use mixed minimax strategies. Our prediction about candidates, however, is not that they adopt a particular mixed strategy but, given our assumptions, that they eventually adopt a position in the admissible set I^* and, perhaps, a position in a potentially smaller weakly admissible set. Consider, then, the candidate who is unable to compute the appropriate solution strategy but who knows the general outlines of I^*. Should he choose a position in I^* or not? Our assumption, of course, is that he knows that for every $y\notin I^*$, there exists an $x\epsilon I^*$ that is at least as good and sometimes better against the opponent. Thus, even if he does not know the details of his opponents' strategy or how to calculate the mixed mimimax solution, there is a positive incentive to avoid positions not in I^*. Alternatively, if the candidates move sequentially in accordance with

[15] For a discussion of n-person majority games without side payments (the context of a spatial conceptualization of preferences) see Robert Wilson, "A Game-Theoretic Analysis of Social Choice," in B. Lieberman, ed., *Social Choice* (N.Y.: Gordon and Breach, 1971), pp. 393-408; and Wilson, "Stable Coalition Proposals in Majority Rule Voting," *Journal of Economic Theory*, 3 (September, 1971), 254–271.

[16] Usually, a bargaining set is defined in terms of a payoff configuration and a particular coalition structure. Here, however, exposition is eased if we consider only the payoff configuration x. Note also that payoffs are defined in game theory in terms of utility, whereas here x is a policy position. This transformation of terminology is of no consequence to our analysis owing to the 1 to 1 correspondence (given our assumptions about utility) between payoff configurations and spatial position.

the method of fictitious play, we know that they choose strategies in I^* and in the limit can be said to act as if they calculated mixed minimax strategies.

Relative to mixed minimax strategies, I^* is easy to compute—assuming, of course, that the candidate knows the electorate's preference density. Usually, however, even the best polls afford candidates knowledge only about the distribution of preferences along individual issues (i.e., the marginal densities of μ). But, except perhaps for exaggerated bimodal densities, I^* should generally be small in mass electorates. In fact, a good approximation to I^* is a small region about the intersections of the median lines of the known marginal densities.

In summary, then, our analysis extends one of the most pervasive conclusions of spatial theory—the power and importance of the electorate's "median" preference. Given our assumptions, *on the average we anticipate finding successful candidates at or near the electorate's median preference on each salient issue of the election even if the distribution of ideal points is not symmetric.*

Appendix: Proof of Theorem 4

Before proceeding to a formal proof of Theorem 4 we offer an informal description of the method of proof for the two-dimensional case. In Figure 9, I^* represents the convex closure of the set of partial medians. To show that I^* is an admissible set, for any point $y_0 \notin I$, we pick $x_0 \in I^*$ such that x_0 is the closest point to y_0 in I^*. Since I^* is convex, there is a hyperplane (line), H, that is perpendicular to and bisects the line connecting y_0 and x_0, such that y_0 is on one side and I^* is on the other side. Since there exists a median hyperplane, M_1, parallel to H (lemma 1) and since this median hyperplane passes through I^* (lemma 3) it follows that x_0 is closer to M_1 than is y_0. Thus, x_0 defeats y_0 (lemma 2). Now let z be any other point in X such that $z \gtrsim x$. Thus, there must exist a median M_2 in the direction of $z - x_0$ (i.e., perpendicular to the line connecting z and x_0) that is closer to z than to x_0 (lemma 2). Suppose now that, contrary to Theorem 4, $y_0 \gtrsim z$. By the same argument, there must exist a median M_3 in the direction $y_0 - z$ that is closer to y_0 than to z. But

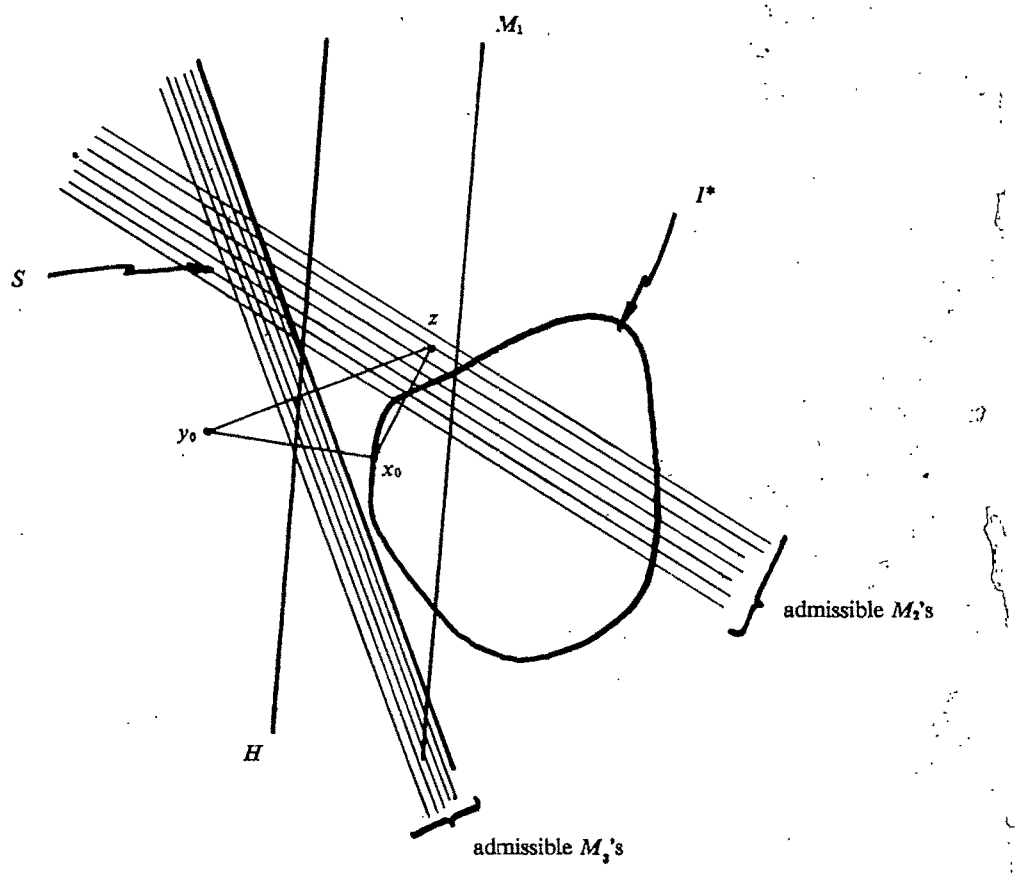

Figure 9

this yields a partial median in the region S, which is impossible since S is on the wrong side of the separating hyperplane H. Thus, $z \succ y_0$, in which case I^* is an admissible set since for any $y_0 \notin I^*$, $\exists x_0 \in I^*$ such that $x_0 \succ y_0$ and $\forall z$, $z \succsim x_0 \Rightarrow z \succ y_0$.

More formally, let a *hyperplane* $H \subseteq R^n$ be any set of the following form:

$$H = \{x \in R^n \mid x.a = b\}$$

for some $a \in R^n$ and $b \in R$, and let $\overline{H}$ be the set of all hyperplanes. Thus, any $H \in \overline{H}$ partitions the space into three exhaustive disjoint sets, H, H^- and H^+, where

$$H^- = \{x \in R^n \mid x.\ a < b\}$$
$$H^+ = \{x \in R^n \mid x.\ a > b\}$$

A hyperplane, H, is defined as a *median hyperplane* if and only if $\mu(H^+) \leq 1/2$ and $\mu(H^-) \leq 1/2$. We define $\overline{M}$ as the set of all median hyperplanes, i.e.,

$$\overline{M} = \{H \in \overline{H} \mid \mu(H^+) \leq 1/2 \text{ and } \mu(H^-) \leq 1/2\}$$

We now state several elementary lemmas without proof that are used in the proof of Theorem 4.

Lemma 1: For any $a \in R^n$, there exists a $b \in R$ such that if $H = \{x \mid x.a = b\}$, $H \in \overline{M}$.

Stated simply, Lemma 1 asserts that there exists a median hyperplane in every direction. Notationally, we use b_a to denote some value of b associated with a particular $a \in R^n$ and

$$M_a = \{x \mid x.\ a = b_a\}$$

to denote a median associated with the vector a.

Our next lemma states that if $y, x \in R^n$, x is preferred to y by a majority of citizens if and only if a median in the direction $x - y$ is closer to x than to y.

Lemma 2: If $U_c(x) = \|x_c - x\|^2$ for all $c \in C$, then for any $x, y \in R^n$, $x \succsim y$ if and only if there is some b_{x-y} such that

$$b_{x-y} \geq \frac{(x+y)\cdot(x-y)}{2} = \frac{\|x\|^2 - \|y\|^2}{2}$$

where $x \succ y$ if "$>$" holds.

We now offer several additional definitions and a third lemma.

Definition A1: If $M_{a_1}, \ldots, M_{a_m} \in \overline{M}$ is a set of median hyperplanes generated by the vectors $a_1, \ldots, a_m \in R^n$, then the median hyperplanes are *independent* if and only if $\{a_1, \ldots, a_m\}$ are linearly independent.

Note that if $M_1, \ldots, M_n \in \overline{M}$ are independent,

$$\bigcap_{i=1}^{n} H_i$$

consists of a unique point. This follows because $\{x.a_i = b_i \mid 1 \leq i \leq n\}$ is a set of n linearly independent equations in n unknowns and, hence, possesses a unique non-trivial solution.

Definition A2: A vector $x \in R^n$ is called a partial median if there is a basis $\{a_1, \ldots, a_n\}$ for R^n such that

$$x \in \bigcap_{i=1}^{n} M_{a_i}$$

We use the notation I to denote the set of all partial medians in R^n and I^* to denote its convex closure. It is easy to show, now, that every median hyperplane passes through I^*.

Lemma 3: For every $M \in \overline{M}$, $M \cap I \neq \Phi$, and if $M_1, \ldots, M_k \in \overline{M}$ are independent, for $1 \leq k \leq n$, then

$$\left(\bigcap_{i=1}^{k} M_i\right) \cap I^* \neq \phi.$$

We proceed now to the proof of Theorem 4.

Theorem 4: Given expression (2), I^* is an admissible set.

Proof: Let $y_0 \notin I^*$. Since I^* is closed and convex, there exists an $x_0 \in I^*$ that minimizes the distance of y_0 to I^* as illustrated in Figure 8. We pick such an $x_0 \in I^*$ and claim that $x_0 \succ y_0$. This follows because

$$H = \{x \mid x \cdot (x_0 - y_0) = \frac{(x_0 + y_0)}{2} \cdot (x_0 - y_0)\}$$

in a separating hyperplane, i.e., $y_0 \in H^-$ and $I^* \subseteq H^+$. But then, since $M_{x_0 - y_0} \cap I^* \neq \Phi$ by Lemma 3, it must be the case that $M_{x_0 - y_0} \subseteq H^+$, or equivalently,

$$b_{x_0 - y_0} > \frac{\|x_0\|^2 - \|y_0\|^2}{2}$$

By Lemma 2, it follows that $x_0 \succ y_0$.

Now consider any other z with $z \succsim x_0$. Suppose $y_0 \succsim z$. From Lemma 3, this implies we can find b_{z-x_0} and $b_{y_0 - z}$ satisfying

$$b_{z-x_0} \geq \frac{\|z\|^2 - \|x_0\|^2}{2}$$

$$b_{y_0 - z} \geq \frac{\|y_0\|^2 - \|z\|^2}{2}$$

Let $x^* \epsilon M_{z-x_0} \cap M_{y_0-z}$. Then,

$$x^* \cdot (z - x_0) = b_{z-x_0}$$
$$x^* \cdot (y_0 - z) = b_{y_0-z}$$

or, adding these two expressions and combining with the sum of the previous inequalities,

$$x^* \cdot (y_0 - x_0) = b_{z-x_0} + c_{y_0-z} \geq \frac{\|y_0\|^2 - \|x_0\|^2}{2}$$

which is equivalent to

$$x^* \cdot (x_0 - y_0) \leq \frac{\|x_0\|^2 - \|y_0\|^2}{2}$$

Thus, it must be the case that $x^* \epsilon H^+$. But, since $x^* \epsilon M_{z-x_0} \cap M_{y_0-z}$ and since x^* is arbitrary, we must conclude that

$$(M_{z-x_0} \cap M_{y_0-z}) \subseteq H^- \cup H$$

This yields a contradiction of Lemma 3, i.e., since H is a separating hyperplane and $I^* \subseteq H^+$, the assumption that $z \succsim x_0$ and $y_0 \succsim z$ where $x_0 \succ y_0$, implies that

$$(M_{z-x_0} \cap M_{y_0-z}) \cap I^* = \phi.$$

Thus, for all $z \epsilon I^*$, $z \succsim x_0 \Rightarrow z \succ y_0$, in which case I^* is an admissible set. Q.E.D.

An Interorganizational Analysis of Power, Conflict, and Settlements in Public Sector Collective Bargaining

JAMES L. PERRY and CHARLES H. LEVINE
University of California, Irvine *Syracuse University*

The dramatic growth of unionism and collective bargaining in the public sector signifies a drastic departure from previous conceptions of the public employment relationship and previous patterns of public employee activity.[1] Concomitant with the rise of public sector unionism has been the increased interest social scientists have exhibited in the determinants of power, conflict, and outcomes in public sector collective bargaining. Despite increased scholarly interest, however, attempts at theory construction have fallen short because there has been a tendency to use conventional language consistent with the common discourse that occurs in the actual collective bargaining process; many scholars in the field have viewed idiographic orientations as the only means of validly approaching the subject; and the field has been dominated by scholars seeking melioristic solutions to employee relations problems in their research rather than focusing on theory building.[2]

In order to better understand public sector collective bargaining and to build theory about the phenomena, we need to develop a theoretical framework that allows for the systematic testing of propositions. Interorganizational theory, one approach that appears fruitful for constructing such a theory, is used in this study to capture major properties of the structure of public sector collective bargaining and to present and test some derived hypotheses. These hypotheses are tested with data gathered from a sample of 60 case studies of public sector collective bargaining in New York City from 1968 to 1972.

Theoretical Considerations

A public organization may be viewed as a coalition of individuals, "some of them organized into subcoalitions," whose "members include administrators, workers, appointive officials, elective officials, legislators, judges, clientele, interest group leaders, etc."[3] Drawing boundaries around the organizational coalition is difficult because organization members play a variety of roles. Nevertheless, the concept of organizational coalition can be simplified by

[1] One observer notes that in 1955 "the subject of labor relations in public employment could not have meant less to more people, both in and out of government." See Ida Klaus, "The Emerging Relationship," *Collective Bargaining in the Public Service*, ed. D. H. Kruger and Charles F. Schmidt, Jr. (New York: Random House, 1969), p. 11. Within 15 years, 2.3 million government employees held union membership and an additional 1.7 million government employees were members of associations, often functioning indistinguishably from unions. Municipal employees are represented for bargaining purposes by unions or associations in more than 1,300 communities. For statistics on the extent of public employee unionization and strike activities, see Tax Foundation, New York, *Union and Government Employment* (New York: Tax Foundation, May 1972), Tables 1 and 2, pp. 8–9, and Table 10, p. 29, and Richard H. Nelson and James L. Doster, "City Employee Representation and Bargaining Policies," *Monthly Labor Review*, 95 (November, 1972), 43–50. For a comparison of union and association behavior in the field of public education, consult J. Douglas Muir, "The Strike as a Professional Sanction: The Changing Attitude of the National Education Association," *Labor Law Journal*, 19 (October, 1968), 615–627.

[2] Scholars have adopted a number of approaches in their efforts to describe and explain conflict and outcomes in public sector collective bargaining. Liston, for example, attempts to explain the causes of public employee strikes merely by asserting that government workers in the lower classifications want higher salaries. See Robert A. Liston, *The Limits of Defiance: Strikes, Rights and Government* (New York: Franklin Watts, 1971). Wellington and Winter, in *The Unions and the Cities* (Washington, D.C.: The Brookings Institution, 1971), Chapter 1, employ a conceptual framework which assumes "a municipality with an elected city council and an elected mayor who bargains with unions representing the employees of the city." The conceptual framework is for the most part undefined and unaccompanied by indicators or constructs for its operationalization. Drotning, Lipsky, and Foster take a broad positivist approach to public sector collective bargaining. The outcome of interest to Drotning et al. is the mode of conflict resolution — mediation, fact-finding or conciliation. Although the authors fail to operationalize their approach, a more fundamental problem is the absence of any formal explication of the theoretical relationships underlying the variables. See John Drotning, David Lipsky, and Howard Foster, "The Analysis of Impasse Procedures in Public Sector Negotiations," *Management of Personnel Quarterly*, 9 (Summer, 1971), 21–30. For one of the more promising recent attempts to explain conflict see Thomas A. Kochan, "A Theory of Multilateral Collective Bargaining in City Governments," *Industrial and Labor Relations Review*, 27 (July, 1974), 525–542.

[3] Richard M. Cyert and James G. March, *A Behavioral Theory of the Firm* (Englewood Cliffs, N.J.: Prentice-Hall, 1963), p. 27.

identifying coalition members for certain classes of decisions and for specified periods of time.[4] An organizational coalition may be distinguished from its various subcoalitions by the degree of autonomy it exercises in decision making and goal setting. A subcoalition's decisions are influenced by legitimated authority within a hierarchical structure of which the subcoalition is an integral part. In interorganizational relationships, on the other hand, "the individual decisions of two or more units are made on a more inclusive systemic level which includes these units."[5]

The establishment and perpetuation of an organizational coalition rests on an equilibrium between member contributions and organizational inducements.[6] For individual workers the inducements/contributions contract has both short-term and long-term implications. Thompson writes:

> Clearly there is a *quid pro quo* theme to the inducements/contributions contract, for it defines what is expected of individuals in terms of jobs needing to be done, and it defines the rewards which the organization pledges for the appropriate performance of such jobs. . . . As a unit in his career, the job provides the individual with an arena or *sphere of action* in which to seek solutions to his career problems, and thus to meet the demands placed on him by the social system.[7]

March and Simon note that each participant will continue his participation in an organization only so long as the inducements offered him are as great or greater than the contributions he is asked to make. They assert: "Where the contract is viewed as unchangeable, the only options are 'accept' or 'reject'."[8] In cases where the contract is viewed as changeable, however, the motivation of individuals to protect or enhance their "sphere of action" is reflected in the negotiation of inducements/contributions contracts.[9]

Since the action spheres presented by jobs differ, they require different strategies for the negotiation of the inducements/contributions contract.[10] Collective bargaining may be viewed as a special (though not uncommon) strategy for the negotiation of the inducements/contributions contract. Thompson emphasizes that "the content of the inducements/contributions contract is determined through power (political) processes."[11] Conceived as the dependence of the parties relative to one another,[12] the power of the individual in "routinized technologies" and "early-ceiling occupations" is severely limited in negotiation of the inducements/contributions contract.[13] Nonetheless, when there exist large numbers of individuals in similar occupational roles, opportunities develop for collective action as a strategy of negotiation. Under these conditions, the problems of defining and enforcing the employment contract become a matter of concern for all organizational participants:[14] "The higher wages, shorter hours, and better working conditions that unions demand are collective goods to the workers."[15]

Collective bargaining involves a transformation of the basic structure of the public organizational coalition. Rather than the individual negotiating for the protection and enhancement of his job, negotiation is pursued through the formation of a new and distinct organization.[16] For purposes of analyzing collective bargaining the employee union can be considered an autonomous organization, free from the decision-making constraints of an overarching organization, and sharing in the formation of policies that determine the public employment relationship. The operation of neither organization, however, can be understood merely as an aggregation of the goals of its members. Coleman writes: "The actions of a trade union and other mass-based collectives are not always toward goals collectively held, but the very existence of the collectivity is based upon action toward collective goals."[17]

To account for collective goals, Thompson suggests conceptualizing goals as the "future domains intended by those in the dominant

coalition."[18] An organization's domain may be viewed as the claims which an organization stakes out for itself in terms of (1) range of products, (2) population served, and (3) services rendered.[19] The dominant coalition is conceived by Thompson as a subgroup of "interdependent individuals who collectively have sufficient control of the organization's resources to commit them in certain directions and withhold them from others."[20] In collective bargaining, two dominant coalitions each act to preserve or expand their domains through negotiation over the content of the inducements/contributions contract.

From this interorganizational relationship comes *conflict* and *contractual change*, and these are related to the nature of *goal divergencies, dependencies*, and the degree of *stability* in the relationship between the two organizations.

Following Cyert and March, the amount of *goal divergence* in the collective bargaining relationship can be understood in terms of the dimensions of each organization's goals (the future domains they view as important) and the strength of their preference for a particular outcome on a goal dimension.[21] The strength of an organization's preferences represents its "aspiration level" on any particular goal dimension. The organization's past goals, its past performance, and the past performance of other "comparable" organizations contribute to the organization's goal dimensions and aspiration levels.

In interorganizational relationships, power resides implicitly in the dependencies of organizations on one another. Pugh et al. focus on *organizational dependence* in the following manner: "The dependence of an organization reflects its relationships with other organizations in its social environment, such as suppliers, customers, competitors, labor unions, management organizations, and political and social organizations."[22] Within the environment of the union and the public organization exist a set of power-dependence relations—what Dill terms "task environment"—those actors in the environment which are relevant to goal attainment.[23]

Net power then results from a set of relationships between the organization and the elements of its pluralistic task environment. This admits the possibility that in collective bargaining the public organization may be powerful in relation to the union but dependent on other actors in its task environment to enforce its claims to domain. Thus, it becomes important for the organization to judge the amount and sources of support that can be mobilized for its goals, and to arrive at a strategy for their mobilization.

Although the public organization and the union organization negotiate a contract periodically, they must deal with each other continuously in handling disputes arising during the administration and interpretation of the contract. Walton and McKersie contend that the pattern of interaction between the organizations during contract administration directly influences the attitudes between the units that later affect contract negotiations.[24] Confined to the dyadic relationship between the union and public organization, *stability* refers to the degree to which prior structural features of the relationship expand or contract the capacity for joint decision making during collective bargaining.

In light of this distinction, the degree of stability in the relationship between the union and the public organization may be viewed as a product of the interactions between the two organizations prior to the initiation of contract negotiations. The interactions between the organizations during contract administration affect the development of the capacity for collaboration during contract negotiation by influencing the pattern and quality of information exchanged between the parties.[25] Also, the interactions prior to collective bargaining, directly influence attitudes between the parties which in turn determine how the organizations

view the continuity of the contract administration and contract negotiation phases of the relationship.[26]

These situational phenomena—goal divergence, stability, and organizational dependence—are conceptually distinct from the behaviors of the individual members of the union and public organization and affect the degree to which interorganizational behavior is oppositional, that is, the extent to which conflict takes passive or aggressive forms. This conceptualization of *conflictual behavior* is intended to encompass the whole range of oppositional behavior from manifest forms of "strategic maneuvering" to covert forms of passive resistance.[27] Within the interorganizational decision-making process, oppositional behavior may be triggered by either acts of the other organization or changes in situational contexts.

The collective agreement that terminates negotiations between the public and union organizations comprises the inducements/contributions contract agreed to during the collective bargaining process. The inducements/contributions contract represents a set of decisions of two individual organizations at a more inclusive systemic level because the organizations jointly establish their domains with regard to the public employment relationship until the negotiation of a new agreement. *Contractual change* refers only to the changes in the content of the inducements/contributions contract negotiated from the conclusion of one agreement to the conclusion of the subsequent agreement through the collective bargaining process. Inducements include such items as salary levels, monetary fringe benefits, union security provisions, and the control of the physical and health-related environment of the workplace. Although often implicit in the employment relationship itself and only suggested in the management rights clause, contributions items frequently specified in the contract include the length of the workweek, the residual rights of management, the grounds for disciplinary actions, and descriptions of job duties.

Table 1. Theoretical Definitions

Goal Divergence:
The degree of incompatibility between the goals of the union and public organization.

Stability:
The degree to which prior structural features of the relationship expand or contract the capacity for joint decision making during collective bargaining.

Organizational Dependence:
The degree of support from the task environments of the negotiating organizations.

Conflictual Behavior:
The degree of behavioral opposition between the union and public organizations during collective bargaining.

Contractual Change:
The degree of change in the content of the inducements/contributions contract.

Propositions and Operational Linkages

With the groundwork laid through the introduction of the interorganizational analytic framework, some of the concepts may be interrelated via formal theoretical statements. Preceding each proposition is a statement of the theoretical linkages and premises, and following each proposition is an exposition of supportive empirical evidence and the hypothesized operational linkages.

I. The choice of tactics for pursuing incompatible goals is likely to be influenced by the nature and radicalism of each organization's goals.[28] While goal divergence identifies the state of incompatibility or opposition between forces, the degree of conflictual behavior characterizes the behavioral outcome of the interactions between the organizations. The relationship between these concepts is not merely unidirectional since the escalation of conflict can be expected to influence the nature of the goal divergencies. As conflictual behavior escalates, there is a greater tendency for participants to associate only with those similarly oriented to the issues. This form of social support strengthens individual organizational members, highlights the incompatibility of goals, and solidifies the divergence of positions.

These relationships between goal divergence and conflictual behavior are particularly relevant for understanding strike behavior.[29] The union views the strike costs as costs to be recouped and revises its aspirations upward in an attempt to offset the costs of the strike. In response to the union action, management's resolve to avoid concessions on certain goal dimensions is likely to increase, and management may even be inclined to withdraw earlier concessions.

[29] See Walton and McKersie, *A Behavioral Theory of Labor Negotiations,* pp. 56–57 for an extended discussion of this point.

Proposition I. In public sector collective bargaining, the greater the goal divergence, the greater the conflictual behavior; as conflictual behavior increases, goal divergence also increases.

Empirical and experimental evidence from Axelrod, Bell, and Deutsch and Kraus is supportive of the plausibility of the two-directional theoretical relationship between goal divergence and conflictual behavior.[30] The operational linkage for Proposition I is hypothesized to be a positive, S-curve relationship. When the degree of goal divergence is minimal, some conflictual behavior may exist, but not a sufficient amount to produce feedback consequences. At intermediate levels of goal divergence, a nearly linear relationship between goal divergence and conflictual behavior is anticipated. Goal divergence may further increase while the degree of conflictual behavior has approached or reached an upper limit, thus accounting for a leveling off in the operational linkage.

II. Schelling writes that bargaining necessitates some kind of collaboration or mutual accommodation even if only in the avoidance of mutual disaster.[31] The time and effort required by the public and union organizations to form mutually consistent expectations, the nature of the expectations, and the capacity to communicate or to destroy communication in collective bargaining depends on the stability of the relationship developed during interaction in administering the collective agreement.

In analyzing interunit conflict in organizations, Walton proposes that more flexible and informal decision rules and less frequent recourse to the use of outside arbiters is likely to increase the capacity for collaboration in joint decision making between the units.[32] The development of mutual attitudes toward one another is a product of the degree of positive or negative affect between the organizations throughout their relationship. It is during interaction in contract administration that the organizations develop mutual expectations, attitudes, and decision rules relevant to their later behavior during collective bargaining. It is this structure of interorganizational interactions which expedites agreement or, conversely, hinders agreement and the control of conflictual behavior during collective bargaining.

Proposition II. In public sector collective bargaining, the lesser the stability during contract administration, the greater the conflictual behavior during negotiations.

Newcomb; Loomis; Bixenstine, Levitt, and Wilson; and Hammond et al. provide experimental results that support this proposition.[33] Lincoln's case analysis of the 1966 New York City Transit Authority negotiations identifies instability in the system as an explanatory variable, for the strike which subsequently occurred.[34] Pruitt, in a theoretical analysis of stability between pairs of national decision-making units,[35] suggests that the operational linkage between stability and conflictual behavior may be a step function; i.e., when the level of stability reaches a critical state, it causes the likely degree of conflictual behavior to change radically. The operational linkage at the interorganizational level of analysis, however, is more likely to be a power function.

III. Within the context of public sector collective bargaining, the choice of negotiation strategies and the employment and timing of particular commitment tactics for the attainment of new organizational domains will depend upon the support each organization obtains within its task environment. The amount of asymmetry between the dependence positions of the organizations influences the success of strategic choices and in turn the degree of behavioral opposition.

Small imbalances in relative dependence continually reinforce the need for cooperation by highlighting the interdependencies of the

[30] Robert Axelrod's investigation of a series of situations in politics confirmed his hypothesis that the greater the conflict of interest in a strategic interaction, the greater the conflictual behavior. See Robert Axelrod. *Conflict of Interest* (Chicago: Markham Publishing, 1970); see also Inge Powell Bell, *CORE and the Strategy of Non-Violence* (New York: Random House, 1968), p. 59; and Morton Deutsch and Robert M. organizations. As the asymmetry of relative dependence increases, the likelihood increases that persuasion as a means for reaching agreement will fail, stimulating greater behavioral opposition in the modes of transaction between the organizations. Large differences in relative dependence invite the stronger of the organizations to use coercion against the weaker organization to expand its domain. On the other hand, refusal by the stronger organization to make changes requested by the weaker organization stimulates greater conflictual activity by the weaker organization.

Proposition III. In public sector collective bargaining, the greater the asymmetry of relative dependence between the negotiating organizations, the greater the conflictual behavior.

Narrative and empirical support of the proposition is provided in studies by Terhune, Kerr and Siegel, and Zinnes.[36] A negatively skewed, positive curvilinear operational linkage is expected because beyond a certain level of asymmetry of relative dependence the likelihood of conflictual behavior is considerably reduced. Where an organization is so limited by its dependence position that it very nearly ceases to operate as an independent unit, the likelihood of conflictual behavior rapidly declines.

IV. The more substantial or encompassing a conflict, the greater the pressures from third parties for its solution.[37] In the public sector, as conflictual behavior persists or increases, efforts to arrive at agreement and achieve finality in the collective bargaining process generally lead to mediation or factfinding mechanisms. Concurrent with this phenomenon is the fact that as conflictual behavior between the union and public organization increases, agreement is less likely to be achieved by voluntary concession and reduction in demands. The anticipation of third party intervention may stimulate marginal concessions by the organizations and actual third party intervention may legitimate or require further concessions.[38] Thus, as conflictual behavior increases, the process is likely to produce greater change in the inducements/contributions contract.

Proposition IV. In public sector collective bargaining, the greater the conflictual behavior, the greater the contractual change.

Little empirical research has been undertaken to assess the plausibility of this proposition. However, one study of the effect of impasse during collective bargaining on negotiated salaries of teachers found better mean salary gains in some impasse districts.[39] The proposed relationship is expected to be clearly evident if all dimensions of the collective agreement are analyzed. The operational linkage between conflictual behavior and contractual change should be positive and linear. The slope of the function is expected to be substantially less than unity.

V. When it comes to a test of strength, the organization that can mobilize the most resources and trade on relationships within its task environment should achieve a more advantageous outcome. Even the expectation of losing at some future time may encourage the weaker organization to search for an immediate solution or offer a favorable concession to the stronger organization. The degree of imbalance in their relative strength is likely to affect the amount of the concessions that the weaker organization will have to offer in order to extract lesser concessions from the stronger organization or to reach final agreement. Since demands are almost always initiated by the union, changes in the contract will usually take the form of concessions to the union.

Proposition V. In public sector collective bargaining, the greater the asymmetry of relative dependence favoring the public organization, the lesser the contractual change; the greater the asymmetry of relative dependence favoring the union, the greater the contractual change.

This proposition is consistent with Gamson's theoretical analysis[40] and is supported in Rapoport's and Orwant's review of experimental games, particularly those of Flood and Caplow.[41] Lammers likewise found a strong

relationship between relative strength of the parties and outcome.[42] The trace line for the operational linkage between relative dependence and contractual change should resemble a negatively sloping S-curve; the relationship is also expected to exhibit both upper and lower limits.

A diagrammatic summary of the theoretical relationships is presented in Figure 1; Table 2 presents a summary of the operational linkages. The broken lines in Figure 1 depict feedback between the outcome of the collective bargaining process in one period and its effect upon the variables in the succeeding period.[43] Because conflictual behavior is caus-

[42] Cornelius J. Lammers, "Strikes and Mutinies: A Comparative Study of Organizational Conflicts Between Rulers and Ruled," *Administrative Science Quarterly*, 14 (December, 1969), 558–572. A laboratory simulation of interparty exchange during labor negotiations tested the effects of varying the level of social cues during negotiations on the outcome of bargaining. Increases in the level of social cues favorable to the union positively influenced the level of contractual change; social cues favorable to management led to a reverse outcome. See Ian R. Morley and Geoffrey M. Stephenson, "Interpersonal and Interparty Exchange: A Laboratory Simulation of an Industrial Negotiation at the Plant Level," *British Journal of Psychology*, 60 (November, 1969), 543–545.

Table 2. Summary of Operational Linkages

Relationship	Direction	Type	Limit
Goal Divergence and Conflictual Behavior	positive	S-curve	upper
Stability and Conflictual Behavior	negative	power	none
Asymmetry of Relative Dependence and Conflictual Behavior	positive	negative skew, curvilinear	none
Conflictual Behavior and Contractual Change	positive	linear	none
Asymmetry of Relative Dependence favoring one of the organizations and Contractual Change	negative	S-curve	upper and lower limits

ally dependent on goal divergence, stability, and asymmetry of relative dependence but causally prior to contractual change, it is depicted as an intervening variable in Figure 1.

Methodology

The practice of collective bargaining in the public sector has not triggered a bounty of empirical studies which have accumulated large bodies of comparative data. The dearth of research in this field partly stems from the realities of public sector collective bargaining and from the nature of measurement problems associated with the most relevant variables. These problems indicate that relatively inexpensive data collection procedures like the analysis of available aggregate data sets would be inadequate to test the propositions presented in this paper. To provide an appropriate setting to test the model, we had to select a field site with an adequate population of cases for the selection of a sample of cases, adequate archival records for the measurement of the variables, and a uniform legal and political framework within which collective bargaining takes place. For these reasons, the tests of the hypotheses focused on a cross-sectional analysis of public sector collective bargaining in one large municipality, New York City.

Collective Bargaining in New York City. In 1958, with the issuance of Executive Order No. 49, Mayor Robert Wagner initiated a program to implement collective bargaining practices prevailing in the private sector.[44] Horton writes: "The executive order quickly was dubbed the 'Little Wagner Act' and the city's civil service leaders called it their 'Magna Carta.' In retrospect, however, the City's new labor relations program hardly deserved these appellations."[45]

Collective bargaining procedures were altered in 1967 by Executive Order No. 52 which established independent, impartial tribunals to settle disputes arising in contract negotiations, contract administration, and representation elections.[46] Simultaneously, the New York State Legislature passed the Public Employees Fair Employment Act (Taylor Law) which exempted New York City from the jurisdiction of the State Public Employment Relations Board (PERB) on the condition that its system for collective bargaining be "substantially equivalent."[47] Thus, City policies were modified in accordance with the provisions of the Taylor Law to parallel State guidelines more closely.[48]

Sayre and Kaufman's contention that "no single ruling elite dominates the political and governmental system of New York City"[49] is characteristic of its labor relations activities. A multiplicity of public officials and agencies are involved in New York City government labor relations: the mayor, agency personnel, the Office of Labor Relations, the Office of Collective Bargaining, the Bureau of the Budget, the Department of Personnel, the City Council, and the Board of Estimate.[50] The governor and the State legislators are also occasional participants in City labor relations policy making.[51]

While the Office of Labor Relations provides the professional expertise in contract negotiations,[52] it is the Office of Collective Bargaining (OCB) that can be considered the governmental "core group."[53] The OCB is a tripartite board consisting of two members appointed by the mayor, two members appointed by a committee of municipal union leaders, and three members selected by unanimous vote of the mayoral and union appointees. The primary function of the OCB is the resolution of bargaining impasses. The Board of Certification, composed of three of the seven OCB members, is responsible for certifying employee bargaining representatives. In addition, arbitrability of grievances is de-

[50] Horton, *Municipal Labor Relations in New York City*, p. 12.

[51] *Ibid.*

[52] The Office of Labor Relations was created by Mayor Lindsay in 1966. Its primary function is to represent the City government and units within its jurisdiction in collective bargaining. For an inside view of its operations see Anthony C. Russo, "Management View of the New York City Experience," *Unionization of Municipal Employees*, ed. Robert H. Connery and William V. Farr, (New York: The Academy of Political Science, Columbia University, 1971, pp. 80–93.

[53] Sayre and Kaufman, *Governing New York City*, p. 710.

termined by all OCB members in their role as the Board of Collective Bargaining.[54]

When the Office of Collective Bargaining started operations in January, 1968, there were approximately 400 bargaining units in existence.[55] Through consolidation of units, the number of bargaining units was reduced to 325 by 1971.[56]

The choice of New York City as the locus of research creates some dilemmas because New York's city government often is considered *sui generis* by researchers. It is larger and possibly more complex than any other United States city government.[57] The weight of several other factors, however, outweighed these considerations in the selection of New York City as the research site. First, a limited geographic area provided the opportunity to gather information that, dispersed over a larger region, would have been too costly and time consuming to collect. Second, testing the model on a sample of New York City cases did provide an opportunity to disconfirm the propositions, a consideration that took precedence over concern with external validity. Finally, where a comprehensive legal framework for public employment collective bargaining has been adopted by state and local jurisdictions, there tends to be marked similarities in statutory provisions.[58] Therefore, no compelling reason exists for contending *a priori* that an explanatory model tested on cases of public sector collective bargaining in New York City would be less valid for other settings with a comprehensive statutory framework.

Sample Selection. Specification of the population was achieved through the collection of comprehensive lists of collective bargaining settlements in New York City. A set of master lists,[59] prepared by the New York City Office of Labor Relations (OLR), contained identifying and descriptive information on collective bargaining settlements between New York City governmental units and various unions representing public employees from 1968 through 1972. Three sources, containing lists of public employee work stoppages during this period, were also consulted to assure that these cases were included on the master lists.[60] As a result of this process, the population encompassed 535 collective bargaining settlements.

The next step toward selecting the 60-case research sample was to identify the level of conflict during negotiations so that the population could be stratified. To achieve this objective, several sets of documents were consulted. First, the lists of public employee work stoppages were again utilized.[61] Second, all cases in which impasse, fact-finding, or mediation occurred were identified.[62] Third, *The New York Times Index* was utilized to identify negotiations, strikes, settlements, and other activities that may have been reported in *The New York Times*. Fourth, several civil service and local union publications proved to be valuable sources. *The Chief* and the *Civil Service Leader*, publications covering topics of general interest to civil service employees, provided information on a wide range of cases within the population; and the local publication of the AFSCME, *Public Employee Press*, yielded valuable information pertaining to many additional cases in the population. Stratification was based on a four category scale. Different

conflict acts served to define minimum inclusion levels for each group. Group 1 included all cases where no conflictual acts were observed. Group 2 included cases in which impasses occurred but in which no overt conflictual acts were observed. Group 3 included all cases in which overt acts short of a strike were observed. Group 4 included all cases in which a strike did occur. Once stratification of the population had been completed, the final step in specifying the sample was to select 15 cases randomly from each of the four groups.[63]

Operational Measures

The indicators for each of the concepts defined in Table 1 are presented below. Because most of the indicators were developed specifically for this study, little attention can be given to the empirical validity of the indicators as they have been used in previous studies.

Goal Divergence. The number of demands submitted by the union at the initiation of negotiations was selected as the indicator of goal divergence. This indicator was chosen over others primarily for advantages of data availability, ease of accessibility, and completeness. Using an unobtrusive indicator to measure goal divergence also circumscribed many of the difficulties which could have been encountered in attempting to measure the variable with reactive instruments.

Ideally, the number of initial public organization demands should have been considered also. For the population utilized here, however, there were approximately thirty demands general to all collective bargaining negotiations in New York City.[64] Since the content of the demands was not published or available from a sufficient number of the involved organizations so that further analysis could be performed, the number of initial union demands was considered adequate for cross-sectional analysis.[65]

While this indicator was assessed on an *a priori* basis for its face validity, there was little evidence for assessing its empirical validity.[66] From an appendix of data from Hammermesh,[67] a median test was performed on the divergence of wage proposals. Dichotomizing the cases on the basis of whether a strike did or did not occur, and computing the probability for the marginal totals in a 2×2 contingency table produced a significant relationship at alpha $= .05$. Although this evidence is not substantial, it does point to the empirical validity of using initial bargaining demands to measure goal divergence.

Relative Dependence. In Pugh et al.[68] the size of the organizational unit relative to its parent organization was utilized to measure dependence. Relative size was found to intercorrelate substantially with other dimensions of dependence: status of organization unit (.68), organizational representation on policy-making body (.50), specializations contracted out (−.60), and vertical integration (−.40).[69] Pugh et al. concluded from these results, and from low intercorrelations with the dimensions of other concepts, that this indicator does tap "aspects of the dependence of the organization, particularly its dependence on external resources and power. . . ."[70]

A second consideration was how to operationalize the variable to measure the difference in the amount of dependence between the organizations. The operationalization selected rested on an additive assumption. The dependence score for the union organization was subtracted from the dependence score for the public organization. Under this approach, asymmetry of relative dependence favoring one of the organizations theoretically ranges from a lower limit of −1 (most favorable to the union organization) to an upper limit of +1 (most favorable to the public organization). This indicator was used to test Proposition V. The absolute value of this indicator was used to test Proposition III since the amount of asymmetry alone, and not which organization was favored, was hypothesized to be the significant determinant of conflictual behavior.

Stability. In order to measure this concept, data on the number of grievance arbitrations filed and the number of employees in the unit were

[63] An appendix containing the cases analyzed, the affiliations of the employee groups, and the year in which negotiations were conducted is available upon request from the authors.

[64] Communication from John T. Burnell, Director, Office of Labor Relations, March 23, 1974. The initial number of union demands was also supplied by the OLR.

[65] The content of the demands would have been extremely useful for further analysis, but the lack of uniformity in maintaining these as records within organizations and the often sensitive nature of their content militated against obtaining them.

collected. Most of this information was available from the New York City Office of Collective Bargaining and Office of Labor Relations.[71] In cases where these data were not available from these sources, the data were obtained from union publications.

A time frame for isolation of the grievance arbitration data had to be selected so as to be compatible with the conceptualization of stability. The period beginning one year prior to the initiation of contract negotiations appeared to be an appropriate time span. Collecting grievance arbitration data for one year provided a sufficiently long, continuous span of time prior to negotiations to observe variance in the stability of relationship patterns.

The decision to utilize grievance arbitration data for the indicator of stability stemmed from several factors. First, grievance arbitration is generally recognized as an interorganizational mechanism for concerting the action of two or more organizations. Second, regarding the conduct of labor relations in New York City, Executive Order No. 52 required that "an employee organization certified for the unit of which the grievant is a member shall have the right to bring grievances unresolved at Step 2 of the general procedure . . . to impartial arbitration."[72] Third, previous research by Derber, Chalmers, and Stagner[73] suggested that the grievance process serves as a valid indicator of the stability of the labor-management relationship. Finally grievance arbitration data were easily accessible and inexpensive to collect.

Conflictual Behavior. Dubin points to the difficulty of developing adequate empirical indicators of conflictual behavior since "conflict behavior includes nonhomogenous acts . . ." and ". . . it is a major task to develop some measuring scale by which it is possible to equate a given number of units of personal abuse with the calling of a strike."[74] Dubin notes, however, that "some acts are more critical to the union-management relationship than others."[75]

Ivo and Rosalind Feierabend approach the measurement of conflictual behavior on the basis of observationally defined events representing different points on a scale.[76] Similarly, to analyze conflictual behavior in public sector collective bargaining, we chose to use a four-point scale, ranging from 1 (denoting absence of conflictual behavior) through 4 (denoting extreme conflictual behavior) to stratify the cases. Once the cases were selected, they were also ranked within the groups when distinctions could be made in the frequency or intensity of conflictual acts. The final scores for the cases ranged from 1 to 32.

Contractual Change. In scaling items within the contracts, weights were given to contract provisions on the basis of their increasing cost to the public organization or their favorableness to the union.[77] In the case of some contract provisions, the item was assigned a value of 0 or 1 depending on its presence or absence in the contract. For the remainder of the contract provisions, however, more specific ordinal scales were identifiable. By coding successive contracts on this basis, an index of contractural change was obtained by subtracting the values of the previous contract from those of the current contract. Despite an attempt to formulate an exhaustive set of provisions, it was unreasonable to assume that all provisions could be anticipated prior to analysis. Furthermore, some judgment was likewise exercised by the coder in assigning values to idiosyncratic provisions and deviations in particular contracts.

Findings

The operational relationships between the variables are examined graphically in Figures

[71] The number of employees in the bargaining unit was contained on the master lists used in sample selection. Most of the information on grievance arbitrations filed was obtained from internal records of the OCB.

2 through 7. Only the relationship between asymmetry of relative dependence and conflictual behavior deviates from the hypothesized relationships. On the basis of the graphic analysis, the relationships between conflictual behavior and stability and asymmetry of relative dependence were linearized, and a correlation matrix was computed for the entire set of variables. The correlation coefficients are displayed in Table 3.

Expectations about the relationship between the initial number of union demands and conflictual behavior are borne out by the substantial positive correlation with the indicator of conflictual behavior. The relationship between stability (decreasing) and conflictual behavior also exhibits a substantial positive correlation. When a transformation based upon the revision of the hypothesized operational linkage suggested by Figure 4 is employed, the relationship between asymmetry of relative dependence and conflictual behavior is found to be significant. The hypothesized relationships between conflictual behavior, relative dependence and contractual change also accord with our predictions.

In addition to the lack of support for the hypothesized relationship between asymmetry of relative dependence and conflictual behavior indicated by the zero-order correlations, the

first-order partial correlations (Table 4) indicate further difficulties in the original formulation of the relationships. The revised relationship between asymmetry of relative dependence and conflictual behavior and the relationship between stability and conflictual behavior are reduced below the .05 level of significance when controlled for goal divergence. Although stability remains significant at the .06 level, the reduction in the significance of the relationship between asymmetry of relative dependence and conflictual behavior is substantial. On the other hand, controlling for goal divergence does not substantially reduce the significance of the relationship between asymmetry of relative dependence and conflictual behavior when the direction of asymmetry is specified (i.e., the relationship between the actual rather than the absolute value of the asymmetry of the relative dependence variable and the conflictual behavior variable). In addition, when conflictual behavior is utilized as the control variable to test the independent effects of goal divergence and asymmetry favoring one of the organizations, both relationships remain significant well below the .05 level. We had expected the relationships between goal divergence and contractual change to be substantially reduced according to the original formulation.

Based upon these findings, Figure 8 (a and b) presents revised models of the determinants of conflictual behavior and contractual change. The major changes in the models are represented by the specification of the direction of the asymmetry in explaining conflictual behavior and the addition of the direct linkage between goal divergence and contractual change. The operational linkage of Figure 7 indicates that the level of conflictual behavior decreases as a linear function of management's dependence on the union. That goal divergence accounts for a substantial amount of the contractual change in the revised model can be explained in part by inadequacies of the indicator used to measure goal divergence. The initial number of union demands appears to represent not only the divergence, but also the convergence of goals. It is also not a good measure of what was termed the aspirational or strength of preference dimension of the concept. The relationship between goal divergence and contractual change may be inexplicably strong for these reasons.

Another interesting phenomenon surfaces when the contractual change index is broken down into the three dimensions of salary adjustment, nonsalary cost changes, and noncost changes.[78] Table 5 displays the correlations be-

[78] These categories correspond to the frequently used empirical distinctions among wages, fringe benefits, and other terms and conditions of employment. Different terminology is used here to reflect more clearly the inclusion criteria for each category. Those provisions other than wages and salaries which either

Table 5. Zero-Order Correlations Between the Explanatory Variables and Three Contractual Change Dimensions

Explanatory Variables	Contractual Change Dimensions		
	Salary Adjustment	Nonsalary Cost Items	Noncost Items
Goal Divergence	.162 (.109)	.497 (.001)	.513 (.001)
Asymmetry of Relative Dependence Favoring One of the Organizations	−.104 (.214)	−.407 (.001)	−.227 (.040)
Conflictual Behavior	−.065 (.309)	.385 (.001)	.368 (.002)

tween the explanatory variables and these three dimensions of the inducements/contributions contract. None of the explanatory variables correlates at a significant level with salary adjustment, although they all exhibit significant correlations for the other two dimensions of contractual change. At least two complementary interpretations may be posited to account for these relationships.

One of the interpretations involves the temporal aspect of the collective bargaining process in the public sector. Downing suggests that it makes "good common sense — when it comes to the question of wages and fringe benefits, you do not want to have seniority problems hanging fire."[79] The key to adducing the importance of timing in relation to the composition of the items in the inducements/contributions contract is suggested by Stevens:

> The agenda-related point of interest is that even though a number of items are on the "same" agenda, they may in a sense be accorded separate "forums." . . . The significance of the attempt to distribute items on the "same" agenda among separate forums by pressing for seriatim treatment is conditioned by a provision strongly implied by the package settlement rule: Any agreements or proposals relating to individual items made during the course of negotiations are understood to be provisional and may be withdrawn if final agreement upon all items in dispute is not reached. . . .[80]

The importance of these statements for the discussion at hand rests on several assumptions. First, collective bargaining in the public sector may be partitioned into at least three time periods, each associated with an appropriate forum: (1) pre-impasse, two-party bargaining; (2) impasse, mediated bargaining; (3) post-mediation, power bargaining. Second, the grouping of agenda items for seriatim treatment depends on the organizations involved and varies from situation to situation. Noncost items may, for example, normally be agreed upon first in negotiations, but the second assumption suggests that there is sufficient variation from case to case so that the items which represent subordinate differences will vary. Finally, any package settlement should be viewed as having an upper bound above which management will refuse to agree and a lower bound below which the union will refuse to agree.

Within this framework, the statistical relationships between the dimensions of the contractual change index and the explanatory variables can be more easily understood. For example, take the case in which the agenda orderings of the organizations are consonant and salary is agreed upon in the first time period. Assume that agreement on this item brings the organizations close to their settlement points. Even if bargaining proceeds beyond this forum, it seems unlikely that adjustments in the other time periods will substantially change the focus of settlement in the earlier period. Furthermore, early agreement on

entailed a direct fiscal outlay or for which cost calculations could be made were placed in the nonsalary cost category. Items such as tuition reimbursement, uniform allowances, and meal allowances were included in this category. Among the items included in the noncost category were provisions covering contracting out, transfers, physical working conditions, and posting of vacancies.

[79] Thomas G. Downing, "Strategy and Tactics at the Bargaining Table," *Personnel*, 37 (January/February, 1963), 44–45.

[80] Carl M. Stevens, *Strategy and Collective Bargaining Negotiations* (New York: McGraw-Hill, 1963), pp. 44–45.

salary does not preclude the importance of the explanatory variables in determining nonsalary cost and noncost outcomes in succeeding forums and time periods.

A second explanation relates to the visibility of salary adjustments and the proportion of the settlement allocated to each of the items in the inducements/contributions contract. The magnitude of the salary adjustment may vary inversely with the explanatory variables because of the need for the organizations to maintain or enhance future task-environment support. A weak union, for example, may pursue a large wage increase in preference to other inducements because of the immediate and visible gains its leaders are able to provide its rank-and-file members. Conversely, once the salary demands of strong unions become publicly visible it may be necessary for them to accept other, less visible inducements so that their current gains are not translated into loss of support in the future.

Conclusions

A summary of findings on the original theoretical propositions and operational linkages is presented in Table 6. Although these results do not advance our understanding of public sector collective bargaining processes sufficiently to draw any firm conclusions beyond the scope of the research, three areas of practical implication are suggested to us by this research: the need to give greater emphasis to public interest considerations in the collective bargaining process; the consequences of collective bargaining for internal resource allocation in public organizations; and the utility of the model for evaluating alternative policies or policy changes.

The research indicates that perhaps the scope of the public interest is too narrowly defined in the collective bargaining process. In the bilateral structure of negotiations the broader needs of the community tend to be ignored. As Kochan notes: "The issue which now must be confronted is how to devise a bargaining system for municipal employees which insures them the rights of 'first class citizenship' and still provides a voice for the pluralistic interests of the community."[31]

A second area of practical implication, related to public interest considerations, is the consequences of collective bargaining for the allocation of resources among subunits of the public organization. When the outcome of public sector collective bargaining tends to allocate scarce governmental resources according to union power, severe wage and benefit imbalances can develop which may have serious programmatic and personnel consequences. For example, program outputs may be reduced in one agency to maintain wage and benefit levels in another. Also, the betterment of working conditions for employees in some units may be

Asymmetry of Relative Dependence Favoring One of the Organizations and Contractual Change	Confirmed	Negative	S-curve	Upper and lower limits	Negative	S-curve	Upper and lower limits

reflected in the resentment and lower morale of employees in other units.

The model could also be useful for evaluating alternative policy prescriptions. For example, a policy change designed to control the scope of bargaining could be evaluated on the basis of how it affects the values of the goal divergence variable over time. Similarly, the comparative effectiveness of state collective bargaining policies for state and local government employees could be evaluated on the basis both of how the policies affect the distributions of the explanatory variables and of how they limit the degree of conflictual behavior.

The greater part of the impact of collective bargaining on government operations and the public employment relationship most certainly lies in the future. It will probably be another decade before the rapid growth of public employee unionism slows appreciably. In the meantime, collective bargaining is bound to continue growing in use and evolving with experience. A disconcerting prospect is that collective bargaining in the public sector will continue to evolve toward the private sector model without adequate consideration being given to the differences in the two settings.[82]

[82] For a discussion of some of the contextual differences between collective bargaining in the public and private sectors, see George H. Hildebrand, "The Public Sector," *Frontiers of Collective Bargaining*, ed. John Dunlop and Neil Chamberlain (New York: Harper and Row, 1967, pp. 125–154; David T. Stanley, *Managing Local Government Under Union Pressure* (Washington, D.C.: The Brookings Institute, 1972); Harry Wellington and Ralph K. Winter, Jr., *The Unions and the Cities;* and Gerald M. Pops, "A Decisional Analysis of Grievance Arbitration in the Public Sector" (Ph.D. dissertation, Maxwell School, Syracuse University, 1974).

Hollow Victory: The Minimum Winning Coalition*

RUSSELL HARDIN

University of Maryland, College Park

Introduction

More than a century ago, in 1868, former Representative Ransom Gillet (Democrat of New York, 1833–37) recalled that

> the way to enact a tariff bill was to provide protection for the local interests of enough representatives to ensure the bill's passage. "Interest and not principle," he said, "determines what shall be done. If votes from Louisiana and Texas are needed, sugar will come in for favor. If support is needed from Illinois, Wisconsin, Minnesota and Michigan, lead, copper and pine lumber are provided for. If the votes of Pennsylvania are wanted, coal and iron receive full attention. . . . The principle of protection under a tariff never expands beyond the objects necessary to carry a bill."[1]

In *The Theory of Political Coalitions*, William Riker proposed his "size principle," according to which: "In n-person, zero-sum games, where side-payments are permitted, where players are rational, and where they have perfect information, only minimum winning coalitions occur."[2] Riker's proof of the principle uses a clever incentive argument which allows him to escape from the morass of game theoretic solution theory. Over the past decade, the size principle has entered theoretical analyses as a basic assumption,[3] and it has spawned numerous empirical studies.[4] It

* I am grateful to the students of my spring 1973 graduate seminar in formal analysis in the Department of Political Science, University of Pennsylvania, for giving me cause to pursue the topic of this paper. I am also grateful to several colleagues for discussing the ideas in the paper at times when they hardly deserved inclusion in the class of ideas. William H. Panning especially deserves thanks for his criticisms and suggestions, and for calculating the probabilities of coalitions by size in a random legislature. William L. Ascher, Charles D. Elder, Edwin T. Haefele, Jack H. Nagel, Joe A. Oppenheimer, Dennis H. Paranzino, Kenneth A. Shepsle, Jeff Smith, Oran R. Young, and an anonymous reviewer — who together must constitute a winning coalition in some realm — all read earlier drafts of the paper and recommended extensions, revisions, and additional literature.

[1] *Guide to the Congress of the United States* (Washington, D.C.: Congressional Quarterly Research Service, 1971), p. 607.

[2] William H. Riker, *The Theory of Political Coalitions* (New Haven: Yale University Press, 1962), p. 32. The original presentation of the proof of the principle, at pp. 247–278, is somewhat involved. I will therefore generally refer to the briefer, clearer presentation in William H. Riker and Peter C. Ordeshook, *An Introduction to Positive Political Theory* (Englewood Cliffs, New Jersey: Prentice-Hall, 1973), pp. 176–187. This later presentation is eminently accessible to anyone who has even limited patience for game-theoretic algebra. See also Riker, "A New Proof of the Size Principle," in *Mathematical Applications in Political Science*, II, ed. Joseph L. Bernd (Dallas: Southern Methodist University Press, 1966), pp. 167–174.

[3] Lawrence C. Dodd, "Party Coalitions in Multiparty Parliaments: A Game-Theoretic Analysis," *American Political Science Review*, 68 (September 1974), 1093–1117; Edwin T. Haefele, "Coalitions, Minority Representation, and Vote-Trading Probabilities," *Public Choice*, 8 (Spring 1970), 75–90, and "A Utility Theory of Representative Government," *American Economic Review*, 61 (June 1971), 350–367; Richard G. Niemi and Herbert F. Weisberg, "The Effects of Group Size on Collective Decision Making," in *Probability Models of Collective Decision Making*, ed. Niemi and Weisberg (Columbus, Ohio: Merrill, 1972), pp. 125–148; and Bruce M. Russett, "Components of an Operational Theory of International Alliance Formation," *Journal of Conflict Resolution*, 12 (September 1968), 285–301. See further the book length manuscript of Steven J. Brams, "Coalition Dynamics: Models of Coalition Formation in Voting Bodies" (New York University, 1971, mimeo.), esp. chapters 1 and 3.

[4] Most of the contributions to *The Study of Coalition Behavior*, ed. Sven Groennings, E. W. Kelley, and Michael Leiserson (New York: Holt, Rinehart and Winston, 1970), either apply the size principle or discuss its relevance to various empirical problems. Michael Leiserson, "Factions and Coalitions in One-Party Japan," *American Political Science Review*, 62 (September 1968), 770–787, finds that the size principle fits coalition formation in the conservative Japanese Liberal-Democratic Party. David H. Koehler, "The Legislative Process and the Minimal Winning Coalition," in Niemi and Weisberg, pp. 149–164, argues that the size principle explains roll-call voting behavior in the United States House of Representatives. David W. Rohde, "A Theory of the Formation of Opinion Coalitions in the U.S. Supreme Court," in Niemi and Weisberg, pp. 165–178, applies the principle to Supreme Court decisions. Markku Laakso, "Riker's 'Size Principle' and Its Application to Finnish Roll-Call Data," *Scandinavian Political Studies*, 9 (1972), 107–118, applies the principle to a multiparty parliament.

Further references are given in Riker and Ordeshook, *Positive Political Theory*, pp. 192–194. In addition, Riker presents anecdotal evidence in support of the size principle from the collapse after victory of the wartime grand coalitions of 1815, 1917, and 1945; from the American presidential elections of 1824 and 1964–1968; and from the collapse after victory of recent national independence movements in colonial states. See further, *Positive Political Theory*, pp. 188–191, 194–196, and 199–201; and Riker, *Political Coalitions*, chap. 3.

has also been subjected to serious criticism.[5]

In what follows I will argue that, contrary to Gillet's common sense and Riker's game theory, the size principle should be expected to fail in application. The first part of the argument will be that the range of the theoretical validity of the principle is far more restricted than is apparent from Riker's proofs and discussions of it. In particular, it is valid only for a very narrow class of all zero-sum symmetric games (the class of supersymmetric games, which will be defined below) and for a similarly narrow class of all zero-sum asymmetric games (which are vaguely the asymmetric equivalent of supersymmetric games). The incentive argument for the size principle fails for the more general classes of all symmetric and asymmetric games.

The second part of the argument will be more general and hence more succinct. It appears that any model which predicts a tendency toward minimum winning coalitions would be theoretically insignificant and empirically untestable for games in which n is very large, as for instance in the House of Representatives. This follows because in such games almost all winning coalitions which are possible will fall within a few per cent of minimal size merely by chance.

After briefly discussing the game theoretic context of the size principle, I will first address theoretical issues and then empirical issues. Throughout, the concern is exclusively with zero-sum games, but the zero-sum condition will not be constantly reiterated.

An *N*-Person Zero-sum Game. In order to facilitate discussion of the derivation of the size principle, it will be useful to refer to an actual game. On the other hand, in order to maintain the reader's patience, I will restrain the urge to create ever more beautiful games to demonstrate ever more beautiful points. Hence, the reader will be burdened with only one tedious game matrix.

Consider the 5-person zero-sum game whose payoffs are allotted by majority decision from the set of outcomes presented in cursory form in Game 1:

Game 1

Player	A	B	C	D	E
Outcome I	0	0	0	0	0
Outcome II	20	20	20	−10	−50
Outcome III	20	20	20	−50	−10

If all possible permutations on Outcome II are included, the game is symmetric.[6] The only restrictions on the payoffs are that they sum to zero; that the majority coalition will allot to its members payoffs which sum to the value of the coalition; and that the payoffs be subject to the constraint of individual rationality, that is, no player will accept less than his security level. The *security level* of a player is the best payoff which he can unilaterally guarantee for himself even against a coalition of all the other players. The security level of players in Game 1 is −50. The *value*, or *characteristic function*, of a coalition is the total payoff which the coalition can guarantee its members no matter what players outside the coalition do. The possible majority coalitions in Game 1 include ten 3-player coalitions, five 4-player coalitions, and one 5-player coalition. The value of each 3-player coalition is 60. The value of each 4-player coalition is 50. And the value of the 5-player grand coalition, of course, is zero. The value of coalition ABC is represented as v(ABC).

Symmetry in Games. In general a game is said to be *symmetric* if the value of a coalition is a function only of the number of players in it. For instance, in Game 1 above, all 3-person coalitions have a value of 60. All 1-person coalitions have a value of −50. The condition for symmetry will be met if the payoff configuration faced by one player is identical to that faced by every other player, in which case the game will be called *identically symmetric*. The condition of symmetry can also be met under other payoff configurations, as for example if three players must choose by majority agreement among the three outcomes (1,1,−2), (2, −2,0), and (−2,1,1). In this game, the 3-person coalition has the value of 0; all 2-person coali-

Young, "The Size of Winning Coalitions: A Note on Riker's Size Principle," unpublished manuscript (University of Texas, Austin, 1972, typescript).

[6] All possible permutations can be generated by switching the labels of the players through all orderings. With five players, these number 51, or 120 outcomes.

tions have the value of 2; and all 1-person coalitions have the value of −2. In this game, the payoffs are not symmetric, but the values of coalitions are.[7] In order to determine whether a game is symmetric, it is necessary to know only the characteristic function form of the game, i.e., the values of coalitions. To determine whether a game is identically symmetric, it is necessary to know much more — the full matrix of payoffs.

Riker's Assumption of Symmetry. Riker tacitly introduces symmetry when he presents the graphs of Figure 1, which plot the values of coalitions against their sizes. On the horizontal axis are the sizes of coalitions ranging from *m*, the minimal winning size, to *n*, the total number of players in the game. On the vertical axis are the values, or characteristic functions, of the coalitions. One should not be confused by the multiplicity of curves actually plotted — each curve simply represents a typical game. For example, the flat curve labeled II represents a game in which every winning coalition has the value (or collective payoff) γ, except that the grand coalition of all *n* players has the value 0 (because the game is zero-sum). The payoff to the corresponding losing "coalition" is always the negative of the payoff to the winning coalition.

A conspicuous point of these graphs is that they can be plotted as single-valued curves only if all coalitions of a given size have the same value, i.e., if the game is symmetric. If in Game 1 the only outcome possible were that presented as Outcome II without allowing permutations, then possible 3-person coalitions would have the values 60, 30, −10, and −40; and 4-person coalitions would have the values 50, 10, and −40. Hence, this restricted game cannot be fitted into Riker's graphs.

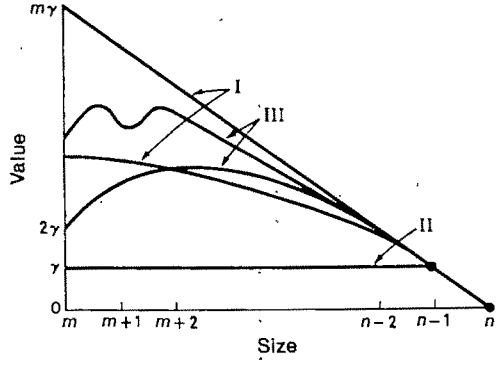

Figure 1. Size and Value of Winning Coalitions

From Riker and Ordeshook, *Positive Political Theory*, p. 181. Copyright 1973 by Prentice-Hall, Inc.

[7] A more striking example of a game whose *normal form*, or matrix of payoffs, is distinctly asymmetric but whose *characteristic function form* is symmetric was proposed by J. C. C. McKinsey, *Introduction to the Theory of Games* (New York: McGraw-Hill, 1952), pp. 351–353. The example is discussed in R. Duncan Luce and Howard Raiffa, *Games and Decisions* (New York: Wiley, 1957), pp. 190–191.

Butterworth's and Shepsle's Assumptions of Symmetry. Butterworth likewise tacitly introduces the condition of symmetry when he presents symmetric counterexamples to Riker's size principle, and when he refers to "games with a nonpositively-sloped characteristic function" such as those represented by curves I and II in Figure 1. In his proof of his own "maximum number of positive gainers" principle, he does not invoke or need the symmetry condition. But he concludes by suggesting that "a most desirable line of development is to generalize the analysis of [his] principle beyond simple symmetric games."[8] A simple generalization is easily deduced and will be noted below. Indeed all that is required is to restate Butterworth's principle in words as general as his elegant proof.

In a recent defense of the size principle, Kenneth Shepsle explicitly assumes symmetry — "without seriously jeopardizing the argument," he says. He is right insofar as he means to say that an assumption which is necessary to an argument cannot sensibly be said to jeopardize it. But the assumption does jeopardize the applicability of any size principle which is based upon it, since it is an assumption which may not be met in contexts which interest us. Shepsle calls the assumption of symmetry "an anonymity condition," in that "the labels identifying the players in a coalition are not relevant to a determination of a coalition's worth . . . "[9] The notion has a persuasive ring, but it is not the commonplace "anonymity condition" of conventional game theory, which is meant to apply even to games which are not at all symmetric. In its conventional version, anonymity is a condition on *players' abilities*, not on the *structure of payoffs* in the game. Shepsle's condition is strictly a condition on the latter, whereas the conventional condition is a way of saying that we are not interested in the differential skill of the players but only in the logical structure of the game. For example,

[9] Kenneth A. Shepsle, "On the Size of Winning Coalitions," *American Political Science Review*, 68 (June 1974), 505–518, at p. 506.

for a given 2-person game payoff matrix, our analysis of the rationality of various strategies is anonymous in that it does not take into consideration whether the row player is Buster Keaton, Anatol Rapoport, or a sophomore psychology student at a large state university.[10]

Theoretical Issues

In what follows I will first show that Riker's proof is insufficient. Then I will show that for the narrow class of supersymmetric games, Riker's incentive argument yields a valid proof of the size principle. Then I will generalize from the condition of supersymmetry to show that the principle is also valid for a highly restricted class of asymmetric games. Finally, I will comment on Butterworth's critique of the principle and his modification of it, on Shepsle's recent "favorable impression of the size principle's validity,"[11] and on von Neumann and Morgenstern's simple games.

Insufficiency of Riker's Proof. Riker's proof of the size principle is based on a consideration of the possible shapes of the graphs in Figure 1. He suggests that it is necessary to corroborate the principle for three cases, according as

I the slope is always negative,
II the slope is zero or negative,
III the slope is positive in part and negative in part.[12]

Riker concludes that the principle cannot be proved for case III, but that it is definitive for cases I and II. The actual proof for these two cases, however, is strictly algebraic rather than geometric. For case I, if S is a coalition which is winning, then by definition

$$v(S) > v(S+i).$$

Riker claims that *"it is always advantageous, regardless of the division* of [the payoffs to the members of a larger than minimum winning coalition], $(S+i)$, for the s members of S to eject person i."[13]

[10] In this respect, the interest of mathematical game theory is contrary to the interest of what are normally called games, such as basketball or chess. In chess, Boris Spassky will find it profoundly important to know whether it is Bobby Fisher or I who sits across from him. If the game theorists ever solve the game of chess (as tic-tac-toe has been solved), chess will lose its interest except among the ignorant (as tic-tac-toe can be played with interest only by the very young and the daft). Of course, game theorists have long been trying, and they may yet succeed. (Also of course, the class of the ignorant and daft may be much larger in the case of chess than in the case of tic-tac-toe.)

[11] Shepsle, p. 515.

[12] Riker and Ordeshook, *Positive Political Theory*, p. 182.

[13] *Ibid.*, emphasis added.

There are two points to be made about this claim before we turn to the proof of the size principle. First, the claim is not quite accurately worded, and as stated it may well be false.[14] The correct wording is:

> If $v(S_{r-1}) \geq v(S_r)$, then *some* $(r\text{-}1)$-member subcoalition of S_r has incentive to evict the other member. Lemma 1

In subsequent discussion, it will be assumed that Riker's proof is based on the statement in Lemma 1, which is proved in the following paragraph.

> PROOF OF LEMMA 1. Suppose S_r is a larger than minimum winning coalition. If the game is symmetric, then every coalition of r-1 players is also winning. Suppose $v(S_{r-1}) \geq v(S_r)$ by hypothesis. Let A, B, . . . be the players in S_r, and let their payoffs in S_r be p_A, p_B, ... Suppose that the payoff to A is at least as great as the payoff to any other player in S_r. Since $v(S_r) > 0$, it follows that $p_A > 0$. Now consider the coalition S_{r-1} whose members are B. C, . . ., i.e., which is $S_r - A$. Let the payoffs to the players in S_{r-1} be $p_B{}^1$, $p_C{}^1$, . . .
>
> We have,
>
> $$p_B{}^1 + p_C{}^1 + \ldots = v(\text{BCD} \ldots) \geq v(\text{ABCD} \ldots) = p_A + p_B + p_C + \ldots$$
>
> or,
>
> $$p_B{}^1 + p_C{}^1 + \ldots \geq p_A + p_B + p_C + \ldots$$
>
> Hence, $(p_B{}^1 + p_C{}^1 + \ldots) - (p_B + p_C + \ldots) \geq p_A > 0$. That is, the sum of the payoffs to the players B, C, D, . . . in S_{r-1} is greater than the sum of their payoffs in S_r. Hence, it is in their collective interest to evict A in order to form S_{r-1}.

It follows that, in any symmetric game in which S_r is a larger than minimum winning coalition and $v(S_{r-1}) \geq v(S_r)$, some winning subcoalition, S_{r-1}, of S_r has incentive to reduce the size of S_r by evicting the extra player. Note that *not every* winning subcoalition has such an incentive, because a single player, A, whose payoff in S_r is p_A, can profitably be evicted only if

$$p_A > v(S_r) - v(S_{r-1}).$$

[14] Assume by hypothesis that $v(S)-v(S+i) = \Delta$, where $\Delta > 0$. It is possible that the security level, q_i, of player i is less than $-\Delta$. Hence, it is possible that i was making side payments in excess of Δ to the members of S. If S now evicts i, its members collectively lose this excess over Δ. In Game 1 for example, if coalition ABCD has formed with payoffs (26, 26, 26, −28), then ABC cannot afford to evict D, although ABC would be of winning size and $v(\text{ABC}) > v(\text{ABCD})$.

This condition can be put into words which make the point clearer: If, in a larger-than-minimum-winning coalition, *S, the sum of the payoffs to the members of some winning subcoalition is less than the value of the subcoalition, then that subcoalition has incentive to form in the place of S.* The conditional of this statement will always be fulfilled for symmetric games in Riker's Cases I and II, and it can be met even in games which fall into Riker's Case III (the slope of the characteristic function is positive in part).

The second point to be made about Riker's claim (Lemma 1) is that, although he does not say so, Riker evidently assumes that demonstration of the validity of this claim is prima facie *sufficient* to prove the size principle (for Case I games). It should be clear, however, that the validity of Lemma 1 is at best only necessary for proving the size principle. According to Lemma 1, some winning subcoalition of any larger-than-winning coalition has incentive to reduce the size of the coalition. But then it might still happen that any coalition of minimum winning size has incentive to expand its size. In order finally to prove the size principle with his line of argument, Riker would have to show that this latter is not the case. But it may well be the case, as can easily be shown for Game 1.

Because Game 1 is a majority rule game, coalition ABC can by itself determine which of the three represented outcomes will occur. If ABC selects Outcome III, D loses 50 units. Hence, ABC might make D an offer: we will select Outcome II if you will make us a side payment of roughly half the difference in your payoffs at these two outcomes. That difference is 40 units. Suppose ABC lets D have 22 units of that difference and asks for 6 units to each of its three members. The full set of payoffs (with side payments calculated in) would then be (26,26,26,–28,–50). Note that this set of payoffs requires the cooperation in coalition of four players, one more than minimum winning, and all four members of the coalition are better off than they might have been outside the coalition.

Since Game 1 is identically symmetric, it follows that *every minimum winning coalition in the game has incentive to expand* from three players to four. That is to say that the incentive argument which Riker uses to demonstrate that *only minimum winning coalitions* occur can likewise be used in this game to demonstrate that *only larger than minimum winning coalitions* occur. Hence, this proof is insufficient reason to accept the size principle.[15]

The Size Principle in Supersymmetric Games. Riker turned to his incentive argument in order to escape the endless circularities of the von Neumann-Morgenstern solution theory, and still there is circularity. But I have only demonstrated that for at least one game which meets the definition of Riker's Case I, the incentive argument fails because it produces an infinite circular chain of expansions and contractions of coalitions. The question remains whether the demonstration generalizes to all games. The answer is that for one narrowly defined class of games, which can be called supersymmetric, Riker's incentive argument does not lead to circularity, but for apparently all other symmetric games it does. Hence, the size principle can be applied only to supersymmetric games, as will be argued below.

If for some game the incentive argument is not to lead to endless circularity, it must happen that in that game minimum winning coalitions do not have incentive to expand. In general there will always be incentive for a winning coalition to expand *except when the value of that coalition is equal to the negative sum of the security levels of the individual losers.* That is, always except when there is nothing more to be squeezed out of the losers.

If the number of players in a game is n, the number of players in a winning coalition S is $r(<n)$, the payoff to player j is p_j, and the security level of player i is $-q_i$, then the sum of the winnings of the winners is

$$v(S) = \sum_{j\in S} p_j \leq \sum_{i\in S} q_i. \qquad 1)$$

In symmetric games, all players have the same security level, $-q$, so that eqn. 1 reduces to

$$v(S) = \sum_{j\in S} p_j \leq (n-r)q.$$

Hence, if

$$\sum_{j\in S} p_j < (n-r)q,$$

the players in S have incentive to expand their coalition.

Note that there may be an incentive for winning coalitions of some sizes to expand and not for others. For example, there is obviously no in-

[15] Norman Frohlich has presented a related but substantially more elegant and more general demonstration of this conclusion in "The Instability of Minimum Winning Coalitions."

centive for a coalition of $n-1$ players to expand, because its value is q, and the single loser has nothing more to give. For symmetric games, the condition under which *no* winning coalition has an incentive to expand is

$$v(S_r) = (n - r)q, \qquad 2)$$

for all r for which S_r is winning. It is easily shown that this reduces simply to $v(S_m) = (n-m)q$, where m is the minimal winning number.[16]

We can call a game which meets the condition in equation 2 *supersymmetric*. For such games, Riker's incentive argument for the size principle has great appeal: in a supersymmetric game no winning coalition has incentive to expand, but every larger than minimum winning coalition has incentive to contract down to minimal winning size. The condition of supersymmetry is *sufficient* for the size principle to hold. It is also *necessary* to prevent the incentive argument from leading us into endless circles.[17]

A game can be supersymmetric without being identically symmetric, and vice versa. An easily represented class of supersymmetric games, however, is the class of identically symmetric majority rule games whose matrices of outcomes include all permutations on the outcomes $(n-m, n-m, \cdots, -m, -m, \cdots)$, where the payoff $n-m$ accrues to m players, the payoff $-m$ accrues to $n-m$ players, and

$$\frac{n}{2} < m \leq \frac{n}{2} + 1$$

(In order to let the world move on to other concerns in the event of extended lack of agreement, it is sensible also to include in the matrices an outcome in which each player's payoff is 0).

A Supersymmetric Example. To show the appeal of Riker's argument for a case in which the condition of eqn. 2 is met, consider a game which is a modification of Game 1. Let the game be identically symmetric and majority rule, but let the payoffs which are negative in any outcome be equal at –30 (instead of the –10 and –50 as shown). Every non-zero outcome is therefore a permutation on the payoffs (20, 20, 20, –30, –30). Suppose the coalition ABCD has formed with payoffs to its members (20, 20, 20, –30). The value of the coalition is 30. Rather than create a new term, let us follow Butterworth and refer to a member of a winning coalition whose payoff is negative as a *negative gainer.*

Now, according to Riker's argument, three members of ABCD have incentive to expel the fourth member. At first glance, it might seem that ABC should expel D, the negative gainer, but this first glance is deceiving. Since the distribution of payoffs to the coalition is (20, 20, 20, –30), the expulsion of D will gain ABC nothing. ABC has no incentive to expel D. Oddly, however, any subcoalition of D with two positive gainers has incentive to expel the third positive gainer. For example, if B, C, and D collude to expel A, they will gain 50 units to divide among themselves, so that all three can easily be made substantially better off.[18] As the new winning coalition, however, BCD has no incentive to expand by adding A or E.

It is easy to see that, beginning from any initial winning coalition in this game, and given any division of the spoils within that coalition, Riker's incentive argument will lead to a point at which there is no longer any incentive to expand or contract, and that point will always be when a three-person or minimum winning coalition has formed. Of course, it would still and would always be the case that each (or at least n-1) of the individual players has incentive to strive for a larger payoff through coalitional realignment or threat of realignment.

Asymmetric Games. Eqn. 1 suggests another possibility, which is that

$$v(S_r) = \sum_{i \in S_r} q_i \qquad 3)$$

in a game which is *not* symmetric. As an example of an asymmetric game, consider again Game 1 under majority rule with the *only* outcomes being those actually given and not including permutations on these. In this game, players A, B, and C have security levels of 0; D and E have security levels of –50. The value of ABC is 60; the negative sum of the security levels of D and E is 100. Clearly, ABC has incentive to expand.

But any three-player coalition which includes D and E has no incentive to expand. Consider CDE, which has the value of 0. The losers, A and B, have security levels summing to 0. In this game Riker's incentive argument leads any

[16] John von Neumann and Oskar Morgenstern, *Theory of Games and Economic Behavior* (Princeton: Princeton University Press, 1953, 3rd edition), p. 423. Equation 2 implies that S_{n-r}, the losing complement of S_r, is *flat*, that is, every member of S_{n-r} receives his security level. Every subset of a flat set is also flat. For a symmetric game it follows that, if the losing coalition S_{n-m} is flat, then S_p is also flat for every $p \leq n - m$.

[17] In the terminology of the previous footnote, the necessary and sufficient condition for Riker's argument to guarantee that only minimum winning coalitions form in a symmetric game is that all losing coalitions in the game be flat (where losing coalitions do not include blocking coalitions).

initial winning coalition through an inexorable series of expansions and expulsions which ends at a three-player coalition including D and E which has no incentive to do anything further. Hence, the size principle applies to this game. And there is Schellingesque irony in the end result: the two apparently weakest players are sure to be in the winning coalition.

As a rule, it is more difficult to give general analyses of asymmetric than of symmetric games. For symmetric games it was moderately simple to characterize the class of all games to which the size principle evidently applies. For asymmetric games, the task is more tedious. Clearly, a *necessary* condition for the size principle to hold in an asymmetric game is that eqn. 3 be fulfilled for *some coalition of minimal winning size*. A *sufficient* condition is that it be fulfilled for *every coalition of winning size*. The example in the foregoing paragraph, however, shows that this latter sufficient condition is not a necessary condition.

The class of games which meets the condition of eqn. 3, either for all winning coalitions or merely for some minimum winning coalition, is conspicuously narrow compared to the class of all games (it is trivially easy to construct asymmetric games which do not meet the condition, and a random zero-sum matrix generator might work for days before it cranked out a matrix that met it). Perhaps this class is as peculiarly narrow in the space of all majority rule games as the class of supersymmetric games is in the space of all symmetric majority rule games. In any case, it is at least clear that Riker's incentive argument produces endless circularity in an enormous array of asymmetric games, but that it leads to the size principle in a narrowly defined class of asymmetric games.

Butterworth's Modification of the Size Principle. Robert Butterworth has perceived from counterexamples that the size principle is not well founded, and he has suggested a modification which would salvage much of its import. He recommends and proves a principle of the "maximum number of positive gainers," according to which: "In n-person, zero-sum games with a nonpositively-sloped characteristic function, where side-payments are permitted, where players are rational, and where they have perfect information, the largest possible number of *positive gainers* that can occur is the number of players necessary to comprise a minimum winning coalition."[19]

Despite the geometric notion of "a nonpositively-sloped characteristic function," Butterworth demonstrates his principle algebraically rather than geometrically. If we generalize the assumptions involved in his proof, we can restate his principle in a fuller form without implicitly restricting it to symmetric games:

> The number of players necessary to compose a minimum winning coalition sets the upper limit on the number of positive gainers in any n-person zero-sum game where side-payments are permitted, where players are rational and have perfect information, and where, if S is a winning coalition, then for every i not in S,
>
> $$v(S) \geq v(S+i). \qquad (4)$$

The final condition in this statement can be met by some games which are not strictly symmetric, that is, whose characteristic functions are not single-valued functions of coalition size. Games which meet this condition can be called "quasi-symmetric."

In general, to assume that a genuine social interaction is analogous to a symmetric game is to assume that much of social structure is irrelevant to explanations of coalition formation. Unless we live in a state of anarchy, we are likely to play symmetric games only in the laboratory. Hence, it is useful to ask just how asymmetric a game can be while still qualifying as quasi-symmetric and thus coming under Butterworth's principle.

Consider a perfectly symmetric game of n players whose payoff structures are identical. Now let various payoffs be altered marginally while maintaining the zero-sum condition. If some players enjoy marginal gains while others suffer marginal losses, winning coalitions of a given size, say r, will no longer all have identical values. Rather, there will be a marginal spread from the maximum, $v_{max}(R)$, to the minimum, $v_{min}(R)$. Butterworth's logic would now not be violated so long as the minimum value at size r is greater than or equal to the maximum at size $r+1$, i.e.,

$$v_{min}(R) \geq v_{max}(R+i).$$

This condition will determine the amount of variance from symmetry permitted in individual players' payoffs. Other things being equal, one would expect that the larger the number of players in the game, the less the variance which

[18] The 50 units are the difference between the value of coalition BCD (which is 60) and the sum of the payoffs to B, C, and D in coalition ABCD (which is 10).

[19] Butterworth, "A Research Note," p. 744.

would be permitted. For situations in which social structure matters very much, the condition of quasi-symmetry might be met in very small committees but not in large committees. Hence, Butterworth's version of the size principle might apply to coalition formation in such small bodies as the United States Supreme Court,[20] but not to such large bodies as the United States House of Representatives (see further the discussion in the section on empirical issues).

Shepsle's Defense of the Size Principle. Endless circularity such as that implicit in the demonstration of the "Insufficiency of Riker's proof" (above) is the bane of game theory. All too often, if there is a second outcome which is superior to a first, then there is sure to be a third which is superior to the second but inferior to the first. Shepsle's apparent recognition of such paths of reasoning has led him to seek justifications for the size principle other than Riker's argument from incentives. Shepsle adduces an argument for a perfectly symmetric 5-person game (the game is not supersymmetric). But the argument is extraordinarily tenuous and abstruse: it is based on the notion of the "bargaining set" of Aumann and Maschler.[21] Riker's argument from incentives is substantially more compelling, as is perhaps even Representative Gillet's assertion from common sense.

When it comes to generalization beyond the 5-person case, Shepsle notes that "although existence results have been provided for stable sets in an impressive variety of games, the results, to a nongame theorist, appear highly incomplete and idiosyncratic."[22] The results are impressive for their variety only because such variety indicates how ungeneral and ungeneralizable the results are. And this pessimistic realization is likely to impress game theorists far more strongly than nongame theorists. Yet Shepsle concludes that, if "the usual assumptions about n-person zero-sum coalition processes are supplemented with assumptions about coalition intentions and capabilities, there are good reasons to expect minimum winning coalitions in all but the most extreme instances."[23] This claim is not supported by Shepsle's paper or any of his references. The strongest claim which is supported is that there are weak reasons to expect minimum winning coalitions in the instance of perfectly symmetric games with not more than five players. (With fewer than five players the problem is uninteresting: In majority rule games of fewer than five players, the losers cannot number more than one.)

Against Shepsle's claim for our good reasons to generalize from the 5-person case, von Neumann and Morgenstern hint of awe when they discuss the enormous rapidity with which the complexity of the analysis of games grows as the number of players increases.[24] With each additional player there is qualitative change. For three players there is a unique zero-sum game (it is symmetric). For four players, the space of all zero-sum games is 3-dimensional; for five players, 10-dimensional; for nine players, 246-dimensional — it seems absurd to contemplate the nature of such games. To turn to the symmetric games with which Shepsle deals, the 4-person symmetric game is unique. The space of the 5-person symmetric games is one-dimensional; of 9-person games, 3-dimensional; of 101-person symmetric games (the class which the United States Senate might be thought to play when in full attendance), 49-dimensional.[25] Above five persons,

[20] David Rohde argues that the size principle applies to the formation of "opinion coalitions" in the Supreme Court. Hence, although all nine members might agree in upholding or reversing a lower court ruling, the actual opinion of the majority is likely to be written through compromise among only five members (while the other members are left to write their own opinions, if they choose). The raw data Rohde presents do not support the size principle (as can be seen by combining his Tables 2 and 3 and comparing them to the random results of his Table 1). Therefore, he subjectively splits the cases according to whether they involve "threats" to the Court. The threatening cases yield greater than random occurrences of unanimous and overwhelming opinion coalitions and less than random occurrences of minimum coalitions, whereas the non-threatening cases yield greater than random occurrences of minimum "winning" opinion coalitions (as well as, oddly, greater than random occurrences of eight and nine member coalitions). See further Rohde, "A Theory of the Formation of Opinion Coalitions in the U.S. Supreme Court," pp. 176–177.

[21] Shepsle, "On the Size of Winning Coalitions," pp. 508–509. The notion of the bargaining set is developed in Robert Aumann and Michael Maschler, "The Bargaining Set for Cooperative Games," in *Advances in Game Theory*, ed. Melvin Dresher, L. S. Shapley, and A. W. Tucker (Princeton: Princeton University Press, 1964), pp. 443–476.

[25] If the Senate does not confine itself to symmetric games, then it plays in a space of 10^{30} dimensions — a number which would stymie even the appropriations committee. But see Shepsle's footnote 8 and the paragraph to which it is footed; Shepsle, "On the Size of Winning Coalitions," p. 506.

game theory virtually collapses. The results are so few and so trivially narrow that Riker had no hope of deriving a general theory of coalitions within extant game theory (for more than two persons, game theory is largely a theory of coalitions). He therefore intelligently abandoned game-theoretic solution theory and resorted to an ad hoc but intuitively plausible argument from incentives, an argument which is commonplace in economics. The thought of reverting to solution theory at its present state of development cannot be seriously entertained by anyone whose purpose is as ambitious as Riker's effort to generalize about an important, broad class of political phenomena.

Addendum on Simple Games. Supersymmetric games resemble von Neumann and Morgenstern's *simple* games, but they are not equivalent. In supersymmetric games, as in simple games, losing coalitions are flat (see footnote 16) — that is, every player in a losing coalition loses as much as if he were standing alone against a coalition of all remaining players. Simple games differ from supersymmetric games, however, because in simple games every coalition is either winning or losing. It follows that if S is a coalition in a simple game and T is its complement, then either S or T is winning and the other is losing.

Hence, straightforward majority voting games for even numbers of players cannot be simple, although they can be supersymmetric. Similarly, majority games which require over-large majorities (e.g., two-thirds) can be supersymmetric but not simple. Majority games for odd numbers of players are called *direct majority games* by von Neumann and Morgenstern.[26] Such games can be both simple and supersymmetric.

In a phrase of von Neumann and Morgenstern, a losing player is "completely defeated" if his payoff is his security level.[27] We can generalize this descriptive phrase into an instructive definition: a coalition is *completely defeated* if its value is the sum of the security levels of its members, i.e., if it is flat. Obviously, a single player coalition is completely defeated when opposed by a coalition of all other players. In a simple game, every losing coalition is completely defeated. In a supersymmetric game in which a winning coalition has formed, the losing coalition is completely defeated. If we plot the values of winning coalitions by size for a simple or a supersymmetric game, the points will fall on the topmost graph in Figure 1.[28]

The very fact that losing coalitions in a game are completely defeated allows the size principle to be applied to the game. Among symmetric games it applies only to the supersymmetric games, which include the symmetric cases of simple games, i.e., the direct majority games. Since von Neumann and Morgenstern gave more than 80 pages over to simple games,[29] one might expect that Riker would have pursued their discussion in his derivation of the size principle, as in fact he appears to have done. After briefly mentioning simple games, Riker comments that they "are probably rare in nature," and "hence, little of practical value is likely to result from studying them."[30]

Riker's dismissal was perhaps too hasty, because the size principle is of little greater "practical value" than the study of simple games. Indeed, supersymmetric games are little more than an extension of the symmetric simple games to include games with even numbers of players and games in which winning coalitions must be larger than merely simple majority. The validity of the size principle is restricted to just such games (and to their asymmetric counterparts). But there seem to be no clear a priori grounds for declaring that such a restricted size principle is useless — as Riker's remark suggests it is.

Summary. In sum, both Riker's and Butterworth's claims appear to have analytical merit. But the merit of each is highly circumscribed. Under the terms of Riker's proof, his size principle can apply only to the rarefied class of supersymmetric games and their asymmetric counterparts. As Riker has well understood, even when the principle applies, there may be enormous coalitional instability. Butterworth's principle applies to the class of all symmetric zero-sum games as well as to those asymmetric games which meet the condition of equation 4, i.e., to quasi-symmetric games. Again, there may be enormous coalitional instability.

It should be clear that both principles apply to some games (the supersymmetric games). And it can easily be shown that each principle applies to games to which the other does not apply. The size principle applies to those asymmetric games in which the number of positive gainers will necessarily be more than minimal winning size because their security levels are

greater than zero. And Butterworth's principle applies to *all* symmetric games.

Butterworth's principle is somewhat more general. But it is concomitantly perhaps less interesting, since it is not about coalitional size but about the number of positive gainers in a game. Hence it requires a clear notion of what constitutes a positive gain. Ironically, one of the greatest appeals of Riker's initial statement of the size principle was that it specified characteristics of a winning coalition rather than the apportionment of winnings within that coalition. As Anatol Rapoport notes, the results of game theory have been almost exclusively concerned with apportionment; but behavioral scientists are more typically concerned with coalitional structure. In politics, coalitions are conspicuously more tangible than payoffs (there may be exceptions, such as in the politics of graft). In game theory, the reverse is generally true. "In fact, seldom if ever can the behavioral scientist define payoffs in a conflict situation precisely enough to be realistically concerned with the question of their apportionment."[31] By modifying Riker's principle to require explicit measurement of payoffs, Butterworth has reasserted the inutility of game theory for generating predictive theories of political behavior.

It seems unlikely that Butterworth's principle can be applied outside the laboratory. It was a virtue of Riker's principle that it seemed testable in real situations. Alas, Butterworth's principle may be untestable, while the set of games to which Riker's principle can be applied may be too restricted to be of interest, as Riker's dismissal of simple games suggests.

Empirical Issues

Shepsle comments that "it is extremely unfortunate that much of the research on and criticism of the size principle is empirical in nature."[32] On the contrary it would seem that this is the point of a contribution to "positive political theory": to be empirically researched and criticized. If there is misfortune in the empirical work, it is that there is enormous disagreement over the empirical results. In positive theory, factual claims should be either true or false — not both.

A principal reason for disagreement among researchers has been a general failure to propose what constitutes a fair test of the size principle.[33] Those who assert that coalitions in legislatures tend to be of minimal winning size do not give us a base, or null model, for comparison. We need to know what might happen if the theory failed to apply. Since the size principle has the ring of a statistical assertion, it should be possible to find statistical null models against which to compare data from actual games such as legislative coalition formation. For instance, a null model which seems much too easy would be a mean winning coalition size halfway between minimal winning and unanimous size. If the data showed that the mean winning coalition size were merely closer to a bare majority than to unanimity, then the size principle would be supported; otherwise it would be rejected. Perhaps many of us would be surprised if even a Congress composed of all Democrats or all Republicans failed this test. Hence, we would want the size principle to survive a harsher test, such as the random voting behavior model which follows.

A Random Legislature. Assume for a moment that we have a legislature in which the conditions of Riker's principle are met and which is supersymmetric. Every vote by this body determines a winning coalition and a losing coalition. Each player, or legislator, faces the same matrix of outcomes as every other player. Assume also that each player is indifferent about which players join in his coalition — his concern is to be a winner and to gain as much as possible. (This assumption is implied in Riker's statement of his principle.) Under this set of conditions, the size principle is theoretically deducible. The assumption which Riker considers crucial in political analysis is that of individual rationality. It is this assumption which precludes larger than minimal winning coalitions. Let us therefore drop it for the moment and simply look at all winning coalitions which might form, including those which are not minimal winning.

If the legislature is not extremely small, the set of all winning coalitions in it will include many coalitions of minimal winning size, but only one coalition of the whole legislature. A plausible null model under the conditions of Riker's principle is one in which all winning coalitions are equiprobable. If every legislator flipped a coin to decide whether to join the heads or the tails coalition on each vote, the distribution of winning coalitions by size would fit this null model. This distribution is presented in Table 1 for legislatures ranging from

[32] Shepsle, "On the Size of Winning Coalitions," p. 516.

[33] Rohde, "A Theory of the Formation of Opinion Coalitions in the U.S. Supreme Court," is an exception.

Table 1. Percentage of Winning Coalitions by Size of Legislature and Percentage of Members in the Winning Coalitions

Percentage of Members in Winning Coalition / Size of Legislature	50–55%	50–60%	50–65%	50–70%
5	*	62.5%	62.5%	62.5%
9	*	49.2	49.2	82.0
15	39.3%	69.8	69.8	88.2
21	61.7	81.1	92.1	97.3
41	65.1	88.3	97.2	99.6
61	69.4	92.8	99.0	99.9
81 (Senate)	73.4	95.5	99.6	**
101	76.8	97.2	99.9	**
201	87.9	99.7	**	**
301	93.5	**	**	**
401 (House)	95.4	**	**	**

* The smallest winning coalition has more than 55% of the membership.
** More than 99.95%.

5 to 401 members in which a simple majority wins. The United States Senate would correspond roughly to a body of 81 members, and the House of Representatives to a body of 401 members, depending on attendance. In Table 1, the columns present the percentage of all winning coalitions which include more than half but less than 55, 60, 65, and 70 per cent, respectively, of the members. So for instance, in an 81-member legislature, 99.6 per cent of all winning coalitions include less than 65 per cent of the legislators.

From Table 1, it is clear that in large legislatures, the overwhelming majority of all winning coalitions will be near the minimal size just by statistical chance in this simple-majority, random-voting legislative model. Admittedly, this is a crazy model of legislative voting behavior.[34] Traditional discussions of congressional voting are concerned with those structural and attitudinal variables which prevent such random behavior. But the size principle abstracts from such traditional concerns to analyze voting as strictly an individualist effort to maximize utility. To test the size principle is to determine whether such an abstraction is valid in a particular instance, as is done for the House of Representatives below.

House Roll-call Voting. David Koehler has analyzed roll-call voting in the United States House of Representatives and claims to "demonstrate empirically that the members do tend to form minimal winning coalitions."[35] What he actually demonstrates is that the average size of winning coalitions on contested roll-call votes does not correlate very well with the size of the dominant party's majority. In order to determine more directly whether the size prin-

Table 2. Frequency of Occurrence of Majorities by Size

Size of majority %	House of Representatives (83rd–90th Congresses)[a] n	House of Representatives (83rd–90th Congresses)[a] %	Random voting in a 401 member body %
50–55	347	21.8%	95.4%
55–60	264	16.6	4.56
60–65	211	13.3	0.0061
65–70	170	10.7	0.00000016
70–75	145	9.1	—
75–80	121	7.6	—
80–85	120	7.5	—
85–90	83	5.2	—
90–95	132	8.3	—

[a] In "The Legislative Process and the Minimal Winning Coalition," Koehler presents the data graphically; hence, these figures are taken from David H. Koehler, "Coalition Formation and the Legislative Process" (paper presented at the American Political Science Association Annual Meeting, Chicago, 1971), p. 48. The total number of House roll-call votes listed is 1,593. In addition there were 450 votes in which the majority exceeded 95%; these votes have been omitted from the percentages above, which therefore sum to 100 per cent.

[34] I owe this characterization to an anonymous reader of an earlier draft of this paper.

[35] Koehler, "The Legislative Process and the Minimal Winning Coalition," p. 155. For a contrary interpretation of House roll-call voting, see Hinckley, "Coalitions in Congress: Size and Ideological Distance."

ciple fits House voting behavior, we would want to compare the actual frequencies of coalitions of various sizes with their expected frequencies under a plausible null model, such as the random voting model of Table 1.

If the size principle applies very well to the House, then we should expect that the frequency of larger coalitions would be reduced, and the actual vote distribution should be nearer minimal size than the null model distribution. Table 2 presents Koehler's House roll-call data for eight Congresses and the null model distribution for a 401-member legislature. The size principle does not seem to apply. Whereas in actuality only 52 per cent of winning coalitions contained less than 65 per cent of those representatives voting, in a 401-member legislature run by flipping coins, 99.999999 per cent of all winning coalitions would contain less than 65 per cent of the membership. Furthermore, whereas very large coalitions are quite common in the House,[36] they would almost never happen in a random legislature.

Perhaps the random legislature is far too severe a test. The House data, however, do not even do well against the extremely easy test above in which the mean winning coalition size is halfway between simple majority and unanimity. If all the data are included (see the note to Table 2), then the mean winning coalition in several years of House roll-call voting comprised between 72 and 77 per cent of those voting,[37] as compared to the easy null model's 75 per cent.

It appears that legislative voting, at least in the recent House of Representatives, does not sufficiently approximate a symmetric n-person zero-sum bargaining game to permit application of the postulated size principle. It might be that for certain classes of issues, the House would more nearly approximate the conditions of the principle than it does for the general class of all roll-call votes. Unless such a case is found, however, Koehler's data suggest that what we should wish to explain is just the reverse of what the size principle implies, i.e., we should wish to explain why there is such a high degree of agreement on roll-call votes in the United States Congress.

Conclusion. The data in Table 2 imply merely that the conditions for the size principle are not met in the House of Representatives. Suppose there were a legislature in which those conditions were more nearly met. The figures of Table 1 suggest that in a body as large as the House, even if the inordinately stringent conditions for the size principle were actually met, then the principle would be virtually useless on a priori grounds. In a 401-person zero-sum bargaining game with supersymmetry and perfect information, *more than 95 per cent of all possible winning coalitions would be within five per cent of minimal size by chance.* That is, less than five per cent of all possible winning coalitions include more than 55 per cent of the players. Hence, at best the size principle, if it operated, could reduce this five per cent slack.

It follows that, even for the restricted realm to which it is applicable, the size principle could at most produce a marginal improvement in our expectations of coalition behavior in such a large body. And direct statistical test of the principle in a large legislature would probably be inconclusive at best. Since the conditions for the principle are extremely stringent, and since its import decreases as the size of the body to which it is applied increases, it seems unlikely that the principle is either useful or testable in bodies much larger than committees.[38]

This last point is a conclusion similar to that reached above for Butterworth's modification of the size principle. Butterworth's principle might be expected to apply to small bodies such as committees, but not to large bodies. Again, however, Butterworth's principle requires a measure of gains and losses, so that empirical tests of it will be far more complicated than tests of Riker's principle. Indeed, it seems utterly implausible that Butterworth's principle could be tested against House roll-call voting behavior, or even against nine-man Supreme Court behavior. One of the attractions of Riker's principle is that it is simply and directly testable even though the conditions which make for it are beyond easy test. The conceptual difficulties in testing Butterworth's principle, on the contrary, seem as severe as those involved in testing the conditions for it.

Summary

The proof of Riker's size principle is in-

[36] Note that more than 20 per cent of the House votes were nearly unanimous, and these votes are *not included* in Table 2.

[37] Koehler's data are reported in 5 per cent clusters. Hence, the mean cannot be calculated any closer, but a safe guess is probably near 74 per cent.

[38] Riker and Ordeshook, *An Introduction to Positive Political Theory*, p. 177, suggest on the contrary that the advantages of the size principle over other game theoretic solution notions lie "especially in games with very large numbers of players."

The Supreme Court and Critical Elections: A Dissent

TO THE EDITOR:

In "The Supreme Court and Critical Elections" (*APSR*, 69 [Sept., 1975], 795–811) Richard Funston attempts to relate certain decisional patterns in the Supreme Court to national political realignments. Specifically, his primary question is whether "During realignment phases or, as they might be called, critical periods, was the tendency of the Court to declare federal legislation unconstitutional significantly greater than during noncritical periods of stable party competition" (p. 804). This is an interesting and important question since it is frequently asserted that the Court follows election returns. But the author goes on to assert that "To answer that [his] question, all that is necessary is to calculate the arithmetic mean for the total years of critical and noncritical periods" (p. 804). He then proceeds to make such calculations under various control conditions and concludes that " . . . as hypothesized, there has been a significantly greater tendency on the part of the Court during realignment periods to utilize its power to declare federal legislation unconstitutional, i.e., to oppose the law-making majority will, than during periods of political stability, when the Court is part of the dominant political majority" (p. 805). Unfortunately, given the author's procedures, we can have no confidence whatever in the validity of such a proposition for the reasons provided below.

We will bypass in the text the author's errors in data collection and the calculation of arithmetic means.[1] Although bothersome, their correction would not fundamentally alter the nature of the data or, presumably, the arguments Funston makes about them. But we must note other more worrisome problems at some length. Basically, Funston is suggesting a nonspurious correlation between critical/noncritical periods and the frequency of Court decisions nullifying congressional legislation. The distribution of such decisions, however, makes it clear that no such case can be made from the author's data. Of the 18 incidences of counter-majoritarian behavior by the Court during critical periods, 14 occurred during its famed 1933-36 clash with Congress over New Deal legislation. Similarly, 12 of the 14 decisions nullifying a law within four years of enactment occurred in 1933–36. The grossly disproportional contribution of this unique conflict detracts from the vitality of Funston's hypothesis. For in his own words, the hypothesis covers "long periods of time" and refers to "transitional periods" as plural phenomena (p. 796). It is therefore fair to consider how his hypothesis holds up when the New Deal realignment period is separated from the other realignment periods. Table 1 presents computations of Funston's counter-majoritarian coefficient for each of his tables after eliminating in the (a) row the New Deal realignment period and in the (b) row both the New Deal realignment period and the years

[1] Funston misclassifies one case. He lists *Monongahela Navigation Co. v. U.S.*, 148 U.S. 312 (1893), as one which strikes down legislation within four years of enactment. In fact, however, the statute found unconstitutional here was passed in 1888 or five years earlier. He also omits two cases from his list altogether: *Leary v. U.S.*, 395 U.S. 6 (1969), and *O'Callahan v. Parker*, 395 U.S. 258 (1969). Both are cited as declaring acts of Congress unconstitutional in Funston's only source book published after 1969, Philip Kurland, *Politics, The Constitution and the Warren Court* (Chicago: University of Chicago Press, 1970), pp. 24–25, and are also so cited in *The Constitution of the United States: Analysis and Interpretation* (Washington: U.S. Government Printing Office, 1973), p. 1617. None of the laws struck down by these cases had been enacted within the preceding four years.

More serious is the author's miscounting. His realignment or critical periods constitute nine years rather than eight because they are inclusive of both election years. This inclusiveness is clear because the author includes cases from both the beginning and ending years in his computations of cases occurring in critical periods. Yet Funston explicitly says that there are only eight years per critical period (see, e.g., the commentary in his Table 2); moreover, his total number of critical years is 32 or four times eight. Thus the true denominator in his indices should be 36 and not 32 for the critical periods and 132 instead of 136 for the noncritical periods. The changed ratio of critical to noncritical years lowers the coefficients of counter-majoritarianism from 1.20 to 1.05 in his Table 2 and from 3.10 to 2.60 in his Table 3.

In making our calculations for this communication, we have used the same cases as Funston, a list of which he has kindly provided us. However, appropriate corrections have been made for the *Monongahela* case, and the *Leary* and *O'Callahan* cases have been added. In addition, in order to utilize critical periods of eight years as called for by Funston's research design, we have placed the first year of the realignment periods as he reports them (and the cases decided therein) in the noncritical period immediately preceding. Thus, Funston's inclusive nine-year period of 1928–1936 is replaced by the period 1929–1936; 1888–1896 by 1889–1896, and so on.

Table 1. Recomputation of Indices and Coefficients after Elimination of Selected Periods, by Funston's Tables 2–5.*

Author's Table *	Period Elim.	Critical Yrs. Index	Noncritical Yrs. Index	Counter-Majoritarian Coefficient
2	(a) 1929–36	.167	.559	.299
	(b) 1929–69	.167	.505	.331
3	(a) 1929–36	.083	.169	.491
	(b) 1929–69	.083	.204	.407
4	(a) 1929–38	.057	.187	.305
	(b) 1929–69	.057	.228	.250
5	(a) 1929–40	.122	.178	.685
	(b) 1929–69	.122	.218	.560

* The recomputations are based upon corrections discussed in footnote 1.

between the end of that period and 1969 inclusive. The latter years were eliminated because Funston argues that increased population, legislation, etc., produce more opportunities for counter-majoritarian behavior. If Funston is correct here, the elimination of both the New Deal period and subsequent years will control for this.

As the coefficient of counter-majoritarianism in each of the eight calculations presented in Table 1 is a fraction, it is clear that with either the New Deal realignment period alone eliminated or with both that period and subsequent years eliminated, the ratio of nullifications in noncritical periods exceeded that in critical periods. This finding, of course, is the direct opposite of Funston's conclusion and dramatically demonstrates the unique contribution of the New Deal cases to his analysis.

In a footnote Funston indicates his awareness of the New Deal era's disproportionate contribution of cases. He nonetheless defends his analysis by arguing that the burgeoning population, increased congressional legislation, and an expanding Supreme Court docket created more opportunities for the exercise of judicial review; and he concludes that judicial review in "the New Deal era appears to be less unique, though it remains one of great judicial activity" (fn. 67, p. 804). This defense is unconvincing. Indeed, with regard to caseload, it is erroneous in one respect. In the 1933–36 terms the Supreme Court averaged less than 200 opinions per year, while in the 1889–96 realignment period, the Court averaged more than 475 opinions per term. Even in the late 1850s, the Court was deciding nearly 300 cases per term.[2] One might argue, of course, that the Court was refusing to decide more cases in the 1930s than in earlier years, but most such denials do not consume much of the *justices'* time. It is true that Congress was passing more laws in the New Deal period than in earlier realignment periods, and intuitively we might expect a relationship to exist between the number of laws passed and the frequency of judicial review. In the 1889–96 period, Congress passed an average of 202 public laws per year; in the 1929–36 period the average was 334. While this is a 66 per cent increase, it pales in comparison to the 500 per cent increase in the number of times the Supreme Court struck down legislation passed within the previous four years. Finally, we can see no particular reason to believe that population is very closely related to the incidence of judicial review. Even so, there is again a considerable difference between the five-fold increase in the latter and the 95 per cent population increase between 1890 and 1930.

Even if one feels that it is not fair to exclude the New Deal realignment period from the calculations or, alternatively and despite our analysis just concluded, still feels the New Deal cases are not unique, it is possible to demonstrate that Funston's conclusion regarding tendencies in the Court is invalid. We have computed the index for each of the five non-critical and four critical periods for Funston's Tables 2–5. (The index is the average number of nullifications per year; averaging is necessary to control for the length of the periods surveyed.) We scored the noncritical periods as 1 and the critical periods as 2 and computed a product

[2] See Felix Frankfurter and James Landis, *The Business of the Supreme Court* (New York: Macmillan, 1927), pp. 60 and 297, for data on the Court's cases in the periods cited. Opinion frequency from the New Deal era came directly from the *U.S. Reports.*

moment correlation coefficient. If Funston's hypothesis is correct, the index should rise in the critical periods and fall in the noncritical periods. A perfect matching of the rising and falling of the index and the critical/noncritical scoring would produce a correlation coefficient nearing 1.00; thus to the extent that the coefficients attain or approach this figure, Funston's hypothesis would be supported.

The results, however, are as damaging to Funston's claims as are those presented in Table 1. While the correlations are in the direction needed to support his hypothesis, they are insignificant — ranging from .054 to .312.

Given the distribution of the data, these findings are hardly surprising. After all, in Funston's Tables 3, 4, and 5 there are no nullifications in the first four periods and in Table 2 there are none in two of the first four periods. And in all tables, the index for the critical periods beginning in 1889 is less than that for the subsequent noncritical period. The long and short of it is that there is simply no systematic rise and fall of Supreme Court countermajoritarian behavior in conjunction with critical elections.

It may be speculated that a more logical approach than that used by Funston will bear out the hypothesis that the Supreme Court's tendency to counter-majoritarianism increases during the so-called critical periods surrounding party realignment. Funston's research design identifies the SRC's eight year realignment phases as the critical years when counter-majoritarianism is expected to be at its greatest. But three of these four phases were *fully complete before* the new law-making coalition acceded to power, i.e., captured control of the Presidency and Congress. And in the fourth period (1929–36), four years went by before power shifted. It seems only logical, however, that the motivation and opportunity for the Supreme Court to strike down acts of Congress will occur after the new coalition is in a position to adopt legislation. It is anomalous to expect this beforehand. Yet seven-eighths of Funston's so-called critical years come beforehand. We think it makes more sense to use as the critical years the lag periods — *and the lag periods only*.[3] We define the lag period as that

[3] In his Tables 4 and 5, Funston introduces and uses the concept of the lag period, but he combines the lag periods with the realignment period rather than making calculations for them separately. He describes two variations of the lag periods, neither of which coincide with our definition of it.

Table 2. Breakdown of Laws Declared Unconstitutional During Lag Periods

Lag Period	Years	All Cases Declaring Acts of Congress Unconstitutional	Cases Declaring Acts Unconstitutional Within 4 years of Enactment
1829–36	8	0	0
1861–65	5	1	1
1897–1909	13	11	4
1933–40	8	13	12

	(b) 1933–69	.192	.181	1.060

period between the time the new coalition assumes control of the elective branches of government and the time its President appoints a sufficient number of justices to control the Supreme Court's decisions.

We have calculated the lag periods following the realigning elections. They are 1829–36, 1861–65, 1897–1909, and 1933–40. In Table 2 we show the incidences of counter-majoritarianism over the lag periods. The skewed contribution of the New Deal cases declines considerably for all cases declaring acts of Congress unconstitutional but it is still predominant (nearly 70 per cent) for the four year cases. The overall coefficients of counter-majoritarianism increase somewhat but not dramatically. In Table 3 we parallel Table 1 by eliminating the New Deal lag period and then the entire 1933–69 period. Here three of the four coefficients are not fractions. They are so minutely above the fractional level, however, as to offer no support for Funston's hypothesis. Finally, in the manner described earlier, we compute product moment correlations. For both all cases finding acts of Congress unconstitutional and the four-year cases, the result is positive but insignificant. (.129 and .375 respectively).

In sum, we obtain better results (in terms of supporting the hypothesis) by using only the lag periods rather than the realignment periods or a combination of the two. Nonetheless, this approach still does not enable us to confirm the hypothesis. Taken together, the best interpretation that can be put on the data is that, overall, there is no significant difference between the Court's counter-majoritarian behavior in the lag periods and that in noncritical years.

We can approach Funston's hypothesis from yet another angle — namely that of focusing on counter-majoritarianism during the noncritical years. If, as Funston argues, "the Supreme Court reflects the will of the dominant political forces" (p. 796) during these years, it would follow that the Court would not best serve the incumbent coalition by declaring its newly passed laws unconstitutional. Rather, to the extent that the Court engaged in judicial review, it would aid the incumbent coalition by striking down the laws adopted by the previous coalition. We would especially expect this in the first decade or so after the new majority had obtained control of the Court through the appointment process. The data dramatically belie this presumption, however. Sixteen of the 17 laws found unconstitutional during the ten-year periods were passed by the incumbent coalition. And the one exception was not passed by the previous coalition but by two coalitions preceding.

Finally, as everyone knows, the Court must sit and wait for prospective nullifying cases to be brought to it. The rate at which they are brought cannot be expected to be constant across periods. Nor can we assert that the rate will vary with length of period or with number of cases docketed in each period. Yet — whatever that rate — its variation is crucial to any inference regarding the inclination of the Court in the periods analyzed. Imagine, for example, that in a critical eight-year period the Court nullified legislation in 24 of 100 opportunities while in a noncritical eight-year span 16 of 32 statutes were voided. Funston would report the ratio of 24 to 16 as supportive of his "tendency" inference. But, clearly, the Court would be striking 24 per cent of the challenged statutes in the critical era as against 50 per cent of those questioned in the noncritical period. It follows inevitably that no inference about "tendency" of the Court to nullify federal law can be drawn absent appropriate attention to the opportunities for nullification.

As a consequence of the problems we have outlined, an overall conclusion about the Funston paper has two dimensions. First, if there were no other shortcomings, the null hypothesis — that there is no difference between the tendency of the Court to nullify congressional legislation in critical and noncritical historical periods — cannot be rejected given the distribution of the cases used by Funston. But of greater importance, the null hypothesis could not have been rejected — whatever the distribution of the cases — because of a basic defect in Funston's research design, as outlined above.

Having said all this, can we dismiss the notion that the Supreme Court has a greater tendency to overrule the Congress in certain historical periods than in others? Our analysis does not suggest that this inquiry should now be dismissed. It will remain an interesting but open question until evaluated by appropriate design and testing procedures mainly lacking in "The Supreme Court and Critical Elections."

S. SIDNEY ULMER
University of Kentucky

Funston Reply to Canon and Ulmer

TO THE EDITOR:

I very much applaud the refinements which Professors Canon and Ulmer have brought to

the continuing study of the relationship between judicial policy making and change within the larger American polity. In "The Supreme Court and Critical Elections," I noted (p. 807) that "much more work can and should be done in this area," including the use of "different and more sophisticated statistical techniques . . . to analyze the data presented here." Canon and Ulmer have done exactly that, and I can hardly complain if my own prescription generates conclusions different from those which I presented.

The essence of their criticism, however, has already been stated, more tersely and more elegantly, in Professor Paul Beck's letter commenting upon my article which appeared in this September's issue of the *Review*. Rather than reiterate at length fundamentally the same points already made in my response to Beck, I will simply refer the interested reader to that earlier exchange. Simply put, I believe Professors Canon and Ulmer have largely misconstrued the purpose and thrust of "The Supreme Court and Critical Elections." As I wrote in my response to Professor Beck, the article "was intended — and, I think, can and should so be read — as a synthetic rather than an original analytic effort. It was an attempt, as I stated in several places, to both integrate and test the assertions of certain leaders in our profession — most notably Dahl, but also Burnham — *on their own terms*."[1] Canon and Ulmer (note 3) credit me with introducing the concept of a "lag period" and criticize the logic of my use of that concept. Quite apart from the fact that I acknowledged this (pp. 807–08) and commented at length upon it, I did not introduce the concept. Professor Dahl did, and my use of the concept was the result of my understanding of his discussion of it, as I suggested in my footnote 72. Because I was seeking comparability with Dahl, I was not free to redefine his concept, though I would agree that Canon's and Ulmer's lag periods are more logical. Similarly, I am taken to task (note 1) for my use of *Monongahela Navigation Company* v. *United States*, 148 U.S. 312 (1893). But, again, comparability dictated its use, as a reading of Dahl's footnote 11 will show.[2]

My omissions of *Leary* v. *United States*, 395 U.S. 6 (1969), and *O'Callahan* v. *Parker*, 395 U.S. 258 (1969), were not an oversight. As I commented in the appendix, different people count the cases differently,[3] and within the bounds of reason Canon and Ulmer are free to count them as they wish. But the way I read these cases they are not examples of what I was talking about in "The Supreme Court and Critical Elections." I was concerned with cases declaring congressional statutes to be unconstitutional in whole or in part and not merely as applied. The criminal statutory presumption involved in *Leary* was held to be irrational and hence unconstitutional *unless* it could be said with substantial assurance that the presumed fact was more likely than not to flow from the proved fact on which it depended.[4] To me this suggests that a change in the American drug scene would reinvigorate section 176a of the Narcotic Import and Export Act. Regarding *O'Callahan*, it need only be noted that the majority never specifically invalidated the three articles of the Uniform Code of Military Justice under which O'Callahan was charged; it merely held that they could not be applied to this fact situation. As the dissenters point out, it was tradition rather than explicit provisions of the statute that were voided on this occasion.[5] That my reading of *O'Callahan* is at least plausible is, I think, supported by the result in *Relford* v. *Commandant*, 401 U.S. 355 (1971), sustaining a successful prosecution under the very

[1] I accepted Dahl's and Burnham's evidence and assumptions for purposes of replication. But the work of both has recently been subjected to serious criticism. Jonathan D. Casper, "The Supreme Court and National Policy Making," *American Political Science Review*, 70 (March, 1976), 50–63; Dorothy Buckton James, Book Review, *Political Science Quarterly*, 91 (Spring, 1976), 147–148. It is far too facile, however, for me simply to observe that Professors Canon's and Ulmer's quarrel lies with others than myself. I shall, therefore, attempt to respond to the more important of their specific objections.

[3] C. Herman Pritchett, *The American Constitution*, 2nd edition (New York: McGraw-Hill, 1968), p. 166, and *The Constitution of the United States of America*, Sen. Doc. no. 39, 88th Cong., 1st sess. (Washington, D.C.: U.S. Gov't Printing Office, 1964), pp. 1387–1402, report that sixty-five laws were voided by 1937. On the other hand, Professor Abraham identifies seventy-six; Henry Abraham, *The Judicial Process*, 3rd edition (New York: Oxford, 1975), pp. 288–291. Even for more recent decisions there is no agreement; thus, Professor Casper states that for the period 1958–74 there have been 28 instances of the exercise of the power of judicial review, while Professor Dionisopoulos counts thirty-two. Casper, "The Supreme Court and National Policy Making," pp. 53–54; Allan Dionisopoulos, "Judicial Control of Congress," (paper, Department of Political Science, Northern Illinois University, 1976).

[4] 395 U.S. at 36.

[5] 395 U.S. at 274 (Harlan, J., dissenting).

same provisions of the U.C.M.J. involved in *O'Callahan*.[6] Nevertheless, as I have said, Canon's and Ulmer's inclusion of these decisions is arguable. But, if they wish to count *Leary*, they should be consistent and include its companion case, *United States* v. *Covington*, 395 U.S. 57 (1969), as well.

As for Canon's and Ulmer's discussion of the Court's caseload, I must confess that I am puzzled about its relevance to "The Supreme Court and Critical Elections." That the Court averaged less than 200 opinions per year in the 1933–36 terms, while averaging more than 475 opinions per term during 1888–96, may or may not say anything about opportunities for the exercise of the power of judicial review. What was the percentage of *federal* legislation involved in these cases during these terms? Moreover, the consequences for judicial review of the change in congressional legislation from 1889 to 1936 cannot be fully explained simply by focusing upon the number of public laws enacted per year. Surely one must recognize a qualitative transformation in the scope, subject matter, and potential social impact of federal legislation during this period. Finally, my point concerning population increases was, I thought, simple enough. I didn't suggest that such increases were "very closely related to the incidence of judicial review." Rather, the point was that an increase in population, particularly when coupled with an expansion of the number and scope of federal laws, would increase the probability that the application of any one law to a particular individual or group would create a situation giving rise to a constitutional challenge and, thus, would increase the *opportunities* for the Court to exercise its power of judicial review.

At best, Canon and Ulmer have suggested that the conclusions based upon my analysis were potentially a product of the asymmetry in the coding rules as well as of the nature of the evidence itself,[7] a possibility which I did not attempt to conceal (p. 804, n. 67). The fundamental argument, however, is by no means disproven. It is true that Canon and Ulmer rather freely use words such as "invalid." But, upon careful reading, their criticisms seem excessively stated, going beyond that which their own analysis will support. For example, some of their findings "are in the direction needed to support the [Dahl-Dooley] hypothesis," though given their techniques these do not rise to the level of statistical significance. And, using their own definition of lag periods, they obtain "better results" than I I do not, therefore, understand Canon and Ulmer to argue that the Court is more likely to act in a counter-majoritarian manner during noncritical periods than during critical periods of partisan realignment, although at one point they do appear to do just that. Rather, their essential conclusion is much more modest: The evidence is inconclusive. Instances of judicial review, however, are but one body of data which may be used to examine the hypothesis that conflict between the judiciary and the popular branches does not occur randomly but is correlated with periods of electoral realignment, and a significant amount of research exists to sustain that hypothesis. Professor David Adamany's extensive historical survey of Supreme Court decision making during critical periods, though it reaches normative conclusions about the Court's function in American government much different from my own, offers support for the thesis advanced in "The Supreme Court and Critical Elections."[8] Sheldon Goldman and Thomas Jahnige have reported a distinct coincidence between Stuart S. Nagel's "Court-curbing" periods and realigning election cycles,[9] a finding corroborated by others.[10] And Adamany has adduced evidence, though slight, that Justices are more reluctant to resign after a realigning election.[11] In short, I may not have operationalized the variables well (though, I reiterate, that operationalization was dictated by concern for comparability), but Canon and Ulmer have not directly addressed — let alone invalidated — the fundamental thesis concerning periodicity in Supreme Court behavior which was advanced in "The Supreme Court and Critical Elections."

Finally, I emphasize again that mine was a preliminary study designed to stimulate further inquiry. Whether future research should pro-

[6] Neither did Casper, "The Supreme Court and National Policy Making," include *O'Callahan* as an example of the exercise of the power of judicial review.

ceed along Canon's and Ulmer's statistical trail or Adamany's historical path I leave to the interests and skills of future researchers. However, in "The Supreme Court and Critical Elections," I noted (p. 807) "that this study represents but a very tentative first step. Not only does it suggest ways in which concepts and research from other areas of the discipline . . . can be utilized to address one of the classic problems of public law, it also illustrates the methodological and conceptual problems involved in such borrowing." While Professors Canon and Ulmer take issue with other points of my analysis and interpretation, it seems to me that their criticisms buttress me on this one.

RICHARD FUNSTON
San Diego State University

Evaluation of a Presidential Election Game

TO THE EDITOR:

Guillermo Owen's recent discussion of the disparities in power under the electoral college system for presidential elections (*American Political Science Review*, September 1975) ignores several important factors. The use of the Shapley value concept from game theory to evaluate the presidential election game is helpful in the exploration of the constitutional biases in the electoral college system. It is important to note, however, that the assumptions underlying the value are somewhat too restrictive for the electoral college game. Moreover, some of the simplifying assumptions made by Owen to facilitate his analysis appear to be of somewhat dubious empirical validity.

Though my criticism is specifically aimed at the paper by Owen, it also applies to other attempts to use an a priori constitutional index as a descriptive theory of electoral power. My remarks point to some of the limitations inherent in the use of the Shapley value for the analysis of voting games. The analysis of voting situations by the Shapley value from game theory certainly uses a theoretically interesting approach, though its utility as an empirical explanation of electoral power is somewhat questionable.

Owen shows, using appropriate simplifying assumptions, that disparities in power in the electoral college system stem from (a) the requirements that the number of electors for a state both be integer ("integrity factor") and include two electors to correspond to the state's Senate representation ("Senate factor"); (b) the usual practice of casting all of a state's electoral votes for the winner of the state, thereby increasing slightly the power of the largest states ("unit rule factor"); and (c) the greater influence a voter usually enjoys in the largest states because his ability to influence his state's vote tends to drop more slowly than the number of electoral votes the state casts ("decomposition factor"). Such factors have been discussed by others, including John Banzhaf.[1]

An analysis based on Shapley values ignores several other differences — not acknowledged by Owen — in the power of voters under the electoral college system. If some states had the same number of voters and electoral votes, for instance, then voters in these jurisdictions would have the same power under the Shapley value's assumptions. The disparities discussed by Owen do not occur when some jurisdictions are the same size. The actual power of voters in different states of the same size can vary, however.

Differences in actual power result because not all coalitions of states (or voters within a state) are equally likely to be formed. Equiprobable coalitions are required by the Shapley value as the value ignores "affinities" between players. A candidate's performance in a state, however, is frequently positively or negatively correlated with his performance in another particular state; indeed, the decision by individual voters within a state may be correlated. Thus the coalitions are not equiprobable. A candidate's performance in an individual state in the farm belt, for example, may be more indicative of his success in other states in the group than in the country as a whole. This results because voters in some subsets of states tend to have common interests and outlooks.

Voters in different states have different probabilities of influencing the selection of their state's electoral college slate. The Shapley value ignores this except through the "decomposition factor" in which the probability of a voter's influencing a state declines with state size, but less rapidly than state size (thus the total influence of a voter tends to rise with state size). The probability distribution of the median voter in a state will become more concentrated as state size increases as a consequence of the decomposition factor.[2] The decomposition fac-

[1] See John Banzhaf, "One Man, 3.312 Votes: A Mathematical Analysis of the Electoral College," *Villanova Law Review*, 13 (Winter, 1968), 304–332.

[2] See p. 85 of Lloyd S. Shapley, "Political Science: Voting and Bargaining Games," pp. 37–92 in *Notes of Lectures on Mathematics in the Behavioral Sciences: Lectures Given at the 1973 MAA Summer Seminar at*

tor does not capture all the reasons why the probability that a voter influences his state's result differs among states. Different probabilities, for example, might apply to voters in different states of equal size, even though the decomposition factor does not apply. Voters in close states are much more powerful than those elsewhere. States that are solidly in the camp of one party are less important than swing states in determining the winner of close elections. The swing state is more powerful because it is decisive in a larger proportion of the coalitions that actually form. This is illustrated by three-person arbitration panels in which neither the labor nor management representative matters. It is unlikely that those states on one side of the spectrum will ally themselves with those on the other side (except in a landslide). Coalitions which include swing states are most likely to form winning coalitions. This is another way in which the assumption of the Shapley value that all coalitions of states are equiprobable is violated. The individual voter is more crucial in a close state. The system also always disenfranchises those who do not support their state's winner because in no circumstances would it have mattered if such individuals did not vote. Banzhaf,[3] for example, does concede that the power measured by Shapley values does not equal the actual ability to affect the outcome of an election, but reflects the theoretical biases in the electoral college arrangement. Though Banzhaf believes that theoretical inequalities are the only type of bias on which we can focus in determining the fairness of a system, I argue that the system itself produces these other sorts of inequalities. This occurs because some states are biased or not independent of one another in presidential elections.

The Shapley value provides a measure of some of the constitutional biases inherent in the electoral college system. But because of assumptions underlying the value, the use of it implies by definition the neglect of certain disparities of power. The specific features of the real situation that ought to be captured in the power index obviously depend on how the numbers will be used. The symmetry imposed by the Shapley value might be useful in some situations, but it should not be utilized in all applications. The recognition that some coalitions form more easily than others led Owen to offer elsewhere[4] another concept to supplement the Shapley value. Owen's idea drops the assumption that all coalitions are equiprobable by permitting the players to have "affinities" with other players, thereby relaxing the symmetry inherent in the value.

In addition to my observations on the implicit assumptions made in using the Shapley value I also wish to comment on the plausibility of two of Owen's explicit assumptions. Although they facilitate the analysis, they are somewhat questionable. I think it is appropriate for Owen to use the assumptions in an abstract model. My point is that Owen overstates the plausibility of the assumptions, not that they should not be used. Owen assumes that all of the electoral votes in a state are cast for the candidate who carries the state and that the election is decided in the electoral college without reaching the House of Representatives. In order to justify the latter assertion he notes the infrequency of referral to the House (1800 and 1824 only) and maintains that George Wallace in 1968 expressed interest in making a deal in the electoral college rather than letting the House decide. It is certainly not clear that correctly characterized Wallace's 1968 objective. Even if such a deal occurred, it would then have violated the prior assumption that the electoral votes of a state are cast for the candidate who carries the state. Thus, an example cited by Owen in support of his assumptions must violate either that one or another. In the recent past the 1960 election also exemplifies a contest that that could have easily reached the House, even without a national third party.

Owen justifies his assumption that all the electoral votes in a state are cast for the candidate who carries the state by expressing doubt that the wandering electors of recent decades would have behaved in that manner in truly close elections. I would argue the reverse, however. Both the power and incentives of individual electors and groups of them to defect rise as the split of electoral votes gets closer. The close election, though, is the most relevant case for the computation of marginal power. This argument, in fact, suggests the desirability of abolishing the electors, even if the electoral college system is retained.

I think that the approach of Shapley values in the examination of the electoral college is useful. I also think, however, that one must

explicitly recognize the limitations imposed by its assumptions. The Shapley value develops only some of the sources of bias created by the constitutional framework of the electoral college system. Other kinds of bias caused by the electoral college must also be considered in the constitutional debate.

CHESTER SPATT
University of Pennsylvania

TO THE EDITOR:

Mr. Spatt's Comment brings up some points which I would like to answer. My hope is not to deny their validity or importance, but rather, to explain why such problems must arise. In general, his points fall into two categories: in the first place, there is the question of whether the Shapley value can actually measure the power of players in such a game; secondly, there is a question as to whether — in view of my simplifying assumptions — my calculations actually give a good approximation to the "true" Shapley value. I shall attempt to deal with these in turn.

1. The Shapley value, as originally developed (in an axiomatic manner), assigns an expected payoff to each n-person game — with the understanding that the game is entirely defined by its characteristic function. Thus it can take into account nothing which does not appear (at least implicitly) in the characteristic function; in particular it does not take into account personal affinities among the players, nor — as is here the case — the strong existing tendencies for the electorates of certain states (e.g., Alabama and Mississippi) to vote similarly.

Under the circumstances, I am the first to admit that the Shapley value does not properly evaluate the several voters' "ability to influence election outcomes." Two questions naturally arise: (a) Why, then, should we bother to study the Shapley value for such games? (b) How should the value concept be modified to take such affinities and voting patterns into account?

To answer (a), I feel that, from a theoretical (constitutional) point of view, the inequities reflected in the Shapley or Banzhaf values are more serious than those which are due to voting patterns, i.e., that constitution-writers should avoid the Shapley-value-measured inequities more seriously than they should avoid the others.

To make this point clear, let us consider the case of a Southern state, such as Alabama or Mississippi, in which the overwhelming majority (say 70 to 80 per cent) of the population belongs to the Democratic party. In that case, the remaining 20 or 30 per cent, who style themselves Republicans, are effectively disenfranchised: they cannot influence, say, the outcome of the gubernatorial or presidential elections, nor have they any hope of being elected to such office. To avoid this problem, there is perhaps something to be said for "breaking up" the Democratic party (as some Republicans would doubtless like); there is even something to be said for declaring Alabama (legally) a one-party state, outlawing the Republicans and all other parties, in much the same manner as Iran has recently been declared (by the Shah) a one-party state. One or the other of these measures might conceivably work; I would not however endorse them. I do feel, on the other hand, that the inbuilt inequities of the system (i.e., those measured by the Shapley value) should be corrected unless there is strong reason to maintain them.

To answer (b), I believe that the voting affinities among states should first of all be measured by some statistical technique such as, e.g., a factor analysis of election results. (I have in fact some unpublished results in this direction.) Once these affinities have been measured, some modification of the Shapley value concept should be used; footnotes 2 and 4 to Mr. Spatt's letters refer to two such modifications. (There may be others in the literature, but I am unaware of any.) We would then probably find that it is such "swing" states as New York and Ohio that influence elections most strongly. In any case, this is certainly something that should be done, if only to help presidential candidates plan their strategy.

2. It is clear that, in each of my simplifying assumptions, I was doing what all model-builders must do: willy-nilly one sacrifices accuracy for the sake of tractability. The trouble with a perfectly accurate model is that it would be as complex as the original system; thus the question is not whether my model was totally accurate, but rather whether the inaccuracies introduced were (a) small enough to make my results valuable as they stand, and (b) justified by the consequent economy of time and effort.

With regard to (a), I must admit that it is difficult to estimate the error introduced by my simplifications. I feel quite certain, however, that the errors are negligible when compared to the inequities measured; i.e., these inequities do exist and are almost exactly as given in my paper. I feel this is so because a deadlock in the electoral college is simply of such a low probability as to make very little change in my

calculations; similarly the probability that an election be changed by electors reneging on their pledges is too small to make much change in my figures. (I agree however with Mr. Spatt that it would be advisable to abolish the individual electors if not the electoral college; the fact that such an event has negligible probability does not mean that it should not be prevented.)

With regard to (b), I believe that there is simply no question; an attempt to dispense with my simplifications would have increased the necessary effort and computer time to astronomical levels, for what I consider a minimal increase in accuracy.

In brief, I thank Mr. Spatt for his comments, and agree with much of what he says. I wish moreover that someone would continue this work along the lines mentioned above. I feel nonetheless that my analysis is valuable both for practical and theoretic reasons, and believe that my paper gives accurate results.

GUILLERMO OWEN
Rice University

A Reanalysis of Achen's Critique of the Converse Model of Mass Political Belief

TO THE EDITOR:

I never expected to find myself defending Philip Converse's conception of the instability of political attitudes, but Christopher Achen's reinterpretation in the December, 1975 issue of the *Review* seems so strikingly mistaken that there is no alternative. These authors and others have struggled to explain the low correlations over time associated with administration of the same attitude questions to the 1956–58–60 SRC panel, and the following factors have been variously advanced:

A. "Real change." What everyone seems to have in mind here is measurable change in some definite metrical variable associated with the respondent—the sort of change we might measure in body weight, blood pressure, etc.
B. "Measurement error." A disturbance (generally assumed to be stochastic) imposed on the measurement process by imperfections in the measuring instrument: slop in the manometer gear train, keypunching errors, and what Achen refers to as "vagueness" in the questionnaire items.
C. "Randomness internal to the respondent, and his fault." This is the source advanced by Converse, and it has no clear parallel in (classical) physical measurement: the respondent, although lacking a real opinion or possessing only a very vague one, just blurts something out "at random," avoiding the embarrassment of admitting to no opinion.

After Achen develops a stochastic model used to estimate item unreliability (factor B), he exhibits corrected correlation coefficients associated with readministration of the items. For six of the eight political attitude items administered in 1958 and 1960, the corrected correlations range from 0.96 to 0.99; the housing and electricity item discussed by Converse yields a striking 0.98, compared to an uncorrected correlation of only 0.37 (the other uncorrected coefficients range from 0.44 to 0.57). It is evident that almost all of the very considerable change in responses between 1958 and 1960 must be attributed to measurement error; indeed, when one takes into account several approximations and imperfections in the process (sampling error, the use of the Pearson correlation coefficient in the absence of continuously distributed data, the probable correlation of Achen's disturbance terms u_1 and u_2, etc.), Achen finds no positive evidence whatever of changes due to factors A or C in responses to the housing and electric power item. Unfortunately, Achen's model begs the question: it is not only incapable of distinguishing between factors B and C — it attributes any C-type variance that may be present to factor B.

Before we begin to examine the model it is worth noting that although Achen refers to the critique of Pierce and Rose (in the June, 1974 *Review*) as "idiosyncratic" and to the reply of Converse as "powerful," Achen's approach is rather closer to that of Pierce and Rose than to that of Converse. The latter's "black-and-white" model assumes heterogeneity in the population: different dudes are subject to different stochastic processes — specifically, there is a group whose responses are quite stable over time, and a group whose answers obey some probability distribution. Both critical papers, however, assume homogeneity in the population: each respondent is subject to the same process.[1] Achen's model is as follows, where x is the respondent's "observed opinion" (his re-

[1] These comments refer principally to the first part of Achen's paper, to p. 1226; most of them apply as well to his multiple regression analysis, pp. 1227ff., but the latter does assume heterogeneity. This is purchased at the considerable price of assuming each random variable is realized only once (all sample sizes are one), introducing—obviously—a really desperate problem of sampling variation and estimation. It seems to me almost incredible that anyone would use estimates derived under such assumptions as the dependent variable in a multiple regression, but the whole issue is mooted by the fundamental problems in Achen's model that are discussed below. The sampling problem itself is considered in some detail in the Hunter and Coggin letter.

sponse), p is his "actual opinion," e is "measurement error," and $u_t = p_{t+1} - p_t$, with subscripts indicating observations at successive points in time. (Achen appears to regard factors A and C to be somehow combined in the u's — or alternatively the p's — with the e-terms isolating the effects of factor B, measurement error.)

$$x_1 = p_1 + e_1$$
$$x_2 = p_2 + e_2 = p_1 + u_1 + e_2$$
$$x_3 = p_3 + e_3 = p_1 + u_1 + u_2 + e_3$$

All these quantities are to be interpreted as random variables, and by "suitable" assumptions Achen estimates the variance of the e's, establishing that (in the case of the housing and electricity item) the e's greatly dominate the u's.

Stochastic models like this one are subtly pernicious, permitting definite algebraic manipulations and numerical conclusions while at the same time rendering the mind almost totally incapable of straight thought. And they appear so powerful: Achen's model, indeed, permits us to assess the relative influence of the u's and the e's, although neither p's nor u's nor e's is observed for any respondent. The reader should not blandly admire such an achievement, but should ask himself *if it is possible,* ignoring, for a moment, the details of the model itself. In this case, we have quantitatively distinguished the relative influence of question vagueness and what we might call respondent vagueness, although question vagueness is not some simple thing like a bloodstain on an interview schedule, but is only realized in the mind of the respondent, alongside the respondent's own vagueness, if any. Certainly every professor should realize that the distinction between vagueness in an (exam) question and vagueness attributable to the respondent is something about which we may form judgments and talk at length, but surely such a distinction will not yield fully and unequivocally to a nearly trivial application of the algebra of expectations. I convince no one by saying this: you are all intimidated by algebra.

So let us confront the algebra. Note that disturbances of type B and type C manifest themselves rather similarly to the outside observer, and that what Achen calls the "actual opinion," p, already includes whatever Converse disturbance may be present. It would be natural to represent this as follows, where w is the Converse disturbance and q is the real-underlying-honest-to-God-no-kidding opinion:

$$x_1 = q_1 + w_1 + e_1$$
$$x_2 = q_2 + w_2 + e_2$$
$$x_3 = q_3 + w_3 + e_3$$

In this case the w's and e's enter the equations symmetrically, and it is obvious that the separate variances cannot be estimated from the data. (Ah, but do we wish to assume there *is* such a thing as a q? One is uneasy with either answer, but for many respondents, much of the time, opinions are assuredly not merely white noise, and any model that assumes homogeneity of the population has little alternative but to include something like q. The letters column is obviously no place to resolve core issues in the philosophy of attitude measurement, or even to consider in detail the relationship between Achen's model and the far more elaborate Coombsian model — for categoric responses — which Achen briefly discusses. The technical deficiencies of Achen's model are quite independent of such considerations.)

Formally, Achen avoids the natural symmetry of the B-type and C-type disturbances by forcing them to enter his model unsymmetrically:

$$x_1 = p_1 + e_1$$
$$x_2 = p_1 + u_1 + e_2$$
$$x_3 = p_1 + u_1 + u_2 + e_3$$

Opinion *changes,* the u's, are said by Achen to include the Converse disturbances, and large estimated variances for the u's are said to indicate large Converse disturbances; small u's and large e's, on the other hand, indicate that measurement errors are dominant:

> In summary, when a voter is stable in his views and *all* observed variability is measurement error, correlations will be equal across time periods. At the other extreme, when a voter is unstable and there is *no* measurement error, correlations should become smaller at a predictable rate as time periods become more distant from each other. By observing where the data fall between these polar cases, the model estimates the measurement error in each survey question. (Achen, p. 1221)

But there are not *two* poles but at least eight, since each of the three factors A, B, C, may independently be present in varying amounts. Achen's summary is simply bizarre — the (affirmative) evidence for Converse disturbances is a particular pattern of declining (positive) correlations between more distant responses, although Converse made essentially the opposite inference: that declining correla-

tions imply "real" opinions and real opinion change, while constant correlations are to be explained by the black-white model. Strangely, Achen does not discuss this reversal.

Although Achen believes he has combined Converse-type and "true" changes in the u-terms, he has in fact caused C-type disturbances to be included in the estimated variance of the e's. The C-disturbances, like those of type B, are present equally in all sets of observations over time — they do not somehow magically cumulate as do the u's. The role of the u's is indeed peculiar: although their expectations have a simple interpretation (change in the mean of the responses over time), we will obtain large estimated *variances* for the u's only in a rather rare situation: heteroscedasticity in the observations over time, the variance of the observations increasing with the passage of time, for to each successive response is added a new random variable, which Achen generally assumes to be independent of the earlier u's. In the model each respondent sets off on his own random walk in one dimension, and they collectively drift farther and farther apart, a kind of expanding opinion universe. The failure of the data to look this way leads to low estimates of the u-variances, which Achen proceeds to misinterpret. The model is absurd: note how u_1, the "actual" opinion change between time 1 and 2, lies as a sort of mortmain on all subsequent responses, influencing them with undiminished force to the end of time. There are almost inexpressibly subtle confusions here between thinking of the u's as mere algebraic representations of changes, and thinking of them as random variables representing causes.

It is easy to see how a single scholar in the assiduous search for publishable results could create a paper such as this. Nevertheless, and without wishing to indict Achen, his friends or referees, I must say I am alarmed that such a bizarre and misleading model could find its way into print in the *Review*. There are, after all, a number of features of this paper which should cause any alert and careful reader to become suspicious:

(1) We should beware of any correlation of 0.98 in survey data, especially when it arises by "correcting" a correlation of 0.37, so that the vast majority of the relationship *lies in the correction.*
(2) The u's are said to represent changes in "actual" opinions, although Converse's thesis was that many responses lacked the foundations that the word actual ordinarily implies.
(3) The model purports to separate questionnaire vagueness from respondent vagueness, but no substantial explanation is given of how such a surgical separation may be achieved.
(4) The use of correlational evidence is virtually the reverse of Converse's use, again without explanation.
(5) The pattern of cumulation of the u's over time should cause any reader to suspect the model may not be stationary, and may establish $t = 1$, the beginning of the measurement process, as a preferred time with implications for behavior. It does have this fault, and again no explanation is offered.

That so much of this must have been missed by so many readers does indeed suggest there is a bit of vagueness around here—somewhere.

STEPHEN V. STEPHENS
Baltimore, Maryland

TO THE EDITOR:

In his article "Mass Political Attitudes and the Survey Response" (*ASPR*, 69 [December, 1975], 1218–1231), Christopher Achen has added another interesting chapter in the attempt to refute Converse's[1] argument that many of the people who respond to a survey question actually have no opinion on the point asked. Achen takes Converse to task for ignoring the possibility of unreliability or measurement error in survey items. It is perhaps fitting then that we take Achen to task for ignoring measurement error in *his* main dependent variable. In a nutshell the argument to be spelled out in this letter is this: The mathematical model presented by Achen is *not* mathematically inconsistent with the model presented by Converse. Thus evidence in favor of the Achen model is *not* evidence against the Converse model. The only evidence in Achen's paper which might differentiate between the two models is the evidence which Achen cites concerning individual differences in the amount of error of measurement in the survey response. Achen claims that the variability in error of measurement is too low to be consistent with the Converse model. However his evidence takes the form of multiple correlations between an *estimate* of the error for each person and various indicators of political interest and activity. Achen claims that the low multiple correlations which he observes are the result of a nil difference in the size of the errors of measurement from one person to the next. It is our con-

[1] Philip Converse, "The Nature of Belief Systems in Mass Publics," *Ideology and Discontent*, ed. David E. Apter (New York: Free Press, 1964), pp. 206–61. Tufte (Reading, Mass.: Addison-Wesley, 1970), pp. 168–89.

:ention that the low multiple correlations are the esult of unreliability or error of measurement in he variable used by Achen to estimate the size of he error in each individual. We will show that eliability is at best .25 and may be as low as .09. With reliabilities that low, multiple correlations of .10 to .20 represent much stronger relations than is the case for well-measured dependent variables. Moreover, low reliabilities mean an increase in the relative impact of sampling error and hence a greatly lowered probability of finding statistical significance in individual beta weights. Thus if our calculations of the reliability of Achen's dependent variable are correct, then Achen's evidence against Converse is completely emasculated. This doesn't mean that Achen's claims are wrong, it just means that Achen presents no evidence to back up that claim. Actually Erikson[2] has offered *direct* evidence that political interest variables are not related to either test-retest correlations or to correlations between opinions in the SRC data.

Achen's dependent variable

Both Achen and Converse assert that the survey response can be analyzed into two components: i.e., written $x=t+e$, where t is the "true score" or expected answer to a series of hypothetically perfectly analagous questions, and e is a random response component. Converse goes on to assert, however, that people can be broken into two types: those who actually hold opinions for whom $e=0$, $t\neq 0$; and those who actually hold no opinion for whom $t=0$, $e\neq 0$. If we could directly measure the error term e, there would be no problem in testing the Converse model: we would simply tabulate σ_{ei}^2 for individuals i and see if the resulting distribution was bimodal at $\sigma_{ei}^2=0$ and $\sigma_{ei}^2=\overset{2}{e}\sigma$. But alas, the error component cannot be observed for single individuals unless we consider repeated measurements at different points in time, and then we have a confounding between apparent change due to independent errors of measurement and real change in true opinion. Thus the Converse black-and-white model is only asserted to fit perfectly for issues on which there is no change over the time interval considered. Similarly, the Achen measure of response error is only unconfounded with real change if there is none. Fortunately, the test-retest correlations corrected for attenuation shown in Achen's Table 1 show that there is little real change on most of the issues considered in the SRC data.

[2] Robert S. Erikson, "The SRC Panel Data and Mass Political Attitudes," presented at the 1975 Annual Meeting of the American Political Science Association in San Francisco.

Consider the Achen estimate of the response error in an individual subject:

$$s_i = (x_{2i}-x_{1i})^2 + (x_{3i}-x_{2i})^2 - (x_{3i}-x_{1i})^2 + \text{constant}.$$

In the pure case in which there is no change over time in true score, this estimate becomes

$$s_1 = \overset{2}{e_2} - e_1e_2 - e_2e_3 + e_1e_3.$$

This score s_i is not the actual error variance σ_{ei}^2 for individual i but is related to the actual variance in precisely a true-score/observed-score relation. That is, the person's true score on s_i is the average of his scores on a hypothetical series of questions which are equivalent in content but with independently sampled errors of measurement. This average for the Achen estimator s_i is given by

$$\underset{i}{E}(s_i) = \overset{2}{\sigma_{ei}}$$

That is, the true score for s_i is the desired individual response error. However there is random variability in the score s_i produced by the randomness of the errors e_1, e_2, and e_3. The extent of this error is assessed by considering the same hypothetical set of equivalent responses as is considered in obtaining the true score; the error in s_i, however, is not the mean of those scores, but the variance:

$$\underset{i}{\text{Var}}\,(s) = \underset{i}{\text{Var}}\,(\overset{2}{e_2} - e_1e_2 - e_2e_3 + e_1e_3)$$

The scores e_1, e_2, e_3 are the successive response errors for person i. These response errors are independent, identically distributed (if there is no change in true score), and have mean 0. From these facts, we can show that the four components of the score s are uncorrelated (though not independent). For example, the lack of correlation between the component e_2^2 and the component e_1e_2 follows from the calculation of the following covariance

$$E(\{\overset{2}{e_2}\}\{e_1e_2\}) = E(\overset{3}{e_2}e_1) = E(\overset{3}{e_2})E(e_1)$$
$$= E(\overset{3}{e_2})0 = 0$$

The lack of correlation between components e_1e_2 and e_2e_3 follows from the covariance

$$E(\{e_1e_2\}\{e_2e_3\}) = E(e_1\overset{2}{e_2}e_3)$$
$$= E(e_1)E(\overset{2}{e_2})E(e_3)$$
$$= 0\ E(\overset{2}{e_2})\ 0 = 0.$$

Since the four components of s are uncorrelated, the variance of s is the sum of the four variances of the four components. That is, the variance in s for person i is

$$\underset{i}{\text{Var}}(s) = \underset{i}{\text{Var}}(e_2^2) + \underset{i}{\text{Var}}(e_1e_2) + \underset{i}{\text{Var}}(e_2e_3) + \underset{i}{\text{Var}}(e_1e_3).$$

The three product terms all have the same variance (since the errors are identically distributed if there is no change in true scores). The variance in e_1e_2 for person i is

$$\begin{aligned}\underset{i}{\text{Var}}(e_1e_2) &= E(\{e_1e_2\}^2) - \{E(e_1e_2)\}^2 \\ &= E(e_1^2e_2^2) - 0 \\ &= E(e_1^2)E(e_2^2) = \sigma_{ei}^2\sigma_{ei}^2 \\ &= \sigma_{ei}^4.\end{aligned}$$

The variance in the component e_2^2 for person i is

$$\begin{aligned}\underset{i}{\text{Var}}(e_2^2) &= E(\{e_2^2\}^2) - \{E(e_2^2)\}^2 \\ &= E(e_2^4) - \{\sigma_{ei}^2\}^2 \\ &= (\text{Raw kurtosis of } e) - \sigma_{ei}^4 \\ &= \sigma_{ei}^4(\text{standardized kurtosis of } e) - \sigma_{ei}^4.\end{aligned}$$

If we denote the standardized kurtosis of e for person i by K_i, then we have

$$\underset{i}{\text{Var}}(e_2^2) = \sigma_{ei}^4(K_i) - \sigma_{ei}^4 = (K_i - 1)\sigma_{ei}^4.$$

The value of the kurtosis K_i is the only number in our calculations which depends on the actual shape of the distribution of errors for a given subject. In the Achen analysis which preserved the original five point scale, the errors of measurement would usually be assumed to have an approximately normal distribution in which case the kurtosis would be $K_i=3$. However if the data were reduced to a two point, pro-con scoring as was done by Converse, then the kurtosis would be that of a binary variable which would vary with the probability of that binary. The minimum kurtosis would be the smallest possible value for a kurtosis: $K_i=1$ at a probability of .5. For probabilities different from one half the kurtosis increases to infinity near 0 and 1; with a kurtosis of 3 taken on at either a probability of .21 or .79.

We now have the true score of the error estimator s_i which is σ_{ei}^2. The variation of s_i about that true score for person i is given by

$$\begin{aligned}\underset{i}{\text{Var}}(s) &= \underset{i}{\text{Var}}(e_2^2) + 3\,\underset{i}{\text{Var}}(e_1e_2) \\ &= \sigma_{ei}^4(K_i - 1 + 3).\end{aligned}$$

In order to get the reliability of the error estimator s_i we need to consider averages and variances over people. For a given population, the true score variance is given by

$$\begin{aligned}\text{Var}(\sigma_{ei}^2) &= E(\{\sigma_{ei}^2\}^2) - \{E(\sigma_{ei}^2)\}^2 \\ &= E(\sigma_{ei}^4) - \sigma_e^4,\end{aligned}$$

where σ_e^2 is the overall or average error variance in the item response x. The error variance in the estimator s_i is the average of the error variances for each person separately, i.e., the error variance of s is

$$\begin{aligned}\text{Var}(\text{error in } s) &= E(\underset{i}{\text{Var}}(s)) \\ &= E(\sigma_{ei}^4\{K_i + 2\}).\end{aligned}$$

The reliability of the Achen estimator s is then given by

$$\begin{aligned}\text{Rel}(s_i) &= \frac{\text{Var (true scores for } s_i)}{\text{Var (true for } s) + \text{Var (error for } s_i)} \\ &= \frac{E(\sigma_{ei}^4) - \sigma_e^4}{\{E(\sigma_{ei}^4) - \sigma_e^4\} + \{E(\sigma_{ei}^4\{K_i + 2\})\}} \\ &= \frac{E(\sigma_{ei}^4) - \sigma_e^4}{E(\sigma_{ei}^4\{K_i + 3\}) - \sigma_e^4}.\end{aligned}$$

What are reasonable numerical values to expect for the reliability of the Achen estimator? That depends on assumptions about the kurtosis of the error distribution and upon the extent of variance in the individual response variances. For example, in the Achen five-point scoring, the roughly continuous error distribution for each person should have a typical kurtosis of about three. If the kurtosis were uniformly three, then we would have the following formula:

$$\text{Rel}(s_i) = \frac{E(\sigma_{ei}^4) - \sigma_e^4}{6E(\sigma_{ei}^4) - \sigma_e^4}.$$

There is no lower bound on how low this reliability can be, but there is an upper bound. The upper bound would be taken on if σ_e^4 were 0, i.e., if the original responses were all perfectly reliable. Thus setting σ_e^4 to 0 in the equation above yields an absolute upper bound on the reliability if the kurtosis is three:

$$\text{Rel}\,(s_i) < \frac{E(\sigma_{ei}^4)}{6E(\sigma_{ei}^4)} = \frac{1}{6}.$$

That is, the most reasonable estimate of the reliability of Achen's response error score is that it is somewhere less than .17. How much lower? That depends on the extent of the variability in the error variance from subject to subject. To the extent that Achen's main contention is true, there is little variation in σ_{ei}^2 from one subject to the next and hence the value of σ_e^4 would be very nearly as large as $E(\sigma_{ei}^4)$ and the reliability of the estimator score s_i would be very near zero.

What is the maximum reliability of the Achen response error estimation score s_i if we consider all possible statistical distributions? Believe it or not, the Achen estimator would be at its largest if the Converse black-and-white model were true! Assume that the black-and-white model is true and that half the population holds an opinion while half the population has none. For this Converse model, we have

$$\sigma_{ei}^2 = \begin{cases} 0 \text{ if person } i \text{ holds an opinion} \\ \sigma^2 \text{ if person } i \text{ has no opinion.} \end{cases}$$

The true score variance of s_i is then

$$\text{Var}\,(\sigma_{ei}^2) = \frac{\sigma^2}{4}$$

For binary scoring, a person who has no opinion has an error distribution with kurtosis of one. Thus

$$\underset{i}{\text{Var}}\,(s) = \begin{cases} 0 \text{ if person } i \text{ holds an opinion} \\ 3\sigma^4 \text{ if person } i \text{ has no opinion} \end{cases}$$

The error variance of the estimator s_i is then given by

$$E(\underset{i}{\text{Var}}\,\{s\}) = \frac{0 + 3\sigma^4}{2} = \frac{3}{2}\sigma^4.$$

Finally the Achen response error estimation score s_i is given by

$$\text{Rel}\,(s) = \frac{\frac{\sigma^4}{4}}{\frac{\sigma^4}{4} + \frac{3}{2}\sigma^4} = \frac{1}{7}.$$

To generalize this, let the proportion of persons who hold an opinion be p while the proportion of persons who have no opinion is denoted $q = 1 - p$. Then the reliability of the Achen estimator is given by

$$\text{Rel}_p\,(s) = \frac{pq\sigma^4}{pq\sigma^4 + 3q\sigma^4} = \frac{p}{p+3}.$$

As the number of persons who hold no opinion shrinks to zero, this reliability approaches the highest possible value for the Achen estimator, namely $\text{Rel}_1(s) = .25$.

What would Converse predict for the reliability of Achen's estimator? Converse never says just what portion of the population he believes to be in the "elite" category, but we can make estimates from other numbers which he does discuss. For example, in the original black-and-white model he presents an estimate of $r = .47$ for those who were constant on the first two observations of their attitudes. A little algebra shows that this implies that the proportion of persons who hold an opinion must be 31 per cent. The corresponding reliability would be .09.

Achen's multiple correlations

In response to our prepublication letter, Achen simply reiterated Footnote 20 which admits the existence of measurement error in his estimator, but claimed that it makes little difference. Consider, however, that Achen reported a range of .11 to .19 in his multiple correlations between estimated error s_i and composites of sophistication measures. Even if the reliability of his error estimator were as high as .25, it would mean that the multiple correlations corrected for attenuation would increase to a range of .22 to .38. Moreover, had a perfectly reliable measure been used, it is likely that the number of significant multiple correlations would have risen from 3 out of 8 to 8 out of 8.

In fact, if Converse is right then his data tend to suggest that the proportion of persons who have no opinion is not near 0 per cent, but is more like 69 per cent. If so, then the reliability of Achen's measure would only be .09. Correction for attenuation would then raise the multiple correlations from a range of .11–.19 to a range of .37–.63 and that would be very respectable for the Converse model.

It is our conclusion that although Achen's analysis was very sophisticated, it was vitiated by a failure to consider the reliability of his main dependent measure. The upshot of this error is that it leaves no evidence which tends to contradict the Converse model.

JOHN E. HUNTER
T. DANIEL COGGIN
Michigan State University

To The Editor:

The nonattitude hypothesis of Philip Converse is one of the most important developments in political science in recent years both because of its implications for the methodology of survey research and because of its relationship to democratic theory. I was pleased, therefore, to read the article by Christopher H. Achen in the December 1975 *APSR* titled "Mass Political Attitudes and the Survey Response" (pp. 1218–1231). Achen has given the discipline an alternative hypothesis to explain the Converse panel data: measurement error due to the ambiguity of the survey items.

However, Achen has not shown to my satisfaction that his explanation is a better way of accounting for the essentially random variation found by Converse. Perhaps I have missed something in his article, or misunderstood his model. If so, I am sure I will be corrected.

The heart of the Achen argument is found on page 1221. He states: "By the nature of the assumptions, all sources of observation error are implicitly counted as 'measurement error.'" Although he is referring in this passage to other kinds of error, such as assuming interval level data, the statement indicates what his mathematical notation confirms: that he is begging the question.

Achen has given us a method of separating out real attitude changes from random variations. This may be an advance over the Converse "black and white" model which assumed that respondents were absolutely stable in their opinions or picked the answers to Likert-type survey items at random. Thus by using the methods given by Achen we can see that the proportion of individuals giving random responses was not as great as Converse suspected. There still remains, however, a large group of individuals who are responding in an essentially random fashion. I cannot determine how Achen can tell whether these people are responding in this way because they do not understand the question or because they do not have an opinion on the question (nonattitude). Achen seems to have "assumed" that this variation is a product of question nonintelligibility.

Nor are his references to the social psychology literature on this subject very helpful. The tests which these folks use to determine reliability such as split-half, test/retest, and manipulation of shades of grey are not possible with the Converse panel data.

While Achen's computations will not help us determine whether the random responses are a product of item ambiguity or nonattitudes, the rest of his article sheds some light on this subject. It seems to me the low rate of random response on the party identification question shows, as Converse argued, that the cause of these strange responses is nonattitudes. If the voter can understand the difference between being a "strong" Republican and just being a regular old run-of-the-mill one, why can't they differentiate between strong and weak agreement on issues? Similarly, if the respondents seem able to understand the idea of "leaning" toward the Democrats, they should be able to comprehend issue questions.

On the other hand, the high level of random response to the church attendance question would seem to indicate that item ambiguity is the villain. The church attendance question seems to be much simpler than the issue items, and Achen is certainly right that such behavior is quite stable over time. So we have a rather mixed record on this point.

The regression results reported in the article are not much help either. Achen is correct when he indicates that Converse seems to base his mass/elite distinction on education or perhaps socioeconomic status in general. Thus the finding that random responses are not greater among those with little education seems, at first glance, to be evidence against the nonattitudes hypothesis. But this is cold comfort for the alternative item ambiguity argument. For the inability to comprehend fairly simple Likert items is surely related to education. In fact, I would argue that the Achen hypothesis is severely damaged by his regression results.

It is fairly easy to make the nonattitude hypothesis coincide with the Achen regression results. It seems likely to me that the formulation of attitudes on particular issues is not a product of education but a matter of interest. People have nonattitudes not because they are dumb but because their interests lie elsewhere. It is only the arrogance of political scientists which causes us to assume that people who are smart and well educated are more likely to share our concern with the political aspects of life in all instances.

If the random responses in the Converse panel data are the result of item ambiguity, that ambiguity might arise primarily from the differences between "agree" and "agree strongly" and between "disagree" and "disagree strongly." Achen suggests that this may be the case (p. 1220). I for one would certainly think that these measures of "strength" resemble the "shades of grey" choices used by C. H. Coombs

in his book, *A Theory of Data*, cited by Achen. It would be fairly easy to test for this possibility. Achen, or someone else who has access to the data, should collapse the responses into a simple trichotomy (agree, indifferent, and disagree) and apply appropriate statistical tests to see if the tendency to respond at random decreases greatly or disappears altogether. If it does not, this would seem to be additional evidence for the nonattitude hypothesis. I cannot believe that the "zone of greyness" around an individual's "most-preferred point" can extend from agreement to disagreement on these SRC questionnaire items. If it does, then I would argue that the real most-preferred point is indifference, which is more or less what the nonattitudes hypothesis posits.

My conclusion at this point is that at least some of these random responses are a product of item ambiguity and at least some are a product of nonattitudes. I suspect both Converse and Achen would agree. The question is the relative proportions of each kind of error source. There is no reason to believe that the proportions do not vary from question to question and from sample to sample in ways that are at this point unclear. The implications of this conclusion for survey research are the same as they were following the original Converse work. If we wish to measure attitudes on issues accurately, we will have to go to the extra trouble of using open-ended questions. And we will have to suffer the inconvenience of receiving responses that are ambiguous because of the variety of responses. We will have to search for new structures to give order to these responses. The implied structure of Likert items and additive scales does not reflect the reality of public opinion.

The implications of the nonattitude hypothesis for democratic theory are important, but in my opinion not as extreme as Achen suggests. My reading of Converse does not convince me that he believes the failure of an individual to have attitudes on one particular issue means he or she does not have attitudes on other issues. And democratic theory does not demand (recently) that the voter have an attitude on all issues, only that he or she have an attitude about some issues and vote accordingly. My own peculiar view of "democracy" is even less restrictive. I believe in the absolute right of political abstention (an activity that seems more and more reasonable). If one does not really care about things political, why should his or her participation be necessary for the fair and civilized process of decision making by everybody else? As long as the individual can move in and out of the political arena freely, why is lack of participation by the uncommitted important? In fact, such nonparticipation helps to solve some of the problems of "intensity" pointed out by Robert Dahl in his *Preface to Democratic Theory*.

THEODORE S. ARRINGTON
University of North Carolina at Charlotte

TO THE EDITOR:

Let me begin by concurring with Professor Stephens that in the *first* part of my discussion of "measurement error," I did not try to distinguish culpable vagueness from vagueness due to question wording. It is not statistically possible to do so in the first simple model I presented, so I temporarily lumped them together as part of the *e* terms (the measurement error). Indeed, later in the article, I state this explicitly: "Might it not be that this 'measurement error' is really a simple matter of not understanding the question?" (p. 1226)

Having used the first part of the article to separate real change (Stephens's type A) from measurement error, I then spent the final third of the text trying to disentangle culpable and nonculpable vagueness (Stephens's types B and C). I argued that if we are to assign "blame" for vagueness, we need some standard of judgment. For example, if we ask whether Hegel is inherently vague or merely difficult, we use the judgment of persons well acquainted with the subject matter. For survey questions, we may ask whether political sophisticates have less difficulty with the questions than the uninformed. To investigate this issue, I compared the estimated measurement error (the total of B and C) for well-educated citizens interested in politics, etc. with the error for the less educated, concerned, and so on. When these groups turned out to have similar average scores, I concluded that acquaintance with the subject matter did not seem to help much, and therefore most of the vagueness was probably due to the questions.

Mr. Stephens simply misinterprets the *u* terms (which are composed solely of real opinion change), and he seems to have overlooked the latter part of my paper entirely. His critique of the first part — that I do not distinguish types B and C — recapitulates my own criticisms on p. 1226, and I have no quarrel with it. I simply wish he had read on.

Most of Mr. Stephens's other complaints

about my work are based on mistakes in arithmetic. Three examples:

(1) He argues that my model forces real opinion change to appear small. Statistically speaking, he claims that the u terms are required to have small variances if the variance of the observations does not increase over time, e.g., that if $var\ (p+u_1) = var\ (p)$, then $var\ (u_1)$ must be zero. But of course, $var\ (p+u_1) = var\ (p) + var\ (u_1) + 2cov(p,u_1)$, so that it is perfectly possible for $var(u_1)$ to be large even if $var\ (p)$ and $var(p + u_1)$ are equal. We require only that p and u_1 be allowed to be negatively correlated, which indeed they were in my estimates. Mr. Stephens was no doubt thinking of the situation in which p and u_1 are uncorrelated, but I made no such assumption.

(2) He writes that I assume that all respondents behave the same. This is like saying that the calculation of a mean requires that we assume all individuals sampled are identical in score. In my estimates, with one exception, all the quantities needed are simple sums of individual scores, and the exception (the term, $E(x_2\text{-}x_1)E(x_3\text{-}x_3)$) reduces to a similar calculation if the expected true opinion change is the same across individuals. (This requires some similarity among respondents, but not too much.) Then, since the individual-level calculations are unbiased estimates of individual's measurement errors, so also is the sum an unbiased estimate of the *average* measurement error. Professor Stephens is surely familiar with the following result from the ordinary regression case: under fairly general conditions, we can interpret regression coefficients as estimates of the average coefficients in the sampled population, and there is no need to assume that every individual has the same true coefficients. The same kind of argument applies here. We can interpret my estimates as averages without requiring anything like perfect homogeneity.

(3) Mr. Stephens believes I am making a substantive assumption when I measure real opinion change from the position at the previous period, which makes the term u_1 appear at each time period. He says: "Note how u_1 the 'actual' opinion change between time 1 and 2, lies as a sort of mortmain on all subsequent responses, influencing them with undiminished force to the end of time." This is roughly like saying that making the unit of distance the foot influences all subsequent calculations of distance. Of course it does, but distance is still distance. It is perfectly possible here to rewrite the model so that u_1 appears only once, namely at time 2. Substantively, this means measuring opinion changes from the position at the *first* (rather than the previous) time period. If we rewrite all the old assumptions (Mr. Stephens doesn't suggest any new ones) in terms of these new measures, all the estimates will be the same as before. The difference is cosmetic. (I might add that Converse and I draw precisely the same conclusion when correlations among the observations decline over time: that real change has occurred.)

Finally, I should make it clear that I have no desire to defend my article to the last word. Some of the assumptions (mostly those Stephens doesn't mention) are very approximate, and the regression approach to separating the two kinds of vagueness is clumsy. Models are to be used, not believed; and they should be discarded when other scholars show how they can be superseded by other, more general approaches. John Jackson and Robert Erikson have both pointed out relevant difficulties in my procedures, and go on to improve and extend previous work with new models but, happily, similar conclusions. Similar findings or not, criticism of that sort can only be applauded. Among Professor Stephens's remarks, by contrast, the calmer and more accurate consist in reminding us that our models are far from perfect; and that is pretty tame stuff.

My comments on the other two letters are brief. Hunter and Coggin have performed interesting calculations to estimate the upward adjustment in R^2 that would occur for my regression results were the measurement error in the dependent variable corrected. Their findings are no doubt worth having, but they are irrelevant to my argument in the article. Contrary to these authors' belief that I based my case upon the R^2, I wrote precisely the opposite: "In fact, however, multiple R's and significance levels provide very little statistical evidence for the hypothesis in question (or, indeed, for most social science hypotheses)" (p.1227). I went on to make the point Hunter and Coggin raise, that the R^2 is biased downward, but I added that the regression coefficients were the relevant statistics and that they remain unbiased in the presence of measurement error in the dependent variable (footnote 20). Thus it is quite unimportant how much larger the R^2 should be; my argument, founded on the regression coefficients, would be unaffected.

Finally, I feel that Arrington's suggestions and speculations are interesting, and I am in sympathy with many of his remarks. Let me simply suggest one correction. As I mentioned in replying to Stephens, the dependent variable in the regression incorporates both item ambiguity and failure to understand the question. Thus if a variable like education or interest in the election influenced comprehension and comprehension were the major part of the dependent variable, "measurement error," as Arrington believes, then the variable should have

a large coefficient in the regressions I calculated. Neither these two nor any other variables possessed such a coefficient, and I therefore concluded that measurement error was mostly item ambiguity.

Arrington's intuition suggests that an individual can be vague between "agree" and "strongly agree," but not between "agree" and "disagree." If true, this hypothesis would certainly make possible far simpler discrimination between non-attitudes and item ambiguity. In fact, I tried for other reasons the test Arrington suggests (namely, collapsing the ends of the scale — see footnote 14) and found that measurement error was not much altered. On Arrington's view, the error must then be composed largely of non-attitudes. But of course this implication depends heavily on the supposition that vagueness never extends past the middle of the scale, and that postulate is in need of further research. For the present, my own intuitions are too vague to let me "agree" or "disagree."

REVIEW ESSAYS

Government and the Media*

ITHIEL DE SOLA POOL
Massachusetts Institute of Technology

The decline in public confidence in all institutions (the presidency, the Congress, the churches, business, education, and the press) stimulates evaluative literature about each. This review examines recent literature on the press.

The crisis of legitimacy is worldwide, so its causes are presumably also global. Consider some commonly offered explanations and how they apply to the press.

The demands for expanded participation in power: Addressed to the press, this claim is a demand for "access." Despite rebuff by the Supreme Court in the Tornillo case concerning the right of reply for a candidate (41 L. Ed. 2nd 730, 1974), there have been increasing calls for changing the concept of freedom of the press from that of a property right of media owners to a right of citizen access.[1]

Acceleration of social change (what Toffler calls future shock): Mass newspapers circulated for a century before radio and movies, but the latter reigned for only a quarter century before TV took pre-eminence as the public's news source, and now a quarter of a century later TV is beginning to face pay-TV, CATV, cassettes, and video recorders. Time, the great bestower of legitimacy, is hardly allowed to operate.

A general decline of illusions: High prin-

ciples are debunked by exposing the "real" motives behind them. Legitimizations of authority such as the journalistic claim to objectivity are challenged, for example, by psychoanalysis, sociology, or agnosticism.

Rising moral standards: Just as campaign practices that were once usual are now scandals, so yellow journalism is increasingly a thing of the past. Newspapers are now criticized if they are not balanced and probing — something few papers have ever been. There is a revolution of rising expectations.

These processes of delegitimization help account for the current spate of critical literature about the media of communication; attacked by some as sources of dissent, the media are labeled by others as establishment apologetics. In a polarized society any institution is berated by true believers from each side for not serving the truth as they see it.

Another factor behind the growing interest in the political role of the media in this country has been the decay of the class-based New Deal coalition that since 1932 shaped American politics. For a quarter century the central political debate was about social reforms proposed by the national Democratic leadership. For many voters the posture of that leadership provided a decision rule for issues. About three fifths of the California public had no trouble telling pollers whether they were for or against the (nonexistent) Metallic Metals Act; it was enough that it sounded like New Deal legislation. In the 1970s for many voters such an easy rule no longer holds. As class, ethnicity and party have waned as determinants of voter behavior, other forces, such as the media, become residual legatees of political influence. Since 1956, presidential elections have been in large part television shows, along with such other video events as the Army-McCarthy hearings, assassinations, and Watergate. In the 1930s and 1940s election analysts focused on ethnicity, party, and SES as explanatory variables. In the 1960s and 1970s, media campaigns and their imagery (sometimes called issues) have become increasingly interesting to election analysts.

Debate about the media in the hot summers of 1967 and 1968 centered on whether the eye of the TV camera promoted rioting, and also on its effect on the first TV-covered war: Did the media treatment of it betray the government or, alternatively, "the people"? In the first Nixon term, thanks to Spiro Agnew, the debate centered on charges of left-wing-elitism and on the media's reactive fear that a right-leaning government might clamp down on their freedom. In the second Nixon term the debate centered on Watergate; the media believed they saved our constitution, while the losers saw the media as a juggernaut before which even the presidency was helpless.

For political scientists these fleeting dramas in public debate are instances of general issues of political theory. The "adversary relationship" between media and government is an instance of checks and balances, with the media a "fourth branch of government."[2] Each branch has relations of competition, conflict, division of labor, and coordination with each of the other branches. The media supply information to the Congress and the Executive; they enable politicians to mobilize the public; and they criticize or check officials. Political scientists will recognize in the relationship not only adversary roles but also all the classic aspects of decentralized allocation of power including *both* competition and coordination.

Political scientists know the elusiveness of the concept of power, be it political power or the power of the press; it is hard to measure and it is reciprocal between superior and subordinate. Little of that subtlety enters the literature on the media. Its lack of sophistication is illustrated by pervasive use of the notion of "bias." Historiographers and social scientists understand the inevitable incompleteness and bias of any description of the empirical world. Description is selection, and selection applies obscure and value-laden notions of relevance and importance. That applies to reporting in the media too, but is seldom thoughtfully discussed in that context. Often the notion of bias is reduced to the question of whether each of two sides was given equal space. More abstruse matters such as "nonissues" or organizational imperatives that are familiar to political scientists, rarely appear in the literature on the press. Thus, though relevant to political scientists because of their subject matter, the books reviewed here, with exceptions, are faulted as social science analysis.

Organization Theory and the Media

First let us note some exceptions. Three significant books apply organization theory to the media. *Reporters and Officials* by Leon V. Sigal argues that "organizational processes and bureaucratic politics account for more of news content than, say, the political proclivities of

[2] Douglass Cater, *The Fourth Branch of Government* (New York: Vintage, 1959).

individual newsmen" (p. 5). *News From Nowhere* by Edward Jay Epstein relates network news to the organization of the teams that produce it. *Behind the Front Page* by Chris Argyris does likewise for an unnamed but barely disguised *New York Times.*

Argyris, a psychologist, has published case studies on organizational pathologies in business firms, the State Department and now a newspaper. His book is essentially a study in human relations, but it can be read differently by those interested in the social structure of media institutions. It describes the power conflict and mutual misperceptions between the editorial and news departments, and the relation of both to the publisher. An issue that arose during the period of Argyris's observation concerned the establishment of an op-ed page. Despite agreement on it, years went by without action. The news staff wanted it to be their channel for thoughtful interpretive writing, which they craved the opportunity to do. The members of the editorial staff were unwilling to breach the wall between news reporting and their own monopoly on expression of opinion; they opposed the increasingly political impulses of younger reporters. The publisher, in a classic bureaucratic stalemate, was unwilling to impose a divisive decision.

Sigal, Epstein, and Argyris describe how the structure of media organizations affects the content that emerges. Epstein describes how the budget constraint to a dozen camera crews shapes the network news' image of the world; he notes the consequences of the television networks' having few reporters, mostly generalists without close ties to those they cover, unlike newspaper reporters with beats. These authors avoid the naive notion of "bias," while explaining how stories are affected by the processes that generate them. The theme of Sigal's first chapter is "What the News Means Depends on How the News Gets Made." Using *The New York Times* and *Washington Post* as cases, he examines how cooperation, competition, and bargaining in a hierarchical organization with limited resources to allocate "makes" the news. We shall return to these three books later in this review.

Moralism and the Media

One sophisticated treatment of bias is *Press, Politics and Popular Government* (ed. George F. Will), with an essay by Robert Bartley, and thoughtful comments by Irving Kristol, Douglass Cater, and Paul Weaver. Bartley, of the *Wall Street Journal,* argues that the changing recruitment base of journalists from lower middle-class high school graduates to better-off college graduates promotes idealistic liberalism.[3] Irving Kristol, following Walter Lippmann, argues that despite college education, journalists lack the technical expertise to analyze complex matters. They substitute, he says, populist ideological formulae. But Paul Weaver maintains that the definition of the task as much as the character of the men shapes the content of the product; journalism is what Aristotle called epideictic writing whose method is amplification and whose purpose is praise or blame, rather than the deliberative writing for which Irving Kristol asks. The product may be good in its genre, but as analysis the product is "simpleminded moralism."

Journalists writing on journalism are moralistic too. Witness the discussion of "bias" among writers who charge the media with leftist leanings. Edith Efron presents the case best. Anecdotal instances, such as "The Selling of the Pentagon," can support any charge, but what is the overall balance of bias? Edith Efron at least has tried to count. She classified network news coverage of the 1968 campaign pro and anti the two sides and found that the TV news treatment was much more favorable to Humphrey than to Nixon.

Efron's content analysis was challenged in two CBS-commissioned studies, a methodological critique by Charles Winick and an independent content analysis by International Research Associates. Winick scores some points: Efron presents no check on coding reliability. Also "a candidate who conducts a cautious campaign, like Mr. Nixon in 1968, may get substantial favorable exposure which would not be counted at all in a content analysis of expressed opinions because it contained no opinion content."

On the other hand, on most of Winick's buckshot charges one has to rule for Efron. She used only the audio, not the video messages and covered only the 7 p.m. network news, but there is no obvious reason for rejecting that sample. The unpublished INRA content analysis of the pre-election Cronkite broadcasts gives evidence of both a scrupulous network attempt at mechanical equality and also of Efron's thesis of a more favorable treatment of Humphrey. Campaign news stories distributed mentions as follows: Nixon 63 per cent, Humphrey 61 per cent, Agnew 10 per cent, Muskie 10 per cent, other Republican cam-

[3] Cf. also Chandler's comments in Lee, *Politics and the Press,* p. 82.

paigners 13 per cent, other Democratic campaigners 15 per cent. The parallelism hardly seems coincidental. When classified by favorableness, however, "19 per cent of the paragraphs in which Nixon was mentioned were classified as favorable to him, and 19 per cent as unfavorable; the figures for Humphrey are 26 per cent favorable and 17 per cent unfavorable." Note that the neutral proportion was large and that this is less "bias" than Efron found, even though in agreement with her main claim.[4]

Network defenders have used Efron's weaknesses in execution as evidence that the very attempt to measure bias by counting the incidence of "pro" and "anti" items is impossible and evil. Yet the networks do the same thing to prove how systematically they even things up in minutes alloted to each candidate. The issue is not whether counts are possible, but whether they make for good journalism. Any journalistic rule other than deliberate matching will produce uneven coverage of different actors; counting can document the resulting difference.

But is deviation from 50-50 bad reporting? Under FCC regulation TV has to offer equal time to candidates under comparable terms, but that does not apply to news coverage. Are the media failing their duty if one campaign generates better news stories than the other? Should the media misreport reality so as to make the campaign an even contest? In covering scandals should equal space be given to the allegations and to denials by the accused? Should pleas for racial tolerance be balanced by equal expressions of bigotry? Must inculcations of national pride be balanced by masochistic self-denunciations?

Left-wing and right-wing critiques of the media have a common intellectual content, namely that the major media have a definable viewpoint far from their own. They show that the views of those who control the major media are neither randomly distributed nor their preferred ones. Undoubtedly the major media present a specialized picture of reality. One would welcome a study that dispassionately identified the character of newsmen's special perception of reality. Works such as Keeley's, Aronson's, and Cirano's are useful, if at all, only as sourcebooks for anecdotes about improper actions — in Keeley's case by those on the left, in Aronson's and Cirano's by those on the right. Consider, for example, Aronson's *The Press and the Cold War*. Many of the horror stories in it are accurate; the problem is to know which ones. Aronson impressively catalogs advance stories that appeared in the U.S. press about preparations for the Bay of Pigs invasion and how the press downplayed them. He notes the extensive contemporaneous reports on the so-called secret bombing of Cambodia, as well as the unwillingness of the press to argue with government denials. But then he denies that there were North Vietnamese sanctuaries across the Cambodian border or that a Ho Chi Minh trail through Laos existed. Given reporting like that, one can hardly allow much credence where one does not happen to know the facts independently.

Another criticism of the media is that they are corporations for profit with financial and personal links to other firms. One looks in vain for a good book on the implications of that, a book just as preoccupied with surprising findings about the looseness of couplings in the system as with surprising findings about the tight ones.

When that book appears it will use organization theory in noting how imperatives of the job shape the output. The organizational analyses already available (e.g., Sigal, Epstein, Argyris) deal with the editorial side of the news business: how editors, reporters, and video producers do their jobs. Those books do not explore the processes by which publishers raise capital, arrive at business judgments, and relate those judgments to editorial activities. The existing studies show that editorial and business processes are disjointed enough so that those in either world know relatively little about what goes on in the other. The few linking individuals are often immobilized by a conflict of roles. In the newspapers studied by Argyris and Sigal the result was neither financially or journalistically optimal.

The Journalist's Craft

Journalists' books on their professional problems resemble the media accounts based on organization theory in reflecting pragmatic awareness of the complex social and structural constraints on news production and in explaining why journalists do what they do. To understand is to forgive; the faults of the media emerge as consequence of life's complexities. While such books moralize over a spectrum from the defensive to the critical, what is more

[4] The dispute between Efron & CBS became so bitter as to prompt a second book: Edith Efron, *How CBS Tried to Kill a Book*. Los Angeles, Nash Publications, 1972.

important is that they are usually informed accounts.

Their viewpoint is reflected in the title, *To Kill a Messenger,* chosen by William Small, then manager of the CBS Washington Bureau. It alludes to one of newsmen's favorite clichés: when politicians or others complain about media stress on bad news, newsmen reply that the critics have turned their "anger on the messenger, the bearer of bad news." A similar cliché is the metaphor of the mirror. The media, we are told, reflect society; if we do not like the warts that we see, blame society, not the media.

There is little left to that neutral view by the time Edward Epstein finishes dissecting it. The organization of the news staff, economics, and time constraints shape what goes out as news. The news no more exists before newsmen create it than do issues before politicians create them. Whatever the seeds from which the news grows, the institutions of journalism shape the growth mightily.[5]

Small does not question that. Journalist that he is, he reports; he neither asserts nor denies. He relates the great moments of television; the Army-McCarthy hearings, the Checkers speech, the Kennedy assassinations, the 1968 Democratic Convention, the Vietnam War, and the urban riots. His book is a skillful defense of television which lays facts before the reader and lets the reader draw his or her own conclusions. He does not hide violence, the vast wasteland, network retreats before political pressure, and arranged news events such as the "Pot Party." He invites the public to share the existential dilemmas of media professionals who must cope with ratings, sponsors, political pressures, and uncertainty as they perform their job of public information.

Such journalists' books on government and the media, although written well, may be thin as social science. Three propositions sum up the theory in many of them. (1) The media are the people's tribune against government oppression. (2) Hence, media and government are adversaries. (3) A journalist should, therefore, publish whatever he can learn, however damaging to the government. John C. Merrill's *The Imperative of Freedom* argues for such journalistic autonomy as a normative philosophy. Merrill rejects such other journalistic criteria as the people's right to know, serving as a fourth branch of government, providing access to public debate, or professionalism, for these imply a responsibility, not just a freedom for the press. John Hohenberg, in *Free Press/Free People* elevates a similar approach to the organizing principle of a world history. He skips interestingly from ancient Sumeria through the invention of printing and the evolution of the newspaper, to the World Wars and the Cold War with the single theme of the courage of men who were resolved to get the news out. One is baffled by such declarations as "fifty years after Gutenberg, every necessary ingredient of a free press except one was in existence. The missing quality was courage."

Four normative issues loom large in journalists' books on their profession. First, should a journalist ever fail to publish what he knows? Several books here reviewed (e.g., Small's and *What You Don't Know Can Hurt You* by Lester Markel) describe episodes in World War II, the Bay of Pigs, and the Pentagon Papers, in which journalists who possessed secret information had to decide whether to publish it. Similarly, during riots the question arises whether the eye of the camera itself stimulates violence (or the reverse)[6] and whether the journalist should worry about being a causal agent. Such dramatic decisions, while important, are rare. One would like to read more about how reporters' and editors' everyday decisions are governed by such criteria as waiting till the moment is ripe, or until the whole story is at hand, protecting privacy on matters of no public significance, lack of reader interest, or just plain unimportance. Is a Senator's drunkenness a news story or not? The journalistic literature says too little about decisions *not* to publish, except for the dramatic cases of suppression of big stories in the supposed national interest.

A second normative issue concerns newsmen's privilege. Should a newsman have to reveal his sources to a court or grand jury? (That is the subject of Whalen's *Your Right to Know.*) The newsmen's argument (not generally accepted by the courts)[7] is that they must keep sources secret to obtain information for the public. Social scientists find themselves in the same situation. Political scientist Samuel Popkin went to jail rather than identify interview respondents. A pollster should presumably

[5] For a collection of papers on selectivity of reporting on various topics, see Stanley Cohen and Jack Young, eds. *The Manufacture of News: A Reader* (Beverly Hills: Sage Publications, 1973).

[6] Cf. Lang, pp. 153ff. In Lee, ed., *Politics and the Press.*

[7] See Branzburg v. Kayes, 33 L.Ed. 2nd 626, 1972.

take the same stand. But journalists generally argue that the press deserves a special privilege not to be confounded with the claims of scholars. Nonetheless, journalists are divided (exactly as the founding fathers were about a bill of rights) as to whether their privilege is protected or compromised by laws exempting them from testifying. An explicit grant of privilege implies that the granter also has the right *not* to grant.

A third widely discussed question is how far journalists' relation to government should be adversarial. Sigal's description of the many forms of cronyism between reporters and those on whom they report refutes definition of the actual relation as simply adversarial. The usual conclusion, however, is that they *should* be just that. The "clear responsibility" of American journalism, William Rivers says in *The Adversaries: Politics and the Press,* is "to stand as an adversary of government." Rivers nonetheless notes such complexities as the fact that if news is defined as conflict, conflict may be manufactured by reporting rather than just reported (p. 243). I have criticized the simple adversary notion in a contribution to the *Aspen Notebook on Government and the Media* (for that reason not reviewed here). That is a minority view among journalists; the prevailing view among journalists is that departure from an adversary role is corrupting. Sound or not, that belief is one source of the crisis of legitimacy or both government and the media.

A fourth normative issue that bothers newsmen is where, when, and how much their work should be criticized. Their usual justification for their profession is the value of criticism to society, but like most of us, they take criticism of themselves to be another matter. Lee Brown's *The Reluctant Reformation* presents a history of news criticism, including muckraking exposes, such as Upton Sinclair's *Brass Check,* professional codes such as ASNE's canons, reviews such as A. J. Liebling's columns in the *New Yorker,* as well as the more recent growth of journalism magazines (most notably the *Columbia Journalism Review),* and the institution of ombudsmen on some newspapers. He describes the formation of the National News Council, a citizen panel which issues findings on cases of alleged press abuse. Many, if not most journalists deplore such institutions. They see in the sanctionless News Council, whose judgments are but the free expression of views of some private individuals, the thin edge of a wedge of regulation. When public officials berate the press the usual press rejoinder is to charge a chilling effect on press freedom. Is not freedom of expression valid for those who criticize the press?

Beyond Journalism

The journalists' literature on journalism raises important issues, whether or not one accepts the answers. What is missing is something which has been at the heart of modern social science, the attempt to explain behavior in terms other than those of which the actor is himself aware. Microeconomics predicts an equilibrium different from any businessman's expectations. Dynamic psychology uses unconscious reactions to earlier experience to explain behavior. Voting models predict outcomes by variables other than the purposive campaign moves of the protagonists. Budget simulations are interesting because they deny that politicians' programs make much difference. The journalists' literature on journalism is mostly phenomenological reportage of what journalists think they are doing. Social scientists want a literature that explains journalists' behavior by variables of which the subjects themselves may be only partly conscious.

Three books already mentioned — Epstein's, Sigal's and Argyris's — meet that test. Media people do not like them because their authors do not share the newsmen's own perceptions of themselves; no one enjoys hearing his behavior explained in ways at odds with his own rationalizations.

A similar book from 1968 is *Politics and Television* by Kurt and Gladys Lang.[8] The Langs skillfully improvise quick but rigorous research on current events, documenting thereby how organizational and mechanical imperatives of TV coverage shape what reaches the viewer. In one nominating convention they observed how different network decisions on mechanics of coverage resulted in quite different portrayals. Their best-known study was of the return of MacArthur from Korea after he was fired by Truman. A TV camera van led the general's limousine down Chicago streets, photographing cheering people. For those standing at any one corner on the sidewalk the cheering was a minute's brief ebullience as the limousine went by. It was the camera's aggregation of those brief moments into a sustained clamorous ovation that made the news event.

A useful book representing another social research tradition is Jeremy Tunstall's *Journalists at Work,* which analyzes the careers and

[8] Chicago: Quadrangle Books, 1968.

roles of 207 British specialist correspondents, their organizations, news sources, and competitive and collaborative relations. The author's basic instrument is a lengthy questionnaire covering recruitment, career line, motivations and satisfactions. Tunstall notes such organizational issues as the fact that only about one-tenth of the news reported finds its way into print, but mostly analyzes the professional orientation of journalists.

A popular subject of political campaign research in 1976 is the role of the media. That is a marked shift from the 1950s and 1960s, when election studies tended to minimize the media. Whatever conclusions are about to be reached concerning the media's effect on voting, they certainly do affect campaign styles. Gilbert, reviewing presidential campaigns from 1952 through 1968 notes how strategy has shifted from organizational maneuvering to direct television presentation of the candidate to the mass public. Television has also profoundly affected the manner of the presidency, offering unprecedented opportunities and temptations for charismatic leadership. Minow and his colleagues examine the changing practice of presidential press conferences and coverage with an eye to reforms.

Some Classic Formulations

Several older works anticipate much of what is being said today. Little was added between 1940 and 1970 to the insights already offered by George Simmel, Robert Park, Lincoln Steffens, Leo Rosten, or Walter Lippmann. As Tunstall notes, among organizational studies by 2,000 authors listed in March's *Handbook of Organizations* (1965), only one, Warren Breed's "Social Control in the Newsroom" (*Social Forces* [May, 1955], 326–335), dealt with the press. David Manning White's study of "The Gatekeeper" (*Journalism Quarterly* [Fall, 1950], 383–390), analyzed what the editor chose to publish and what to spike. Douglass Cater's *The Fourth Branch of Government* (Boston: Houghton Mifflin, 1959), and Bernard Cohen's *The Press and Foreign Policy* (Princeton: Princeton University Press, 1963) examined the role of the press in the Washington scene. Cater's book is most notable for its identification of the press as a channel of communication essential to the management of government itself. Cohen deals, as do the later organizational analysts, with the reporter's job, his problems in getting and explaining foreign policy news, his interaction with policy makers, and the perceptions and use of the press by policy makers. Rosten in 1937 delineated the social system and psychology of *The Washington Correspondents* and their relationship to the men of power whose anterooms they inhabit. Earlier, Lincoln Steffens in his *Autobiography* (1931) described a symbiotic relation in which the newsman holds back some damaging things he knows about a politician as blackmail to obtain cooperation and information.

Still earlier, Walter Lippmann opened up most of the current issues about politics and the media (*Liberty and the News*, 1920, and *Public Opinion*, 1922). Lippmann's views, as recently presented by John Luskin, in *Lippmann, Liberty and the Press*, are often at odds with the accepted catechism of American newsmen. Lippmann was not a libertarian. He supported censorship in wartime, objected to obscenity, castigated yellow journalists for invading the privacy of public figures, and argued that the usefulness of journalistic crusading (now called investigative reporting) was over; what he preferred was informed analysis. He also argued against open diplomacy and destruction of administrative confidentiality. "In 1951," Luskin tells us,

> when Congress proposed to investigate the conduct of the Korean War and to publish secret papers of the Joint Chiefs of Staff, the proposal to publish, Lippmann said, though based on "the sacred right of the people to know all the facts," could result only in eventual concealment and falsification. Aware that letters they wrote, that memoranda and documents they signed might soon be publicized, officials would eventually utter words which would look good in print (p. 43).

Regardless of the current unpopularity of Lippmann's conclusions, one must admire the perceptiveness of his analysis of the forces operating on news production.

His treatment of stereotypes is still well remembered. Less remembered is what Luskin calls "his dissection of the press apparatus." Lippmann distinguished news from truth. "While the press can report the news well or badly, it can report the truth scarcely at all. The function of news is to signalize an event, the function of truth is to bring to light the hidden facts, to set them in relation to each other' " (p. 53). Lippmann analyzes factors in newspaper production, the pattern of recruitment, the economics of mass publication, competition, and the pressure of deadlines which restrict the press to reporting stereotyped fact. He ends by appealing for a greater role for the analyst, for the expert political scientist engaged in elucidation rather than crusading.

'The press," he said, "is like the beam of a earchlight . . . Men cannot do the work of the vorld by this light alone." "For other, less efractory light," Luskin says, Lippmann "sug-gested his favorite source of revelation, cadres of experts, proposing the establishment in each of the ten federal departments . . . of intelligence services divorced from policy makers" (p. 54). Today we call these think tanks.

Does social science analysis provide an antidote, as Lippmann believed, for the alienated, disruptive character of the press's reflection of society? One wonders. Perhaps if social scientists do not act with the social objectivity that Lippmann's ideal-type suggests, it may be because few of them have the social role and recognition that Lippmann proposes.[9] Those who come nearest to that mandarin-like status are working in places like Rand or the Council of Economic Advisors. The little available evidence on the personal political views of newsmen (cf. Epstein and Tunstall) and of academic social scientists (cf. Lipset) does not suggest systematic political differences between them. Yet independently of their own self-consciousness, perhaps differences arise from the organizational structure in which they are placed. Differences in their product may reflect differences in their degree of autonomy, their criteria of evidence, the impulse towards value-detachment among social scientists and toward moralism among journalists, or the frequent assumption of policy responsibility by social scientists in place of the adversary posture of the journalist. Such differences led Lippmann to view social research as less socially abrasive than journalism.

Lippmann argues, in effect, that while journalism contributes to a crisis of legitimacy, political science fosters healing. In the language of social critics, that distinction would be phrased as degrees of capture of each by the establishment. Regardless of the language used, Lippmann's point remains to be proved.

Books like Epstein's, Sigal's and Argyris's may start a serious effort to understand the journalist's role in relation to the political process: but a comparison of journalism's role with that of other intelligence professions such as social science remains to be made. The pattern of rewards in each profession is quite different. University professors of political science have in the past been paid more money and given more respect, more job security, and much more autonomy, but journalists have been given more access to public officials, and more recognition of their right to information. How each profession contributes to society's ability to function coherently or to the exacerbation of relations within it remains unclear.

Détente, Arms Control and Strategy: Perspectives on SALT*

COLIN S. GRAY

Hudson Institute

The books reviewed in this article demonstrate that strategic studies are today in a condition of conceptual contention and even innovation.[1] The purpose of this discussion is to explore some of the more important issues of strategic weapons and arms control policies as they are affected by the ongoing SALT process and as they are understood from the perspective of arms control theory and arms race management. The central questions that are posed throughout this analysis are, in general, "What do strategists think that they know about the interstate arms race and arms control adversary?" and, in particular, "What conceptual presuppositions are American strategists employing in assessing Soviet arms behavior and options for United States' strategic and arms control policies?". No review of "frontier" literature on the subject of the Soviet-American arms race and related matters can be policy-neutral; certainly no such claim is advanced here. Indeed, one persisting source of analytical weakness in strategic studies has been the under-recognition of hidden premises, tacit theories and communal biases that have, of necessity, colored analyses and policy recommendations. All strategic analysis is "interested" analysis.[2]

The works discussed in this article are addressed, at root, to one or more of the following questions: What drives the nuclear arms race? What does the record of 1958 to 1974 tell us concerning the nature, dynamics and purposes of arms control negotiations? What are the criteria of a desirable strategic posture for the medium and long terms? In what ways do Soviet strategic concepts, negotiating practices, and policy-making processes differ from those of the United States and which differences matter, and in what ways? In fact, a good proportion of the works here considered — and certainly of the reawakening journal literature — is not concerned explicitly with the systematic thinking through of problem areas in strategic studies. Rather is it devoted to policy appraisal, policy prescription, and what may politely be termed prophecy. These works are discussed on the basis that they typify contemporary strategic and arms control theory. It is my intention to explore theoretical concerns which transcend the shifts in focus in the more explicitly prescriptive literature. Although many of the books and articles discussed here were published several years ago, their relevance to theoretical understanding is in no important way diminished by that fact.

Prophecy is understood to refer to prognoses that do not rest upon systematic analysis. Even if a policy maker does not begin to understand how, for example, the Soviet system functions with respect to strategic policy processing, he might still predict future Soviet policy quite accurately because of his native wit, his general knowledge of international behavior, or his "feel" for the clearly emerging choice situations of the Soviet leadership. The inspired official prophet, however, should be able to make better use of his intelligence, his

general knowledge, and his empathy, if he also understood the intellectual structure of his subject. American policy makers neither have understood the nature of the arms race that they were seeking to conduct and control, nor have they confounded this condition of ignorance by means of inspired accurate guesswork. Ideology has tended to occupy the space that should be filled with knowledge of the arms race adversary. When in doubt — as, for example, over Soviet intentions vis-à-vis SALT — all too few analysts have demarcated frankly a region of ignorance; instead Western ideas have been projected upon Soviet officials.[3]

The SALT exercise may be said wonderfully to have concentrated strategic minds. SALT has promoted a long overdue attention to the "arms race phenomenon," and has encouraged a widespread skepticism concerning the historical accuracy of erstwhile-presumed "driving forces."[4] Also, SALT has provided a well-nigh ideal forum for that "strategic dialogue" that many arms controllers believed would promote conceptual convergence and hence — probably a *non-sequitur* — parallel, mutual arms race restraint.[5] The trinity of "Détente, Arms Control and Strategy" in the title of this article reflects the fact that there are strategic and political analysts who tend to focus upon one to the relative neglect of the other two. As Ian Smart has explained, most Western European strategists and politicians value SALT as an instrument of political, rather than strategic, détente.[6] The small print of missile trade-offs and, indeed, even of United States targeting strategy, is deemed to be strictly of secondary significance provided two conditions are satisfied. First, the American security connection with NATO-Europe must continue to be seen to be firm; second, special NATO-European interests must not be the subject of exclusive superpower negotiation.

Next, one finds arms control advocates who are relatively unimpressed with whatever political confidence SALT I and SALT II may have engendered; they desire arms control agreements that do more than appear to promote a fragile political détente. According to the classical criteria, arms control should contribute signally to the diminution of the risk of war occurring; to the reduction of the probable damage likely to result from war; and to the reduction of the costs of defense preparation. The arms control technician, logically if narrowly, is unimpressed with such a *pro forma* arms control flourish as the SALT agreements of June 1974. He is similarly uninterested in many of the more usual criteria for a good — or, perhaps, a better — strategic posture. The SALT agreements on further restricting ABM deployment (to one site only) and the provision of a 150-kiloton "threshold" for underground nuclear tests were held to be strictly cosmetic, and if anything mildly supportive of the strategic arms race. Nevertheless, the "arms control should be about arms control" school of thought damned the Vladivostok accords of November 1974 with faint praise. *Arms Control Today* and the *Bulletin of the Atomic Scientists* left their readers in no doubt that Vladivostok was not very promising as an arms control event — whatever it might or might not accomplish for détente.[7] The aggregate ceilings on strategic offensive forces and on MIRV launchers were too high (at 2,400 and 1,320 respectively), while the defense communities of both superpowers could continue to pursue qualitative improvement without any serious let or hindrance.

Finally, there are analysts who approach SALT in particular and arms control in general, almost solely with a view to improving a national strategic posture. Three different problem areas are addressed by the adherents to the three schools of (1) "SALT must succeed" — in aid of general political relations; (2) "SALT must produce meaningful measures of arms control"; and (3) "SALT must enhance or, at least, not detract from the effectiveness of our strategic posture." Though on very different grounds, school (3) has been scarcely less discontented with the Vladivostok framework agreement than has school (2). After all, Vladivostok endorsed a Soviet strategic postural transition from zero to 1,320 MIRV launchers — in a context of an American MIRVable (land-based) missile throw-weight of 2 million pounds, compared with an easily predictable Soviet throw-weight of 12 million pounds. Vladivostok prevents the United States from chasing the total Soviet throw-weight advantage: American throw-

[3] This argument permeates Gallagher and Spielmann.

weight could not be augmented on a large scale before the mid-1980s."[8]

Although the protracted SALT experience has lent some urgency and focus to strategic issues, the renewed public debate over nuclear strategy reflects also the "ripening" of technological possibilities,[9] the personal convictions of particular public men, and the state of the Soviet-American strategic balance.[10] The essentiality of SALT for the revival of innovative strategic analysis cannot be demonstrated. It is more likely than not that the Soviet weapons programs that have been publicly cited as the catalyzing agents for American strategic postural revision, would have proceeded either with or without SALT.

There can be no strictly military-strategic analysis of the prospects for SALT. Interstate arms control negotiations and agreements reflect synergistic combinations of domestic and of international factors, while many texts on arms control betray an innocence of political considerations.[11] It is easy to dismiss assertions of innovation in strategic theory and analysis. The complexity that confronts an analyst of the nuclear arms race has, item by item at least, been apparent to strategists since the beginning of the nuclear age. For example, it can hardly be a revelation that bureaucrats play games. Nonetheless, resting in part upon an analytical confusion, "bureaucratic politics" is today one of the leading contenders in the arms race analytical stakes — for being *the* driving factor in the arms race.[12] The confusion is that what has been discovered, largely by former short-term academic bureaucrats, was the necessary truth that all large-scale public activity requires bureaucratic activity. Bureaucracy, and hence bureaucratic politics, is a necessary but not a sufficient condition for there being an arms race. I am not implying that "bureaucratic politics" is really just a synonym for bureaucratic activity: those who analyze in this vein have presented a fairly detailed theory of American bureaucratic activity. My contention is that the concept of "bureaucratic politics" promotes a level of analysis confusion. Academic strategists and foreign policy analysts who are sensibly persuaded that the analysis of "bureaucratic politics" has insights of importance to impart, need constantly to ask themselves "what kinds of question can and cannot this mode of analysis answer?"

There is much to recommend the aphorism that "strategic doctrines don't die; they just await the next policy review." While granting the historical recurrence of strategic conceptual debates, and the enduring features of arms races, there are still significant items of novelty to be discovered in present strategic contention. More important, novelty for its own sake has no value. To some degree each new generation of strategic and political analysts must rediscover, with undue fanfare, those nuggets of wisdom concerning, for example, desirable negotiating behavior or a preferred strategic posture, that comprised the intellectual currency of its forebears. Given the laudable quest for innovation that is one of the hallmarks of American political science, it is scarcely surprising that guardianship of past wisdom should often be neglected.[13]

Strategic Debate: The Role of the Scholar

Logical and reasonable arguments abound in the present strategy debate over United States strategic posture. But, in the best — really, the worst — American legal tradition, the issues in dispute are the subjects of the adversary proceedings of countervailing polemics. Damage Limiters, Minimum Deterrers, and Defensive Emphasizers put forward the best case they can make for their own wares. The result, predictably, is a barrage of overstatements. Strategic choice is a political exercise. In the interest of professional soul-purgation, the APSA might consider requiring the more robust strategic advocates among its membership to write a hostile critique of their own, recent *interested* strategic analyses.

The very public debate over the succeeding ABM proposals of the Johnson and Nixon Administrations *appeared* to effect a polarization within the defense/arms control com-

[8] The significance of a large disparity in missile throw-weight is debated in Paul H. Nitze, "Assuring Strategic Stability in an Era of Détente," *Foreign Affairs*, 54 (January 1976), 207–232; and Jan M. Lodal, "Assuring Strategic Stability: An Alternative View," *Foreign Affairs*, 54 (April 1976), 462–481.

[10] See the testimony of James Schlesinger in Senate Committee on Foreign Relations, Subcommittee on Arms Control, International Law and Organization, *U.S.-U.S.S.R. Strategic Policies*, Hearing, 93rd Cong., 2nd Sess. (March 4, 1974), pp. 13–14.

[11] See Stanley Hoffmann, *Gulliver's Troubles, Or the Setting of American Foreign Policy* (New York: McGraw-Hill, 1968), p. 111.

[12] "Bureaucratic politics" may be approached through such works as Graham Allison, *Essence of Decision: Explaining the Cuban Missile Crisis* (Boston: Little, Brown, 1971), particularly chapter 5; and Morton H. Halperin, *Bureaucratic Politics and Foreign Policy* (Washington, D.C.: The Brookings Institution, 1974).

[13] See Hedley Bull, "The Theory of International Politics, 1919–1969," in Porter, ed., *The Aberystwyth Papers: International Politics, 1919–69*, pp. 48–54.

nunity.[14] It is probably more accurate, however, to argue that ABM deployment provided a litmus test issue which required analysts to adhere to their basic reference group. The ABM was a personal identity issue — the specific details of the argument were strictly secondary. In generic terms, one was pro or contra ABM.[15]

To the eventual benefit of all contenders over the protracted ABM issue, the most extreme of the ABM advocates, the Defensive Emphasizers led by Donald Brennan, developed a systematic critique of the extant dominant deterrence doctrine of mutual assured destruction (MAD).[16] Although very few strategic analysts chose to endorse Brennan's proposals for thick urban ABM defenses, to be deployed in the context of an arms control regime requiring a severe reduction in the arsenals of offensive weapons, very few strategic analysts were immune to Brennan's cogent denunciations of MAD doctrine. Brennan anticipated much of the fundamental challenge to orthodox deterrence doctrine that has emerged in recent years. Of considerable interest to future aspiring strategy innovators, is Brennan's belief that one important reason his critique of MAD was taken so seriously was that he was offering a very specific alternative (both conceptually and technologically).

The current debate over strategic forces is focused essentially upon three closely related issues: (1) their character, (2) their size, and (3) their firing and targeting doctrine.[17] Within the arms control community in the United States over the past decade, it has been believed that the political value of strategic forces must derive solely from their military worth. Hence, the pursuit of a militarily meaningless symmetry of strategic capabilities can result in no political rewards.[18] The proper measure for the sufficiency of strategic posture is thus held to be the demographic yardstick of assured destruction. Considered in terms of the threat of surface damage required in order to ensure that the consequences of a retaliatory strike would be unacceptable, it was calculated in the mid-1960s that the delivery of 400 "one megaton equivalents" (EMT) represented the cost-effective level of an assured destruction capability against the Soviet Union. As Alain Enthoven and K. Wayne Smith have explained, 400 EMT represents the "elbow" of the marginal cost curve.[19] Sharply diminishing *returns* (prompt Soviet fatalities and the percentage of Soviet industry destroyed) set in above that level of force loading. As a conceptual brake upon the expansion of offensive forces the assured destruction criterion of sufficiency has much to recommend it. If transposed from the realm of force structure planning into the realm of strategic war planning, however, assured destruction could bias the United States' strategic war plan in the direction of what Herman Kahn has termed a "wargasm" — an orgy of politically and militarily meaningless civilian slaughter.[20]

Closely allied to the conviction that the United States requires only sufficient EMT to devastate Soviet urban-industrial areas, is the notion that some kinds of flexibility in strategic planning are destabilizing. All hard-target (command and control facilities: ICBM silos)

[14] Illustrative of the divisions within the community was the (quite proper) investigation by the Operations Research Society of America of the professional quality of the operations research conducted pro and contra the ABM. See *Operations Research*, 19 (September, 1971). Even more revealing of animosity were the readers' letters in reply. See *Operations Research*, 20 (January-February, 1972), 205–246.

[15] See Herman Kahn, "The Missile Defense Debate in Perspective," in *Why ABM? Policy Issues in the Missile Defense Controversy*, ed. Johan J. Holst and William Schneider, Jr. (Elmsford, N.Y.: Pergamon, 1969), pp. 298–290.

[16] For example, Donald Brennan, "The Case for Population Defense," in *ibid.*, pp. 100–106.

[17] The principal official contributions to the strategy debate are James R. Schlesinger, *Annual Defense Department Report, FY 1975* (Washington, D.C.: U.S. Government Printing Office, March 4, 1974), pp. 3–6, 25–45; James R. Schlesinger, *Annual Defense Department Report, FY 1976 and 197T* (Washington, D.C.: U.S. Government Printing Office, February 5, 1975), pp. I-10–12, 13–17, II-1–11; Senate Committee on Foreign Relations, *U.S.-U.S.S.R. Strategic Policies;* and Senate Committee on Foreign Relations, Subcommittee on Arms Control, International Law and Organization, *Briefing on Counterforce Attacks*, Hearing, 93rd Cong., 2nd Sess. (September 11, 1974).

[18] For example, see Abram Chayes, "Nuclear Arms Control After the Cold War," *Daedalus*, 104 (Summer 1975), 27.

[19] Alain Enthoven and K. Wayne Smith, *How Much is Enough? Shaping the Defense Program, 1961–1969* (New York: Harper and Row, 1971), pp. 207-208. Also see Ian Bellany, "The Essential Arithmetic of Deterrence," *RUSI Journal*, 118 (March, 1973), 28–34. EMT is a measure of the expected surface damage that should be inflicted by a number of re-entry vehicles, expressed as EMT = N.Y. 2/3. N is the number of warheads and Y is their total yield. Useful explanation may be found in Geoffrey Kemp, *Nuclear Forces for Medium Powers: Part I: Targets and Weapons Systems*, Adelphi Paper 106 (London: The International Institute for Strategic Studies, Autumn 1974), p. 26.

[20] Note the observation in Newhouse, p. 266. Former Secretary of Defense Schlesinger contended that, despite the rhetorical attention accorded strategic flexibility over the past decade, until the early 1970s the Department of Defense did not engage in a dedicated effort to program limited strategic use options. See Senate Committee on Foreign Relations, *U.S.-U.S.S.R. Strategic Policies*, pp. 9, 18, 26.

counterforce capability is suspect, because it can only threaten the pre-launch survivability of the ICBM leg of the deterrent Triad of the other side. In other words, it must erode the confidence in its assured destruction capability.[21] These paragraphs have stated the core beliefs of what may fairly be termed the arms control establishment.[22] The Boswell of SALT I, John Newhouse, has written: "Thus, stability, a truly divine goal in the nuclear age, becomes the product of secure second-strike nuclear offenses on both sides. This offensive capability is known as assured destruction; it is the supreme dogma of the ascendant branch of the defense and arms-control communities."[23]

Very few arms controllers do adhere, any longer at least, to what might be termed a pure version of assured destruction doctrine. Partly in response to perceived changes in the state of the strategic balance, most advocates of an assured destruction-emphasizing strategic posture express some concern over the possible political implications of gross numerical and capability disparities. Above all, they deny their critics' contention that they are uninterested in targeting flexibility.[24] Straw targets and hyperbole on both sides have marred recent debate. Of importance for this article is not whether Albert Wohlstetter has been fair to Herbert York,[25] or vice versa,[26] still less which of the two is correct. Rather is it important that some students of strategy ar beginning to consider — in some cases to re consider after a long period of conceptu rigidity — the adequacy and even the validit of the strategic wisdom that was generated i the decade 1955–1965. This wisdom was cod ified, became fashionable, and was *the* set o respectable opinions in the middle and lat 1960s.[27] Until very recently, it could be sai that "the terms in which the area of nuclea weapons policy is discussed consist mostly o a rigidification of ten- or twenty-year-old doc trine."[28] In other words, we have been livin off our strategic theoretical capital. As a number of the works cited in this article attest, the protracted SALT experience has revealed the undue narrowness of our strategic concepts. The Emperor has no clothes for a new era. Nonetheless, much of the evidence to which strategic contenders refer is inherently ambiguous, or even unknowable.

Much of the babel of approval and disapproval that marked the announcement by former Secretary of Defense Schlesinger of a revised firing and targeting doctrine for the strategic war plan (the Single Integrated Operational Plan — the SIOP) was little more than the ritual utterances of rival strategic ideologies. Beneath the competing prescriptions for an effective negotiating posture for SALT, the charges that Dr. Schlesinger's limited strategic options would be "destabilizing," and the disagreements about the strategic and political value of technologies recommended in the FY's 1975, 1976, and 1977 defense budgets, lurk the following questions: Upon what premises does the proposition rest that some hard-target counterforce capability is destabilizing? Is stability a quality inherent in certain technological relationships, or is it a very subjective quality liable to strategic ideological variations in meaning?[29] What functions do super-power elites believe to be performed by

[21] Prominent examples of this argument may be found in Wolfgang K. H. Panofsky, "The Mutual-Hostage Relationship Between America and Russia," *Foreign Affairs*, 52 (October, 1973), 109–118; Herbert Scoville, "Flexible MADness?" *Foreign Policy*, 14 (Spring, 1974), 164–177; George W. Rathjens, "Flexible Response Options," *Orbis*, 18 (Fall, 1974), 677–688; and Jerome H. Kahan, *Security in the Nuclear Age: Developing U.S. Strategic Arms Policy* (Washington, D.C.: Brookings, 1975), chapter 6.

[22] See Colin S. Gray, "The Arms Race Is About Politics," *Foreign Policy*, 9 (Winter, 1972–73), 123–127.

[23] *Cold Dawn*, p. 9. Stability may be "a truly divine goal," but—in common with such other divine goals as peace and order—its empirical referents and the proper path to its attainment are far from being self-evident.

[24] See Panofsky, "The Mutual-Hostage Relationship Between America and Russia," p. 113; and Scoville, "Flexible MADness," pp. 168–170. On the fighting retreat currently being conducted by MAD adherents, see Albert Wohlstetter, "Threats and Promises of Peace: Europe and America in the New Era," *Orbis*, 17 (Winter, 1974), 1134–1138.

[29] See Robert L. Pfaltzgraff, Jr., "The Rationale for Super-power Arms Control," in Kintner and Pfaltzgraff, p. 4. For contrasting policy positions that share a devotion to a very technical understanding of stability, see the contributions by Richard Garwin (chapter 4) and Richard Perle (chapter 5) in Kaplan, *SALT: Problems and Prospects*.

strategic weapon arsenals? What drives the nuclear arms race, and from such an analysis, how can SALT reasonably be expected to induce reciprocal arms-race restraint? Any competent analyst is able to produce a good case for a variety of policy prescriptions, but such should not be his function — that is not what should be meant by a more *relevant* political science. If the so-called "post-behavioral revolution" in political science is to refer to anything that merits the title of scholarship, it must be to the systematic exploration of areas relevant to public policy.

The SALT Experience

Although SALT began in November 1969 and has brought forth three principal bursts of agreement (May 1972, June 1974, and November 1974) and a series of minor accords,[30] confident answers to the question posed by Bernard Brodie as the title of the first chapter of his magisterial study, *War and Politics* — "De quoi s'agit-il?" are in short supply.[31] The voluminous SALT literature yields such assertions as that SALT is *about* the meaning of deterrence; the codification of mutual deterrence via MAD doctrine; the ratification of parity; the future of détente; the curbing and eventual reversal of the nuclear arms race; the fashioning of a more cost-effective strategic posture; and the balance of bureaucratic power in Washington and in Moscow. The whole truth about SALT is to be discovered neither in the only extant "inside" account of American decision making—John Newhouse's *Cold Dawn* — nor in the less privileged prose of more scholarly analysts. It would seem that practically an entire generation of American arms controllers has expected the Soviet leadership to behave like a slightly backward collective American arms controller. These negative thoughts are prompted by the multitude of worthy, naive, and — for the Russians — rather insulting assertions that have studded the SALT, and more general strategic, literatures of recent years.[32]

For a blow-by-blow account of SALT policy making in Washington and of SALT negotiations in Helsinki, Vienna, Washington, and Moscow there is, unfortunately, no substitute for, or reliable cross-check upon, John Newhouse's book, *Cold Dawn.* Although many details of the United States' evolving negotiating stance in SALT I were revealed via the self-serving leak to such well-connected journalists as William Beecher (then) of *The New York Times*[33] and Chalmers Roberts of *The Washington Post, Cold Dawn* is no mere collage of previously revealed material. The book is indispensable as a behind-the-scenes interpretation of the history of SALT, but only in a very limited sense could one endorse the publisher's jacket blurb, which claims that *Cold Dawn* is "The Definitive and Revealing Account of The Strategic Arms Limitation Talks." Even allowing for commercially motivated hyperbole, readers' credulity should be restrained by two factors. First, although Newhouse was granted unique (in the SALT context) investigative privileges in interviewing Washington policy makers and in perusing many very sensitive documents (for example, *possibly* some NSSM's and NSDM's),[34] there is no way in which we are able to check his interpretations against his sources. In other words, only a person with full access to SALT personnel and documentation could assess the degree to which Newhouse was granted free-range privileges and the extent to which his sources were deployed in print in a balanced

[30] The texts of all of the SALT—and SALT-related — agreements through and including the results of the Brezhnev visit to the United States in June 1973, may be located in Willrich and Rhinelander, Appendices 1–10. A useful SALT bibliography is provided on pp. 348–354. Documentation on the Vladivostok accords is in *Survival,* 17 (January/February 1975), 32–33.

[31] (New York: Macmillan, 1973), pp. 1–28. Brodie attributes the question to Marshal Foch (p. 1).

[32] For example, see Roman Kolkowicz et al., *The Soviet Union and Arms Control: A Superpower Dilemma* (Baltimore: The Johns Hopkins University Press, 1970), pp. 34–37.

[33] The most notorious, or celebrated, of these leaks was the so-called "Beecher leak" of July 23, 1971. See *The New York Times,* July 23, 1971; Newhouse, *Cold Dawn,* pp. 224–225; and the testimony of Elliot L. Richardson in Senate Committee on Foreign Relations, *Nomination of Henry A. Kissinger,* Hearings, Part 2, 93rd Cong., 1st Sess. (1973), pp. 276–277. A more recent example of a major leak is Aaron Latham, "Kissinger's Bluff Is Called," *New York Magazine,* 9 (April 12, 1976), 30–35. In this article the author claims to reveal how Kissinger negotiated very poorly indeed over cruise missiles and the *Backfire* bomber during his visit to Moscow in January 1976. Strong circumstantial evidence supports Latham's case, but the absence of specified sources for SALT leaks means that they must be regarded skeptically.

[34] NSSM: National Security Study Memorandum; NSDM: National Security Decision Memorandum. For Kissinger's version of what Newhouse was and was not permitted to investigate from original sources (human and documentary), see *Nomination of Henry A. Kissinger,* Part 1, pp. 109–112; and *ibid.,* Part 2, pp. 330–332. A very different perspective upon the access granted to Newhouse has been provided in William R. Van Cleave's review of *Cold Dawn,* "The SALT Papers: A Torrent of Verbiage or a Spring of Capital Truths?", *Orbis,* 17 (Winter, 1974), 1396–1401.

fashion. Second, *Cold Dawn* is a strongly committed work.[35] Naturally enough, Newhouse was granted access precisely because he was known to be trustworthy — a safe and friendly writer.

Newhouse has written a most valuable work, Nonetheless, a more skeptical writer granted similar in-house privileges should have been able to write a more balanced and a more valuable work. In the face of unknowable Soviet motivations (possibly uncertain and confused even to the Soviet leaders themselves), Newhouse does not admit that there might be a variety of tenable propositions; rather he plugs the lacunae with American arms controller-style Russians. Whether or not one shares Newhouse's strategic beliefs, it is difficult to excuse statements such as the following: "The talks were launched, not from a common impulse to reduce armaments, but from a mutual need to solemnize the parity principle—or, put differently, to establish an acceptance by each side of the other's ability to inflict unacceptable retribution in response to a nuclear attack";[36] ". . . both great powers want to stabilize spending on arms";[37] "Each [Super Power] assumes the other is negotiating because parity has been achieved.[38]
